Another interesting feature noted was through service from Rockford, Illinois, to Chicago, inaugurated by the Rockford and Interurban, the Elgin & Belvidere Railway, and the Chicago, Aurora & Elgin Railroad. Without any increase in operating expenses these three companies so arranged their schedules that fast through service over a distance of 90 miles is being given, and by making the rate 2 cents per mile instead of the steam railroad rate of 3.6 cents per mile a very satisfactory proportion of the available business is being secured, in spite of the disadvantage of slower running and lack of baggage accommodations.

In freight transportation the Chicago, North Shore & Milwaukee Railroad and the Illinois Traction System are showing real progress. The former road handles principally merchandise despatch or less than carload freight and has built up the business to a point where it represents 20 per cent of the gross revenue. The Illinois Traction System handles all classes of freight and now has reached a point where its freight business is 40 per cent of the gross revenue.

Both the Chicago, North Shore & Milwaukee and The Milwaukee Electric Railway & Light Company are operating extensive interurban bus schedules, in some cases over extremely long routes, and on account of being in the field themselves, have very little, if any, competition.

District No. 6 — Southwestern: (Kansas, Missouri, Oklahoma, Arkansas, Louisiana, Texas and Colorado.)

By V. W. Berry

General Superintendent Northern Texas Traction Company, Fort Worth, Tex.

Although this section covers a great area, there are only thirty-two interurban companies, and these are scattered over the entire district. Unfortunately, it has been impossible for me to personally visit all these companies during the past year, but I have been able to visit the larger ones, and with the smaller companies the work of the committee has been carried on by correspondence.

A great deal of good was derived from the publicity issued early in the year through Association headquarters, and the committee work in this section was vastly aided by the information published in trade journals, state public service information bureaus and daily newspapers.

In all the companies there was a disposition to assist the work of the Committee, and in every company visited there was manifested hearty co-operation. However, many of the local operators took the attitude that your representative was a sort of doctor who could prescribe the cure for whatever disease affected their properties. We had to confine ourselves to pointing out the remedy used by some other operator in somewhat similar circumstances. In disseminating information of this character we found a great need for a handbook of electric railway practice, such as is now being issued.

In every case the interurban companies in this section are making every effort to furnish the best service of which they are capable, although local conditions in the various places make impossible a single standard of service. All are, however, keenly interested in modernizing their roads and are making every improvement which their finances permit. In order to modernize their service, new and up-to-date rolling stock, including in a few instances light-weight one-man cars, is being installed to replace heavy and antiquated equipment. Automatic substations are gradually replacing manually operated substations, and in this section during the last year approximately 100 miles of new interurban line has either been put into operation or construction has been started.

Many of the roads have been subjected to unfair automobile competition and this has been reflected in the companies' finances. However, by using modern merchandising methods and improving service by modernization of equipment, this competition has been considerably reduced, and in many cases entirely eliminated. Where local conditions permit, aggressive campaigns have been made to secure additional freight business, and this is proving a profitable source of revenue.

Bus operation, as a feeder for interurban lines, has been considered by many of the companies in this section, and several have already started operation of this class of equipment.

Subjects and Meetings

THE committee on subjects and meetings made the following recommendations with reference to the subjects that should be studied during the coming association year. Its report was presented at the final meeting of the old executive committee of the American Association.

Modernization — The committee on city operation and the committee on interurban operation in their joint report to the 1924 convention recommend the consolidation of these committees. This suggestion was approved and the committee recommended that this work be carried on. It is further suggested that the consolidated committee be designated during the coming year as the "Committee on Management and Operation."

Valuation—The committee on valuation in its report to the 1924 convention recommends attention by the Accountants' and Engineering Associations to certain phases of the valuation problem. The subjects and meetings committee recommended that a joint committee or sub-committee of the American, Accountants' and Engineering Associations be formed to handle the particular matters in which the accountants and engineers can assist the valuation committee. It was recommended that the valuation committee be instructed to continue its study.

Special Taxes — While this subject has been covered from year to year, special taxes are always with us and the public should not be permitted to forget their effort upon fares and service. Accordingly, it was recommended that the committee on special taxes be continued and that it review again the unjust burdens which railway companies have to bear.

Education — Recommendation was made that this committee be continued and that further efforts be made toward obtaining greater co-operation from technical and public schools and also greater attention on the part of the companies to the education of their employees.

Survey of Community Transportation Needs—The subjects and meetings committee recommended that a committee to be designated "Committee on Community Transportation Requirements" be appointed, and that this committee embrace in its activities the work heretofore performed and that recommended to be performed in the future by the committee on unification and co-ordination of all forms of local transportation. It is suggested that this committee consider the need for a survey of the transportation requirements in local communities and indicate general principles along which such surveys may be conducted. Such a survey should reveal whether transportation service and facilities are being provided in each community commensurate with the requirements in its various sections. The association has had three reports dealing with the place of the motor bus in mass transportation and the position of the industry on this question is well established. The subjects and meetings committee declared its belief that we now might go further and consider how all the various means of mass transportation may be used to best advantage.

Committee on Bus Franchises—It is recommended that a special committee be appointed to study the form of franchises or permits best suitable for the establishment of bus routes, having in mind the association's policy of coordination.

Committee on Co-operation with Manufacturers — This committee has beein doing very effective work in the assistance of manufacturers in telling the story of the electric railways to the public. It is recommended that the work of this committee be continued.

Committee on Rapid Transit — This committee was newly organized rather late in the association year and has not had a sufficient opportunity to complete its work as indicated in its report. It is recommended that it be continued and instructed to proceed along the lines heretofore suggested.

Committee on Mail Pay—The work of this committee is limited to its presentation of the application for increased rates before the Interstate Commerce Commission, which is now pending. It is recommended that the committee be continued.

Insurance Committee—This committee has in individual instances been able to assist companies in securing reduction in rates. It is recommended that the committee be continued.

Committee on Uniform Regulatory Laws—This committee was newly organized at the beginning of the year and has not had an opportunity to develop this subject. It is recommended that it be continued.

Charles A. Coffin Prize Committee—It is recommended that this committee be authorized for the coming year.

Committee on National Utility Associations—It is recommended that the work of this committee be continued.

The report was signed by H. L. Brown, J. K. Choate, H. C. Clark, F. W. Doolittle, E. C. Faber, G. H. Harries, C. S. Howley, W. H. Hyland, H. A. Johnson, C. W. Kellogg, J. K. Punderford, A. S. Richey, E. M. White and F. R. Coates, chairman.

Canadians Discuss Next Convention

THOSE members of the Canadian Electric Railway Association who attended the Atlantic City convention held a meeting Oct. 7, which was attended by 21. The meeting was called to order by Walter R. McRae. After the minutes of similar meetings held at Atlantic City last year were read by Secretary Eustace Smith, Jr., the following committees were announced:

Valuation, Maintenance and Depreciation of Street Railway Assets.—H. E. Weyman, manager Levis County Railway, chairman; W. S. Hart, Quebec; W. G. Hewson, Toronto; L. Tait, London; G. E. Waller, Hamilton; H. R. Mallison, Montreal, and H. C. Patten, Toronto.

Safety.—W. R. Robertson, general superintendent Hydro-Electric Railways, Toronto, chairman; W. H. Darracott, Winnipeg; W. R. McRae, Toronto; R. M. Reade, Quebec; J. F. H. Wyse, Toronto; G. E. Waller, Hamilton, and A. Gaboury, Montreal.

Motor Truck and Bus.—Maj. F. D. Burpee, manager Ottawa Electric Railway, chairman; C. H. Dahl, Winnipeg; G. Gordon Gale, Hull; W. G. Murrin, Vancouver; W. R. Robertson, Toronto; I. S. Fairty, Toronto, and A. H. Foster, Brantford.

Legislation. — Maj. F. D. Burpee, manager Ottawa Electric Railway, Chairman; W. L. Weston, Halifax; J. A. Olive, St. John; N. B.; G. E. Tanguay, Quebec; C. L. Wilson; Toronto; E. Anderson, Winnipeg; D. W. Houston, Regina; C. J. Yorath, Edmonton, and V. Laursen, Vancouver.

Standards. — D. E. Blair, superintendent of rolling stock Montreal Tramways Company, chairman; E. P. Coleman, G. Gordon Gale, Hull; H. T. Gibbs, Hamilton; W. G. Gordon, Toronto; Hugh Millar, Montreal; W. G. Murrin, Vancouver, and W. R. McRae, Toronto.

At this point W. R. Robertson entered and took the chair. The resignation of C. J. Yorath, city commissioner for Edmonton, who acted on the association's legislation committee for that province, was announced unofficially.

Chairman Robertson called attention to the questionnaires which have been sent out to member companies, one dealing with the testing of hearing and eyesight of employees, and the other dealing with the practices in effect in regard to exterior advertising on street cars. He desired to impress upon member companies the importance of getting answers to these and other questionnaires as early as possible on account of the value of the information to the association.

The meeting place for the 1925 convention was discussed. Invitations have been received from Niagara Falls, Windsor and Winnipeg. Charles Currie, president London Street Railway, London, Ont., extended an invitation to the association to hold the meeting there next year. The question also arose as to whether the convention would be held in connection with the Canadian Electrical Association. It was the sense of the meeting that a joint convention would be desirable and the members present expressed themselves in favor of London. This information will be given the executive committee for its use.

The chairman announced the resignation of C. B. King as auditor of the association, following his resignation as manager of the London Street Railways. Mr. Fairty moved that the secretary draft a letter of regret to Mr. King on the occasion of his resignation.

J. F. Neild moved that the thanks of the Canadian Association be extended to the American Electric Association for the courtesies extended in connection with this convention and in placing facilities at its disposal for today's meeting.

Broad Economics of Employee Ownership[*]

By T. N. Carver

Professor of Economics, Harvard University

Labor and Capital Now in Process of Economic Evolution — Employee Stock Holdings in Their Companies Now Runs Into Millions—Modern Business Improves by Increasing Rather than by Decreasing the Supply of Capital

THE World War produced a number of political revolutions in Europe. It has not yet produced an economic revolution. A number of old governments have been overthrown and new ones set up in their places. In some cases this resulted in a temporary economic débâcle, but wherever industry has begun to function again it looks so much like that which existed before the revolution as to be difficult to distinguish from it. No significant improvement over the old forms of industry has yet been produced in any European country by any of these political revolutions. Their ultimate effects go no deeper than those that follow the ousting of one gang of politicians from the government of an American city and the substitution of another.

The only economic revolution now under way is going on in the United States. It is a revolution that is to wipe out the distinction between laborers and capitalists by making laborers their own capitalists and by compelling capitalists to become laborers of one kind or another, because not many of them will be able to live on the returns from capital alone. This is something new in the history of the world.

The labor movement in this country is passing out of the stage in which leadership concerned itself mainly with the immediate tactics of battle. It is passing into the stage where it is concerning itself with the higher strategy of labor. This higher strategy takes account of the permanent economic forces and puts labor in a position where these forces work for it rather than against it. Instead of fighting capital they are beginning to recognize its power and to use it as an implement for their own improvement. There are at least three kinds of evidence that indicate roughly the extent to which laborers are becoming their own capitalists in this country: first, the rapid growth of savings deposits; second, the investment by laborers in the shares of corporations; third, the growth of labor banks.

T. N. Carver

Some idea of the financial power of laborers may be gained by a reasonable interpretation of the statistics regarding savings deposits, the assets of building and loan associations and the premiums of insurance companies. The total figures as given by the Department of Commerce are:

For savings deposits of all kinds on June 30, 1923	$15,260,959,300
For total assets of building and loan associations	3,342,530,953
Add to these the total amount of life insurance premiums paid during the year of 1922	2,336,444,586
Total	$20,939,934,839

Of course, these savings are not all made by manual workers. Probably a relatively small proportion of the life insurance premiums are paid by them; but it is known that a fairly large proportion of savings deposits and payments to building and loan associations are by working people. Discount this as much as we dare, it is still a fair inference that the share of working people in the twenty billions of savings will at least be somewhere in the billions. Any day the laborers decide to do so, they can divert a few billions of savings to the purchase of the common stock of industrial corporations, railroads, and public service companies, and actually control them. This is not necessarily a good policy, but it is within their power to do so if they decide that it is to their interest.

As to the investment of laboring people in the shares of corporations, some interesting figures are available, though the half has not yet been told. The *Financial World* recently sent a questionnaire to 1,000 of the leading corporations of the country for the purpose of finding out how far the movement had progressed. Only 129 replies were returned. Of these 104 showed that employees below the grade of officials owned stock, though 118 of the replies stated that the management favored the plan. Of those that showed employee ownership, only 54 had offered special inducements to persuade employees to buy stock. What are known as public utility corporations showed the strongest tendency toward the plan.

The largest number of employee stockholders in any single industrial corporation is 50,020, owning 689,703 shares. Two others show 15,000 employee stockholders each, owning in one case 450,411 shares and 200,000 in the other. One smaller corporation reports that all its common stock is owned by its employees, but does not tell how it is distributed between the official class and the manual workers. Another reports that 12,000 of its 18,000 employees own stock. Still another reports that 3,000 of its 6,000 employees own $2,500,000 worth of stock. A number of corporations that did not reply to the questionnaire are known to have a considerable number of employee stockholders.

Of the 171 public utility corporations listed, 33 replies were received, 32 of which report employee stockholders. One reports that 94 per cent of its employees own from 1 to 50 shares each; another that 149 of its 151 employees own stock; still another that 510 of its 543 employees own 5,211 shares. The most striking case, however, is a well-known traction company all of whose 11,500 employees own stock amounting to 120,000 shares. One company reports that none but officers own stock.

Among those that did not reply to the questionnaire, the Southwestern Bell Telephone Company has published in its annual report the statement that

"The Employees' Stock Purchase Plan, under which employees may subscribe for capital stock of the American Telephone & Telegraph Company on favorable terms, continues in effect. On Dec. 31, 1923, more than 5,900 employees were subscribing for 17,496 shares. Since the introduction of the existing plan in May, 1921, more than 14,000 employees have exercised their privilege of participation and a large percentage of employees of your company already are shareholders of record. The plan provides not only a means for acquiring a high-grade investment stock but as well a means for promoting systematic saving."

A report on employee thrift and savings plans, prepared by the policyholders' service bureau of the Metropolitan Life Insurance Company, mentions a number of other companies in which the plan is in operation, in one of which—a large motor company—94 per cent of the employees are participating in the plan for employee stock ownership. In a large soap manufacturing company, 60 to 85 per cent of the employees own $1,600,000, par value, of stock. This report shows that a considerable number of companies that did not reply to the questionnaire of the *Financial World* are making use of the plan.

In the chapter on The Workman as Stockholder in "Labor's Money," by Richard Boeckel, the following information is given:

"Twenty-one thousand of the employees of Swift & Company, constituting more than one-third of the total number of men and women employed by the company, hold Swift shares with a total par value exceeding $21,000,000.

"Ninety-four thousand of the employees of the American Telephone & Telegraph Company are making payment in installments upon stocks subscribed under the company's profit-sharing plan. Of this number approximately 46,000 hold shares upon which payment has been made in full.

---

[*] Abstract of a paper before the annual convention of the American Electric Railway Association, Atlantic City, N. J., Oct. 6-10, 1924.

"The E. I. du Pont de Nemours Company has distributed stock valued at $20,765,999 among its employees since the inauguration of its plan. The total distribution in 1923 amounted to 14,484 shares with a total par value of $1,448,400.

"Six thousand employees of the General Motors Corporation, one out of every 12 employed, hold 270,000 shares of common stock in that corporation, valued in excess of $4,000,000.

"Employees of Sears, Roebuck & Company own 55,700 shares in that enterprise, purchased through the employees' profit sharing fund, and 77,600 shares purchased outside the fund.

"Seventy per cent of the workers employed by the International Harvester Company hold common stock in the company, the aggregate value of their holdings exceeding $5,000,000.

"Practically every workman employed by the Procter & Gamble Company is a shareholder in the enterprise. Ninety per cent of the employees of the Firestone Tire & Rubber Company are stockholders. Every third man in the employ of the Goodyear Tire & Rubber Company holds one or more shares of stock.

"Other corporations in which employees hold large blocks of stock include the Standard Oil companies, the General Electric Company, the Westinghouse Electric & Manufacturing Company, the Eastman Kodak Company, the J. B. Stetson Company, the National Lead Company, the National Biscuit Company, the Republic Iron & Steel Company, and the Studebaker Corporation.

"The United States Steel Corporation, called by Samuel Untermyer 'the greatest enemy to industrial peace in America,' was a pioneer in employees' stock distribution. The corporation was chartered in 1901. Its stock subscription plan was put into operation in 1903. In every year but one since 1903 the corporation has offered large amounts of its stock, bought in the open market, for subscription by its employees. In the beginning only preferred stock was offered, but offerings since 1916 have all been of common stock. Employees are allowed three years in which to pay for stock subscribed. An annual bonus of $5, in addition to the regular dividends, is paid to each employee holding his stock for a period of five years. In recent years all the corporation's offerings to employees have been largely oversubscribed.

"Owing to the meager reports it is impossible to give any satisfactory figures as to the total amount invested by American workingmen in the stock of the companies that employ them. About all that can be said is that it clearly runs up into billions of dollars."

THE LABOR BANK AN IMPORTANT NEW FACTOR

In addition to the accumulation of savings by working people and the investment in the stock of corporations we have in this country a strikingly new phenomenon in the form of the labor bank. The general facts regarding them are well stated in "Labor's Money," by Richard Boeckel. According to a recent statement of Warren S. Stone of the Brotherhood of Locomotive Engineers, there are thirty labor banks now in existence in this country and many more are organizing. They already have resources of $100,000,000 and are doubling these resources every year. The movement has already developed far enough to have its own organ, a well edited and prosperous journal, called the *Labor Banker*. Its editorials and articles compare favorably with those of other financial journals, and it shows a practical common sense, worthy of a disciple of Benjamin Franklin.

Where else in the world is it possible today to find anything corresponding to these labor banks?

If we add to the savings of laborers their investments in the shares of corporations and the funds in the labor banks, the large funds already in the treasuries of the labor unions, we will begin to see that the financial power of the American laboring people is a factor to be reckoned with. All good citizens who are interested in the expansion of American industries should take account of this. Here is a new source of capital that may be so directed as to increase the productive power of the country and to create an additional demand for labor. Every time the laboring people of this country materially increase their savings and sound investments, they are helping themselves in two distinct ways. In the first place they are gaining a new source of income. In addition to this, and perhaps more important, there is the effect upon the labor market. The more capital there is seeking investment, the more easily can new and productive enterprises be financed. The more new productive enterprises that are properly financed and put in operation, the more jobs there are calling for men, the higher the wages of labor will be, and the less unemployment there will be. Laborers are beginning to appreciate this and to engage in what may be called the higher strategy of labor.

ECONOMIC STRATEGY DISPLACING PRIMITIVE FIGHTING

At this point we should stop to notice the essential difference between primitive fighting tactics and the higher economic strategy. In primitive warfare you gain in proportion as you thin out your enemies. The more uncomfortable you can make it for them, the fewer there will be of them and the better it will be for you. All our ancestors for thousands of years had to think in these terms. It will take some time to breed this idea out of our people. The clear, cold fact is that in the modern economic world you gain in proportion as you increase the number of your enemies on the market.

Take the simple case of producer and consumer. When they are dickering over prices they are opponents. If they become irritated at one another, they are likely to fall back into the old way of thinking and try to treat each other as enemies. If the producers are dominated by this ancestral habit of thought, they will hate all consumers.

"Hates any man the thing he would not kill?"

It is, of course, obvious to the most elementary student of economics that what producers should do if they knew their own interest would be to try to increase the number of consumers. What they are very likely to do when they become angry is to try to thin them out.

SUGAR AND CRANBERRIES

During the sugar shortage of the war, the cranberry growers on Cape Cod had difficulty in selling their cranberries. The scarcity of sugar almost destroyed the demand for cranberries; the reason being that people do not want cranberries, they want cranberry sauce, and cranberry sauce is not made of cranberries alone; it is made of cranberries and sugar. If one ingredient in that delectable compound is missing, the other is not of much use.

Suppose the cranberry growers had been incensed because of the low price of cranberries and the high price of sugar, and had acted naturally, according to the principles of behaviorism. They would have started some sort of a war against sugar importers and refiners and would have made it uncomfortable for them, and probably driven some of them out of business. Every student of economics knows that while this might be a perfectly natural procedure, it would not do the cranberry growers any good; in fact it would do them harm. They would merely be engaged in the very common practice of biting off their own noses to spite their faces.

This is the principle that runs through all our economic life. Goods are not produced by labor; they are produced by labor and capital. If one ingredient is missing, there is not much demand for the other. In proportion as capital is scarce relative to the labor supply, in that proportion will capitalists be well off and laborers badly off. What the laborers really need is more capital. This is just as clear and definite as that the cranberry growers in the former illustration needed more sugar. When the laborers begin to think in terms of the higher strategy, they will be trying to increase the quantity of capital. They can do this both by increasing their own savings and by encouraging saving on the part of other people.

In terms of the higher economic strategy, every encouragement, of course, should be given to laborers to organize their own banks and to run those banks as banks ought to be run, by safeguarding the capital of depositors and financing real, productive enterprises. But it is also to the interest of labor that other banks should be started to do the same thing. The more banks there are performing these two essential functions, the more capital there will be available for the financing of new and productive enterprises.

If there is enough capital in the country and there are enough wise investors, no really productive enterprise will ever fail to secure adequate financial backing. When that happens, there will be so many productive enterprises in operation as to create a greatly increased demand for labor. This will put labor in a position of great strategic advantage. In other words, this is one of those cases where it is to the interest of labor to increase the number of its so-called enemies. In proportion as laborers learn to think in terms of economics rather than in terms of the cheap demagogics that is taught them by so many loquacious persons, they will begin to see the advantage of encouraging every possible accumulation of capital from every possible source.

If our labor leaders and those who are trying to become labor leaders will continue to think and act more and more in terms of the higher economic strategy, decreasing the supply of those forms of labor that are oversupplied, increasing the supply of capital and business management, favoring policies that will expand industry and so make it possible for laborers to become their own capitalists, there is scarcely any limit to the prosperity that may come to our laboring classes without a single essential or fundamental change in the institutions of the country or in the basic principles of the economic system. We can have what to all intents and purposes might be called a practical equality of prosperity without surrendering the principle of voluntarism under which we are now proceeding. We shall have much greater prosperity for all classes than can possibly be secured under any system of compulsion such as they are trying in Russia and such as the British Labor party, if it lives up to the previously published opinions of its leaders, will eventually try.

SHOULD LABOR OWN THE SHOPS?

It has long been the dreams of social reformers that laborers would own the shops and factories in which they work. There are reasons for doubting that this would be as desirable from the standpoint of the workers as some have imagined. It is true that the workers would get the profits, if there were any, but it is equally true that they would also bear the losses if there were any. On the whole, losses are almost, if not quite, as common as profits.

Granting, however, that it would be desirable for the workers to own the establishments in which they work, there are three ways—two dishonest or revolutionary, and one honest—by which they may acquire them. The first and most direct of the dishonest methods is to seize them by force. This is the method openly advocated by the so-called "direct actionists" and practiced by the Bolsheviki. Aside from the dishonesty of it, this method has serious drawbacks. The government must first be overthrown. Even then, the situation is not secure. Though this plan may put the present property in the hands of the worker, it cannot renew the property when it is worn out. There will be no new property to seize. People who never had enough thrift and forethought to buy and pay for property in the first place seldom have enough to keep the property up after they have gained it in some other way. When it runs down, there will be nothing to steal with which to keep up repairs. This the Bolsheviki have already discovered to their discomfiture.

Another dishonest way is to gain possession of the government and use its power to dispossess the present owners. This is frankly advocated by some of the Guild Socialists. It is to be done under the form of constitutional government, instead of in defiance of government. In the end, it will make little difference whether the force that is used to take property from one set of owners and give it to another is wielded by persons outside the government or by a perversion of government power.

If laborers want to own the shops in which they work, there is an honest way. It is the way by which they may own the houses in which they live, their clothes, their household furniture, or anything else that they have not themselves made. That is, to buy and pay for them as other people do. Even if they could take possession of the shops by force, they could only get repairs and replace worn-out plants by this method. There is no sound reason why they should gain possession of existing shops in any other way.

A FEW MISSTATEMENTS CHALLENGED

One of the strangest examples of the perverseness of the human mind is the tendency to misstate, or to accept without challenge, the misstatement of others, regarding the relation of the worker to his tools. One of these misstatements is that the industrial revolution of the eighteenth century deprived manual laborers of the ownership of their tools. Of course it is impossible to deprive a person of ownership of something which he never owned. The new tools that came into existence with steam-driven machinery never were owned by manual workers. For the first time in history they are in process of becoming in this country largely the property of those who work with them.

Another misstatement is that through government ownership the workers would become, in effect, the owners of the plants in which they work. The employees in the city hall do not own the city hall; the public school teachers do not own the school buildings. The employees of the federal government do not own the buildings or the navy yards in which they work. Moreover, the employees themselves in those publicly owned plants do not feel that they are working for themselves or show any more interest in their work than do the employees in capitalist owned plants.

A third misstatement is to the effect that property in tools, machines and industrial plants differs fundamentally from property in dwelling houses, furniture, clothing, cooking utensils and other things commonly classed as consumers' goods. If it is found desirable that any class should own its own dwelling houses, household furniture, or clothes, the method of purchase is open. If it is found desirable that another class should own the land, livestock, and farming implements with which it works, the method of purchase is alike open. If it is found desirable that still another class should own the factories, shops, tracks or rolling stock with which it works, the method of purchase is open in this case also. When these various people buy the property in which or with which they work, they acquire a genuine ownership, and they will at once realize a significant difference between this and government ownership.

Another misstatement is to the effect that modern industrial plants are too big to be owned by their own workers. The joint stock form of business organization was not designed primarily for the benefit of manual workers, but it would not have been much different from what it now is if it had been. Neither state socialism, guild socialism, sovietism, nor the ordinary co-operative society presents a plan of organization so well suited to the needs of workers who desire to own their own plants as does the joint stock corporation.

An interesting bit of practical experience with this form of organization was furnished many years ago by the Oneida Community. This community was formerly, as most of you know, a communistic society of the most idealistic sort, having been founded by a religious group who were known as perfectionists, and who believed that, for them, the Kingdom of God had already arrived. It continued as a communistic society for about thirty years and then changed over to a New York State joint stock corporation with a capital of $600,000, on a plan agreed to by all the members, whereby the shares in the new corporation were divided among men and woman equally and according to years of membership in the community. The business of the community has grown to such magnitude that only a fraction of the work is done by actual members. However, they have been selling common stock to employees for a number of years.

Here was a communistic society that was actually succeeding. Its business was growing and prospering. Yet its members decided that the joint stock form of organization fitted their plans better, and apparently fulfilled their ideals satisfactorily. It is mentioned as an illustration of the writer's belief that this form of ownership supplies the American laborer with all he needs if he seriously desires to share in the ownership of the plant in which he works.

EMPLOYEE OWNERSHIP IS ESPECIALLY DESIRABLE WITH PUBLIC UTILITIES

As indicated above, the public service corporations showed a higher tendency than any other single class toward employee ownership. One reason for this is probably because in no other class of business does good will count for so much; or perhaps it would be better to put it thus: that in no other class of business does the ill will of the public prove so dangerous. "Where the carcasses are, there will the eagles be gathered together." The politician, from this aerial lookout, is always watching for evidences of popular discontent. Absentee ownership, whether of land or other property, is universally a source of dissatisfaction and irritation. In the case of absentee landlordism, it has never yet failed to produce friction and hostility between the resident population and the absentee land owners, but this result and the conditions which produce it are not peculiar to agricultural people. They are found in the case of urban property and urban business, as well as in the case of rural property and rural business.

We may approve or disapprove but we cannot deny the fact that absentee owners of any business furnish the conditions on which the politician thrives. In the case of public service corporations he has a peculiar hold upon the business. In a democracy we cannot get rid of the politician. The only alternative is to substitute so far as possible resident ownership for absentee ownership. The form of resident ownership which is most disconcerting to the politician is that which is known as employee and customer ownership. When the employees of a traction company own a large part of the business, the politician cannot appeal to the feeling between capital and labor, because the laborers are their own capitalists. It there were no other reason in favor of employee ownership this would be sufficient to justify it. Customer ownership in other cases, such as telephone companies, accomplishes the same purpose. The attempt to combine employee with customer ownership may have its difficulties. The interests of customers and employees are sometimes in conflict. This may lead to complications and stimulate party politics among the shareholders, but we may well run the risk of this if we can only avoid the menace of that bane of every constructive business, the cheap politician.

Another reason why public service corporations are suitable for the experiment of employee ownership is that the product is locally consumed and the employees therefore can easily visualize the business problem of marketing. In a sense, every street car conductor is a salesman for the street railway company.

He is in direct contact with the customers of the company. If he is not only a worker but a part owner in the company, he can be expected to become a somewhat better salesman, or at least to be somewhat more eager to please the public with whom he is in daily contact. The workers in a shop who produce a commodity that is not consumed locally but sold over the entire world are not likely to visualize quite so clearly the strictly business problems which confront the company.

There is some slight danger that employee ownership in a case of this kind might result in short-sighted policies unless the employees are unusually intelligent. Even this danger could probably be overcome by taking somewhat greater pains to acquaint the employee shareholders with the possible problems involved in marketing the product than would be necessary if the shares were all held by a few expert or far-sighted business men.

*Railway Securities Can Be Sold Locally**

By C. W. Kellogg

Stone & Webster, Boston

Discussion of Paper by Prof. Carver Points Out Three Reasons Why Quality of Electric Railway Securities Has Been Re-established—Believes Railways Have Advantages Over Power and Gas Companies in Customer Financing

UP TO this time the sale of securities by public utilities to their customers and employees has been confined principally to electric light, power and gas companies. The reason for this has been that by and large in recent years the companies in question have been better able than the electric railways to make a financial showing that would give their securities an attractive appearance as investments.

Looking at the electric railway industry broadly, it is clear that the developments of recent years have been such as to place railway companies in a much stronger financial position. Three major factors have contributed to the improvement, each of which is of fundamental importance to the industry:

First—The constant increase in traffic in the face of the enormous increase in the use of automobiles proves that the electric railways fill a definite public need for transportation. Census figures show that from 1912 to 1922 the revenue passengers of electric railways increased 35 per cent, while the population of cities of more than 25,000 inhabitants increased 27 per cent. From 1912 to 1923 the automobiles registered in this country increased from 1,010,000 to more than 15,000,000, an increase of 1,385 per cent. The fact that the railways, in spite of this enormous competition, have increased not only their passengers, but even their passengers per capita, is certainly most promising to the future of the industry.

Second—The progressive increase in fares proves that the public through its regulating bodies realizes the necessity of electric railway transportation, and is willing to compensate the railways for the cost of furnishing such transportation. The 5-cent fare habit has been definitely broken except in a few cases. According to the fare index, a record of which is kept by the association, the average rate of cash fare charged by electric railways in cities of more than 25,000 population, as of Sept. 1, 1924, was 7.44 cents. This was somewhat less than the highest point reached by the index of 7.46 cents in November, 1921, but the fact that fares tended downward after November, 1921, and then turned slightly upward again later shows that the charges for transportation are following costs as closely as is the case with electric light and power rates. This flexibility was conspicuously absent from the street railway situation before the war.

Third—The operating economies effected by the electric railway industry prove it to be an alive, progressive business, able and willing to apply brains to its transportation problems. Necessity is the mother of invention, and hard times have made electric railway people ingenious and resourceful. They have met the changing conditions with great adaptability. It is not so easy to show this in figures, but we find that the average cost of operation per car-mile has increased since 1914 about 85 per cent, and the cost of operation per passenger about 90 per cent, while the cost of labor has risen 121 per cent. This shows that the more frequent and comfortable service which we are furnishing today is being furnished with 6 per cent less labor per unit.

These favorable factors are not in my judgment a mere catching up with the handicaps which the war placed on electric railways, but represent a definite, tangible advance over the basic condition of the industry ten years ago.

Ten years ago the electric railways were (though many in the business did not then recognize it) ground between the upper and nether millstones of a fixed 5-cent fare on the upper side, and definite limits in operating methods on the lower side. In those days, any specific change in operating costs like a raise in hourly pay to trainmen or a boost in coal price was likely to mean a corresponding cut in net earnings due to the inflexible fare and stereotyped operation. When the war-produced prices came to jump basic costs, the first effect, before the relief of higher fares could be shown to be necessary, was devastating to electric railway net earnings.

Now, with the past 10 years behind it, the electric railway is a stronger investment than it was before, with a public need demonstrated, in the face of what was probably the most sudden and vigorous competition any public utility ever had to face and with a responsiveness of rates to costs now equal to any other form of public service.

I have gone into the above detail in discussing the financial stability of the electric railways because it is useless to discuss ways and means of obtaining customer or employee ownership until the question of what quality of securities we can offer is definitely disposed of. With this question favorably settled, however, it seems to me the electric railways are better situated than any other utility in the matter of presenting their securities to their customers and employees.

In the general experience of other utilities in local securities sales, the appeal to the individual, whether customer or employee, has been about as follows:

> The investment is a sound one because it serves a universal public need.
>
> It is a satisfactory one because you see the property at all times and patronize it yourself.

---

*Abstract of discussion on a paper presented at the annual convention of the American Electric Railway Association, Atlantic City, Oct. 6-10, 1924.

You keep your money at home.
Thrift is encouraged by the sale on partial payments.
The rate of return is satisfactory—as a rule much higher than obtainable from savings banks.
You help develop your city by helping to finance its utility service.
Employees find satisfaction in having their savings invested in the property for which they work.

From several years work on the subject and the observation of the work of others, I think it safe to say that all of the advertising and circularizing and sales talk in connection with local securities sales can be covered by one or more of the points above outlined.

On each of these points the electric railway is the equal of other forms of public utility service and in some it seems to me superior. It is superior in being constantly before the investor as the other utilities are not. It may require some imagination on the part of the customer to visualize the universality of the electric or gas service, but the street cars are always before him and he is much more conscious of their constant use by himself and others. For the same reason, the appeal through street car advertising to the prospective investor can be made when he is actually using the property.

A valuable additional interest in their jobs can be given to the trainmen by enlisting their help in distributing printed information on the cars to those who, as the advertisements suggest, "Ask the Conductor."

Again in raising money for extensions to the system these can be made much more real and tangible to the prospective investor than is the case with most electric or gas extensions for which new capital may be needed.

In general, my feeling is that the proved success of electric light and gas companies in selling securities to their customers and employees is a sure indication of what electric railways can accomplish along the same lines, and that taking the industry as a whole the financial aspects are such as to warrant the effort at local distribution of the railways' securities.

Financing of Street Railways*

Fairer Conditions for Electric Railways Would Reduce Cost of Capital and Be Beneficial to Company and Public Alike—Market for Traction Securities Getting Better

Allen G. Hoyt

STREET railway fares to be just and reasonable at the present day cannot be predicated upon conditions which obtained in the past. A very large proportion of the operating expenses of the electric railway consists of direct payments to labor. Wages of platform and other employees during the past decade or two have doubled or more. Taxes and the prices of materials and supplies have greatly increased. In the transportation business high wages cannot be offset to any material extent by the increased use of automatic machinery, by mass production or by increased efficiency of generating units. The industry does, of course, enjoy from time to time economical developments, such, for instance, as the use of the one-man car, and it also benefits from the tendency of the traffic to grow in density. But generally speaking, it cannot pay the wages of today which, where fairly comparative with those obtaining in other industries, should be maintained, and give good service unless the rates of fare are materially higher than those which were established years ago.

There is little doubt that if the street railway industry were permitted to operate under conditions which would thoroughly rehabilitate its credit, the public would receive adequate urban transportation service at lower cost than it can hope to enjoy under any other policy. Inadequate fares mean restricted service, inability to finance needed improvements or extensions and a situation unsatisfactory to the riding public and the investor alike.

While these facts are obvious enough to those who come in contact with the industry from either the operating or financial side, they have not been obvious to the public. The car rider has been led to believe that somehow and in some way he can have service without paying for it. He has been fed a lot of hokum about the traction interests, and, not understanding the nature of corporate finance, is very suspicious of all arguments showing the necessity for adequate rates of fare. He does not appreciate that if the credit of an industry is destroyed it is a slow and expensive process to revive it. The plight of the street railways during the past years will mean relatively high cost of capital for some time to come, a condition which will tend to increase the cost of service. The quicker the situation is remedied the greater will be the gain of the car rider.

PROGRESS BEING MADE

However, while progress has been slow, the effort to make the public realize the false economy of a niggardly policy toward the transportation agencies is making headway. Unremitting antagonism to the traction company is getting a little shopworn as a political formula. There seems to be a growing demand for a more constructive policy. A number of resettlement franchises have been or are being negotiated which recognize the necessity of allowing the railway to earn at least a moderate return upon the value of its property.

With a better understanding of the railways' side on the part of the public, there have been other favorable developments. Fares have generally been readjusted, and, while seldom entirely adequate, they are now more in line with present day costs. In most communities the menance of the jitney has been removed. The street railway, in many instances, has met the problem created by the entry of the motor bus into the passenger transportation field by adopting this agency for supplementary or co-ordinated service.

While, for a time, there seemed to be a tendency to question the essential character of the service rendered by the traction companies, it is now generally recognized that for handling surface passenger transportation in large communities there is no satisfactory substitute for the electric railway.

MARKET BETTER FOR TRACTION SECURITIES

The attention being devoted by railway management to the cultivation of public relations, not only through the medium of improved service but by various means of publicity, is having its effect in developing good will.

With the encouraging trend in the industry the market for traction securities has somewhat strengthened and it has been possible for bankers to underwrite a number of street railway bond issues. During the current year the volume of electric railway financing, while still very moderate, at least shows a material increase over that of former years. During 1923 the amount of strictly electric railway securities sold, according to records published in the *Commercial and Financial Chronicle*, approximated $28,000,000. During the first seven months of the present year the electric railway financing exceeded $69,000,000. The total public utility financing during this period amounted to more than $1,000,000,000, and, therefore, the financing by electric railways amounted to 7 per cent of the aggregate of public utility financing. This is not an imposing percentage, but it is at least an appreciable one.

While the recent flotations have indicated that interest in traction securities is reviving, the terms and conditions surrounding the offerings show that the prejudice on the part of the investor against electric railway obligations has not been entirely eliminated. The financing has been largely confined to the senior securities of important companies serving relatively large centers of population. The bonds were amply protected as to property values and the issuing companies enjoyed favorable records of earnings. Notwithstanding the apparently sound character of the securities, it was necessary, in order to find buyers, to offer them at prices yielding an exceptionally liberal return. It is inevitable that for some time to come the unfavorable experience of the past will be reflected in the prices at which even well secured traction company bonds can be marketed.

Customer and Employee Ownership*

Investors Should Purchase Railway Securities Because Electric Railways Are a Fundamental Necessity—Enthusiasm and Confidence Must Radiate from Electric Railway Men Themselves

By Fred Scheel
Vice-President Utility Securities Company
Chicago, Ill.

THIS is the first electric railway convention I have ever attended. Up to two years ago, when I had to make it my business to know something about electric railways, I looked upon the electric railway industry as a business that appeared to be step by step passing out of the picture. What I may have to say about electric railways has the advantage, or the disadvantage, of having the perspective of the man on the street.

I was more or less astonished this year with my study of how I might best sell electric railway securities to find that the electric railway is indispensable to growing communities. Nothing can take its place in mass transportation, but in many instances they have nowhere reached their maximum possibilities of usefulness. I have a feeling that those railways that are operated in conjunction with other utilities have had certain advantages in securing new money and, therefore, in keeping a more optimistic point of view toward the whole industry. This is quite natural for two reasons:

1. They have had more profit, better credit and consequently more money to work with.
2. They have had the encouragement of seeing other utilities make a decided turn in 1920 and 1921.

Yet in spite of these facts, how often have you seen the financial prospectus of a combination company setting forth in large type the facts in figures about the gas and electric business, and down at the bottom of the page hidden in small type you read, "This company also operates an electric railway between Oshkosh and Manhattan and local lines in the 'City of Despair.'" Other companies have gone further and have dropped the words "railway" or "transportation" from their titles.

Here is an industry with upward of $5,000,000,000 invested and it now needs more money.

What has all this to do with customer ownership you ask? Gentlemen, this is the heart of customer ownership. The enthusiasm, the confidence, the faith in this business must radiate from you. It cannot come from the outside. The story of what your industry has done in spite of all adversity, the real economic need of your business in modern life, and your plans for the future should be shouted from the housetops. It is not the job of a single convention or a single committee. The work requires the best thought and the full-hearted support of the entire industry. Much can be accomplished by directing facts at the men who shape financial opinion. I mean the local banker, the investment banker and the broker.

BANKERS STATE THEIR VIEWS ON TRACTION SECURITIES

Last week I attended the American Bankers' Convention in Chicago. I frankly asked not less than six bankers who do business in widely separated parts of the country what they thought of electric railway securities. Briefly, I summarize their replies.

Two of them modestly said they were not well enough informed to give a definite opinion. Two expressed the opinion that the situation had turned for the better and two said they would not buy electric railway securities with Russian rubles.

These are harsh words. If this is a fair cross-section of opinion throughout the country, consider what great good could be done by presenting the story of the electric railways interestingly to this group.

Other utilities have no monopoly on customer ownership. Customer ownership is essentially a public utility instrument of finance because public utilities are surrounded by certain safeguards not found in other industries. Are not electric railways public utilities? Why should they be separated from the others?

Other utilities did not start customer ownership through vision and foresight. Customer ownership resulted from: (1) Diminishing net returns; (2) high prices for money; (3) attractiveness of tax-exempt securities; (4) wider national distribution of income.

In 1920 most of the companies had very definitely reached the point where the banker required larger junior equities. The position of your industry today differs from that of other utilities only in the fact that you have organized the customer ownership movement. As a matter of fact you have the good fortune to be able to capitalize the experience of others by formulating the most satisfactory and productive plans to accomplish results.

I need not expatiate at this time on the advantages of customer ownership. Your interest is in the question: What actual steps should be instituted to start campaigns throughout the country? Individuals will stoutly maintain that some specific local condition makes it undesirable for them to go ahead. The picture of the cross-section of the electric railway business, however, makes it appear fair to say that customer ownership will work in any section.

AN EXAMPLE

It was my good fortune to be identified just a year ago with the sale of $1,500,000 of the prior lien stock of the Chicago, North Shore & Milwaukee Railroad. In this sale, all of the stock was sold to approximately 3,500 shareholders. Let me say that at the start of this sale the president of your association, Mr. Budd, who happens to be the president of that road, gave this matter of stock selling his very serious consideration. He made it the first order of business of that railroad and gave to the sale that inimitable punch which characterizes the things he does. I say this because you cannot expect to put this thing over for electric railways unless it has the attention of the very biggest executives on the property.

The follow-up of this sale was in the hands of C. E. Thompson, assistant to the president. Again in June this year we started the sale of $5,000,000 of prior preferred stock of the Chicago Rapid Transit Company. Mr. Budd again made this the first order of business, and in this instance his assistant, E. J. Blair, devoted his time to the follow-up of the sale. In spite of the fact that every one was willing and anxious to do all he could, no one could fail to note at the time of the start of the sale a feeling of misgiving among the people charged with this job. Since that sale we have as good a market in Chicago for that stock as we have for the securities of some of our well-known gas and electric companies. It may be of interest to note the progress of that sale by months:

May	8,227 shares
June	9,137 shares
July	7,213 shares
August	5,330 shares
September	4,351 shares
Total	34,248 shares

Out of this sale came the happy phrase "Passenger partnership," as more fitting for electric railways than customer ownership, and we offer it to you for your national use if you approve of it and see fit to adopt it. Aside from the very great good that comes in the way of better public relations as the result of passenger partnership sales, there is nothing which has given the employees a better appreciation and understanding of their business, in all its ramifications, than this sale of stocks to the public. In the judgment of B. J. Fallon, vice-president of the Chicago Rapid Transit Company, if nothing else were accomplished, that in itself would justify the expenditure of money that has been made.

---

*Abstract of discussion on a paper before the annual convention of the American Electric Railway Association, Atlantic City, N. J., Oct. 6-10, 1924.

COMMITTEE PROPOSED

Permit me to suggest that your organization establish a passenger partnership committee to:

1. Outline a definite policy and a standard of practice for member companies.
2. Support local traction sales, by the use of national mediums, selling the fundamentals of the industry.
3. Establish uniform practices in the manner of secondary markets.
4. Prepare and distribute to bankers and brokers interesting data, curves, charts and facts about business.
5. Collect and compile sales methods, advertising and campaign methods for all companies.
6. Assist wherever possible in launching new sales.
7. Establish a code of ethics as to securities sold and methods of advertising.

Electric railways will find from the experience of other utilities that it is wise:

1. To keep advertising conservative.
2. To avoid high pressure methods.
3. To sell only on an investment basis.
4. To remember you are talking to the small investor.
5. To remember the secondary market as your responsibility.

SMALL INVESTOR OF TODAY WILL BE LARGE INVESTOR OF TOMORROW

Electric railways today are institutions not only of transportation, but they will become through passenger partnership institutions for the investment of funds by people in all walks of life. Many railways will take on a new aspect in the eyes of their customers. It is not uncommon for a man selling preferred stock of a local railway to be consulted with reference to the value of securities, real estate, bonds, mortgages, etc. It is important that the information he gives be reliable and that his counsel be worth while, because in the last analysis the man who to-day is an embryonic investor, tomorrow is genuinely interested in corporate finance. He reads the financial page. He follows the security prices. His income grows and he becomes a bigger and more frequent investor. If you are going to keep him in line as a subscriber to the electric railway industry, it is necessary that he be served in an intelligent fashion.

In closing, I wish to point out that the success of "Passenger Partnership" depends upon the industry going to the general public confident of its own future.

*The Financing of Electric Railways**

By J. P. Harris
Vice-President Union Trust Company
Cleveland, Ohio

No Need to Worry Over the Future of the Electric Railway Industry—A Personal Experience in Rehabilitating an Interurban—The High Calling of the Railway Industry

J. P. Harris

I HOPE as a banker and from the standpoint of a banker, I may present some fundamentals to you tonight which may point to a solution of the problem in the electric transportation industry. As we all know, electric railway transportation has been in very low repute in the minds of the investing public, and I am going to cover as briefly as I can what to my mind appear to be the chief reasons for that condition.

You have got to restore public confidence in the electric railway and interurban before you are going to induce the private investor to put his money in electric railway securities. Optimistic as I am regarding the future of the electric railway in this country, I am going to take a positive stand that the electric railway finances are on a sound basis, and among the electric railway securities are now some of the best bargains in the investment market. I think I may speak with some experience in that regard as an officer of an institution with some $280,000,000 of deposits, representing nearly 250,000 separate depositors, with $40,000,000 invested in securities; a good portion of them in electric railway and interurban railway securities. I want to, if I may—if I can—convey to this audience here the feeling of assurance and optimism which I feel and we all feel at the Union Trust Company with respect to this great industry.

Among the obstacles, or rather among the reasons, which have perhaps contributed as much as anything to the ill repute among investors in which the street railway industry has been held in the last few years particularly is probably the bugaboo of municipal ownership. Now, I am not a bit worried about municipal ownership and operation of public utilities such as we have in our own town of Cleveland—in the municipal lighting plant which we all know now is a fraud upon the citizenship of Cleveland. We need only to point to Seattle, where we had the amusing and amazing spectacle this summer of the committee coming to the banks and asking the banks to take script issued for payment of street railway men's wages, and the banks to take their chances on the community levying taxes sufficient to make up the deficits—a city operation netting a deficit of about $4,000 a day. We need only to point to the experience which Detroit is now having, and we could go down the list in a multitude of cases to show that municipal ownership, which is equivalent to political ownership and political operation, is bound to be a failure and a burden upon the tax-bearing community.

I have absolutely no fear, with the intelligent citizenship of this country, that we have any grave danger to fear from confiscation through municipal ownership campaigns. I am not worried a bit, for instance, in New York City, and every time I think of New York City I think of the words of Cicero to Catiline, "How long, O Catiline, wilt thou abuse our patience?"

The Mayor of New York is standing as probably the greatest handicap in the development of New York City that can be found today. He is absolutely blocking the expansion of transportation facilities in that great center, but still I have absolutely no fear with respect to the securities of transportation companies in New York City which we hold in the Union Trust Company, and I have a half million of Interborough Rapid Transit bonds of 5s and 7s there. I am not concerned a bit about them. I am not concerned a bit about the municipal ownership campaign in Chicago. We have a large amount of Chicago securities. I know they are absolutely good and I know that they will ultimately be paid.

I am not concerned about any of these situations because I know that fundamentally public interest demands that public utilities shall be operated by private resources under public regulation, and I know that that principle is becoming more widespread throughout the entire country as we are gradually returning to days of sanity.

JITNEY MENACE DISAPPEARING

Another thing that probably has caused lack of confidence in the street railway industry as much as anything else has been so-called jitney competition. I am not a bit worried about jitney competition either, and I speak from a little experience in that regard, but before coming to that point I want to point out the general principles on which I base optimism in that particular respect.

---

*Abstract of a paper before the annual convention of the American Electric Railway Association, Atlantic City, N. J., Oct. 6-10, 1924.

If we are abreast of the time we must recognize that motor bus transportation is a mode of transportation which has come to stay. The street railway and interurban railway companies must recognize this addition to their facilities as probably a necessary auxiliary more and more in the future, to feed the existing lines of transportation operated by them. But the illegitimate and promiscuous competition of irresponsible operators, I believe, is a thing of the past or very rapidly is becoming so. We have already, as you know, in 25 states and also the District of Columbia laws regulating illegitimate competition of that nature, where the transportation companies already existing are giving satisfactory service, and it is a matter of public policy, becoming recognized more and more so through public utility commission decisions and supreme court decisions, that transportation is a natural monopoly to be regulated and protected from illegitimate competition and to be handled only by those who are expert in handling transportation.

That I believe is a fundamental issue which is becoming more and more widely recognized throughout the entire country.

A PERSONAL EXPERIENCE

All of this may sound like theory, but I am going to tell you now how it all has been suggested by one personal experience which I happened to go through: The bank with which I am connected, through some circumstances which it is not necessary now to detail, came into possession some years ago, along with two other institutions in Cleveland, of the entire issue of underlying first mortgage bonds on a certain interurban line serving two large cities and several smaller cities in one of the states of our Union. That line was a portion of the consolidated system on which there were other bonds, but we were early told by the representatives of the junior bonds and the consolidated system that they were glad to resign the equity they had in our portion of the system and give the property over to us to work out our own salvation. The property, as it was handed over to us as the underlying bond owners, represented a mileage of about 75 miles with no franchise in any city in which it operated. The equipment was 28 years old, practically obsolete. The right-of-way was very much worn down; there was no transmission line and no power house. Otherwise we had a fine property.

You may smile, but just stop and think a moment. That was the only property that could render service to those communities, and knowing that fact I was not at all disturbed as to the ultimate outcome of our venture. I knew those communities had to have transportation. I knew there was no other transportation system on the ground to give that service, and it was merely a matter of negotiation to amend all the defects I have just related.

The first position that I took with the mayors of these several communities was that this line was fundamental to the prosperity of those communities and that if we operated in them we would have to be welcomed with the same degrees of co-operation and support as any other industry in those communities. I was told in a typical way of the value of franchises, and how I ought to pay for them. My answer was that a franchise is not worth a nickel unless it contains terms whereby it may be operated with a profit. Unless I was welcomed with the same degree of cordiality that was extended to others, I would prefer to tear up the tracks and go out of business. I was threatened with city-owned buses, but I reminded them of Akron, Saginaw and Toledo and the futility of that threat.

Well, to make a long story short, we executed a new power contract. We built new transmission lines and bought a half million dollars' worth of new street cars, and today that road is being operated by its present owners on a basis to yield twice the interest on a $4,000,000 investment as against $1,546,000 which we had in the property, and we received back all of our interest and principal and interest on the interest, as well as our cost. In other words, there was a situation which I think I would have had difficulty selling to this audience. But I was absolutely sure from the beginning it was going to work out profitably and satisfactorily because of the fundamental reason that it was the only property capable of giving transportation facilities to those communities. I mention the case merely to suggest this fundamental principle of electric railway and interurban railway operation in this country. It is a natural monopoly and has to be protected as such. It is in the public interest. It should be protected and regulated under proper auspices. As long as we have the citizenship of our country leaning in that direction, I say again we can feel assured as to the future of this great industry, one of the greatest lying at the basis of our whole national prosperity.

I want to get this point across because you people have charge of one of the greatest fundamental industries in this country, and no business is sound which is not based upon sound morals and sound ethics. No financial structure can hope to survive which is not based on those foundations. In conclusion, I want to urge you and call you to a new sense of the dignity and high calling of your profession to the end that you will not submit to bludgeoning from unscrupulous officials or submit to unfair burdens in franchise, and that you will demand the recognition due your great industry, which lies at the base of our national prosperity.

Relation of Municipal Officers to the Utility[*]

By Hon. William A. Magee

Mayor of Pittsburgh

The Problems of the Municipal and Utility Officials Largely the Same — Both Have a Taxing Power and Both the Same Master — They Can Help Each Other by Co-operating

William A. Magee

I HAVE been asked to speak here this evening on the relations between the public utility officer and the municipal public officer, two kinds of officers that nearly all people believe have some sort of antagonistic relation. I have been both of these. I have represented public utility corporations as counsel, I have been and I now am a municipal officer, and I had the good luck one time to be invited to serve on the Public Service Commission of Pennsylvania. So I have had the good fortune to have a somewhat broader experience than most persons with the utility problem.

The public official looks upon himself as a public servant, one who is responsible to the public and must do directly or indirectly what the public wants him to do, and he looks upon the public utility corporation and the utility executive in the same light, i.e., as one who must do what the public tells him to do. He is perfectly right in that viewpoint, but he is not broad enough. He forgets that the owners of the utility company have put their capital into the public service. He either has forgotten or he does not know that the Supreme Court of the United States and of all of the states have said that to deny that capital a fair return on what is invested is the equivalent of confiscation of that property. Therefore, when a question of service or a question of rates arises, he thinks only of the duty of the company to the public, and he does not think of the reciprocal duty which the patron owes to the owner of the property.

---

[*] Abstract of a paper before the annual convention of the American Electric Railway Association, Atlantic City, N. J., Oct. 6-10, 1924.

Now, having said that about the municipal official, I must say something of a similar nature about the utility executive and the utility director and the investor in the utility securities. He is concerned primarily upon the return to his capital, but he is short-minded if he thinks that is the first, or the sole, consideration that should be in the minds of the management of that property. It isn't. It has been given franchises by the public authorities to perform a public service. The first thing it must do is to prove its right to earn this return, and that proof lies in the service that it renders.

I wonder whether the owners of utility securities have any idea that they are just as truly tax-masters of the people as the public officers are. They are indeed. The average American family pays far more to his local utilities for railway, gas, telephone and electric light service than he pays to the public treasury for all of its police service, its fire protection service, its street cleaning, its street lighting, its poor and health and all of its other public services.

REASONS FOR BOND OF INTEREST

There should be a great bond of sympathy instead of antagonism between municipal officials and utility officials, firstly, because, as I told you, they both levy the taxing power, and secondly, as I told you, they both have the same masters. But there is more than that to it. They have an identity of interest and identically the same problems. I don't mean now in the large way I mentioned as to educating their public; I mean that they have the same identical individual special problems.

Imagine a public official who gave the public all the police protection it wanted, as clean streets as it wanted and all the fire protection that the city needed, yet was denied an adequate tax rate. That is the same identical thing that you have. The public wants good, ample, frequent and comfortable service, yet sometimes is unwilling to pay an adequate fare. You must do what the municipal official has to do—explain to the public what your troubles are, show it that the same thing pertains to your business that pertains to its, and to the woman of the house that it pertains to her business—the maintaining of the household.

If you can make the people stop long enough to think that they are paying now almost twice as much as they were for all the necessities and luxuries of life, but are paying you only about 50 per cent more now than they were in 1913, and that when they are depriving you of a reasonable rate, they are denying themselves the service that they want from you, just as if they refuse an adequate tax rate. I believe they will understand your position more clearly.

Fortunately, the worst factors in the problem have already been removed. The unlimited and unconditional franchise has been nullified by the creation of the public service commissions which have authority to regulate these utility companies. In the last 25 years the courts have developed the doctrine of confiscation, namely, that a denial of fair rates is attacking of property and the constitution denies the taking of property without compensation.

Those are the two worst things in the whole business, and they are eliminated. The only other thing that I see is that this public, which is no longer hostile, is suspicious and not fully informed about the present status of the situation. The public must be more enlightened, and here is where the public officer can do a very great good. He stands between the utility company and the public, at least so far as concerns knowledge of the problem. The public officer does not know your problems as you know them, but he knows them vastly better than his public. He could undertake, if he would, a process of public education, which, however, he cannot do, and I presume would not do if he knew that he could not, unless the public utility companies themselves take the lead.

There are one or two things that I believe public utility companies might begin on. I think it would be to the interest of the utility company as well as the public (I don't know which one more; I say both of them) if these interminable proceedings before public service commissions could be shortened in some way.

Thus, having been on the public service commission, I have a vivid recollection of a great number of proceedings that lasted two or three years. I have seen the utility companies actually starve while their lawyers and the public lawyers were fighting out a rate case.

The other thing that I wanted to mention, and it is in the same nature, was something that we are trying in the city of Pittsburgh at this present time. The principal point in our contract is that we have provided a board on which there is representation both by the public and by the company. Every member of it is entitled to go into every department, into every book, into every record and to have access to every executive official of the railways company so that the public representatives on that board will know just as much about the affairs in detail of their company as the men know who are operating it.

My theory about this question is that the trouble between people is due to misunderstanding or, to put it another way, to lack of understanding, to ignorance. It is because the public has not known the facts about the Pittsburgh Railways that the railways company has had trouble with the people of the city of Pittsburgh. From now on there will not be that state of affairs. The city of Pittsburgh, through its representatives, will know everything, and those representatives will be able to advise the public whether or not this demand or that demand or the other can be met.

Muscle Shoals[*]

By Robert G. Gordon

Bruce, Bullit & Gordon, Louisville, Ky.

None of the Methods Now Under Consideration for the Disposal of This Undertaking Will Provide the Best Result—Congress Should Appoint a Commission to Negotiate

Robert G. Gordon

DURING the war it became of the utmost importance that facilities for the manufacture of nitrogen in this country should promptly be provided, because the government could not afford to rely for its supply of this commodity upon the ability or the caprice of any foreign country. After a thorough study, it was determined to construct nitrate plants near Muscle Shoals on the Tennessee River in the northern part of Alabama.

At that point, there existed an available site for the construction and operation of a large hydro-electric power plant. The site was owned by the Alabama Power Company, having been acquired by it several years prior to that date at a cost in excess of $500,000. The government undertook to negotiate the purchase of the site, but its representatives and those of the company were unable to agree. Rather than accede to the terms offered and being unwilling to impede the war activities, the company donated the property to the government, and making a deed therefore in consideration of the sum of $1, which was actually paid.

The government immediately began the construction of the "Wilson Dam." Some months after the termination of the war Congress declined to make further appropriations. At that time the dam was about 30 per cent completed and approximately $17,000,000 had been expended thereon. In the meantime, the government had completed the construction of two nitrate plants, which cost, including an adjacent limestone quarry, approximately $80,000,000.

At the beginning of its construction work upon these projects the government, under a contract with the Alabama Power Company, and at a cost of about $5,000,000, installed electric generating equipment of 40,000 hp.

---

[*] Abstract of a paper presented before the annual convention of the American Electric Railway Association, Atlantic City, N. J., Oct. 6-10, 1924.

capacity at the Black Warrior steam station, about 90 miles south of Muscle Shoals, with a transmission line between those points. This power was used for the purposes of construction work at the dam and at the nitrate plants. Recently, in accordance with the terms of the contract with the power company, the government sold that equipment to the company at a figure slightly less than $3,500,000.

Within the last two years Congress has authorized the completion of the Wilson Dam and power plant. Work has been resumed with a present force of more than 5,000 laborers, and it is anticipated that the project will be completed during the year 1925. The capacity of the plant will be 600,000 hp., of which, however, only approximately 100,000 hp. will be what is known as primary power. The cost of completing this plant is estimated at $25,000,000 over and above the $17,000,000 expended by the government before work was discontinued.

Situated 14.7 miles up the Tennessee River from the Wilson Dam is another site for a dam and plant, with a capacity of 250,000 hp. This is known as "Dam No. 3." The estimated cost of that project is $25,000,000, exclusive of the cost of the necessary lands and flowage rights. The effect of the dam at that point will be to render the Tennessee River navigable for a distance of 65 miles above the dam.

Prior to the discontinuance of the work in 1920, the government had actually expended a little more than $100,000,000 on the whole undertaking. In 1921 it became apparent that unless the Wilson Dam should be completed, and the nitrate plants either actually operated or maintained in operating condition, all the money theretofore expended would soon be dissipated in disintegration and waste. The government made it known that it desired to work out some satisfactory arrangement with private capital for handling the situation. A number of offers were received, including one which was made by Henry Ford and which has been the subject of bitter controversy both in and out of Congress.

In its final form this offer was equivalent to offering $1,500,000 for the two nitrate plants and the quarry. The Ordnance Department of the army estimated that the salvage value of that property as junk was at least $8,000,000, but that it could probably be sold at more than $12,000,000.

Among the principal objections to the Ford offer are these: The price offered for the purchase of the physical properties is ridiculously inadequate. Mr. Ford expects to use for his own manufacturing purposes any electrical energy generated. In that event, he will be in a position to manufacture any commodity which he may choose at far less than any competitor because he will have an $80,000,000 investment in manufacturing plants and houses and equipment which will have cost him $1,500,000.

This great natural resource should be developed for the residents of that section of the country. The full value of the hydro-electric development at Muscle Shoals cannot be obtained except by connecting those plants into a super-power system, for the reason that such a large proportion of the capacity of these plants consists of secondary rather than primary power. This can probably not be accomplished through Mr. Ford.

In March of this year the House of Representatives by a decided majority passed the bill authorizing and approving the Ford contract. The matter is now before the Senate, and the Senate committee has reported that bill unfavorably, recommending as a substitute a bill providing for government ownership and operation of the dams and electric plants through a government corporation and authorizing the operation of the nitrate plants by the government through the Secretary of Agriculture.

Offers of other private interests which appear to be more favorable to the government than the Ford offer have apparently been discarded, and, as the matter now stands in Congress, the issue is whether the Ford offer shall be accepted or whether we shall have government ownership and operation of these facilities.

Thus far, the matter has been handled by taking bids. That is not the method by which business people consummate big transactions. If the Muscle Shoals projects were owned by a private corporation desirous of disposing of them, it would not advertise for bidders nor undertake to reach an agreement by correspondence. Its executive officers would hold personal conferences with the parties interested in the purchase or lease, at which all details of the proposed transaction would be the subject of full discussion. In order for the government to secure the most advantageous terms, it must conduct its negotiations in a similar manner. This can be accomplished by the appointment by Congress of a commission, whose duties would be similar to those of the executive officers of the private corporation.

Co-ordination of Railway and Bus Urged by Manufacturer[*]

By *A. J. Brosseau*

Secretary and Director
National Automobile Chamber of Commerce
President Mack Trucks, Inc.

Alfred J. Brosseau

Place for Both Types of Vehicles—With Proper Co-operation the Transportation Company, the Rider and the Public Will Benefit — One Organization Should Furnish All Forms of Mass Transportation

I DO not pretend to know anything about the electric railway business. It is not my intention to propose anything new, or to find fault with the old, but rather to review the situation from the viewpoint of an industrialist who has had some experience in analyzing business problems, and to ascertain to what extent the new element—the bus—may be used to advantage in your business.

I am told that several years ago one of the partners of Stone & Webster, in an address to his organization, said he wanted them to quit thinking they were in the street car business. He told them they were in the transportation business.

That is in accord with my idea of the street car business—that it is really engaged in manufacturing and selling a commodity called transportation.

If so, your problems are comparable to those with which other industrialists have to reckon.

If you agree with me that we are fellow manufacturers, with similar problems, it will not be necessary for me to try to "sell" the bus to you.

The public has accepted the bus. Your job, and mine, is to find its proper place in the transportation business.

If the electric railway operators do not grasp the opportunity to furnish a co-ordinated trolley and bus service, others will furnish the bus service.

The day is past when electric railway companies can buy a bus or two and expect the public to believe that its demand for a more mobile and comfortable type of service has been satisfied. The merchant who displays attractive goods in his shop window must carry them in stock for sale.

I believe one organization should furnish all forms of mass transportation—whether subway, trolleys, or buses. The time has come when existing transportation systems must be rounded out to meet the demands of the public for efficient and satisfactory facilities. "The public be served" is a sound business policy which has stood the test and applies equally to all merchandising operations—whether in transportation or other commodities. The situation which confronts the electric railway operators of today is not a new one. When the horse car was introduced 90 years ago it was not welcome and there were many objections to its use.

---

[*] Abstract of a paper before the annual convention of the American Electric Railway Association, Atlantic City, N. J., Oct. 6-10, 1924.

The transition from horse to cable and cable to electric railways was not accomplished without argument.

Dire prophecies of bankruptcy have invariably been made whenever a change has been proposed. I have a history of the street car industry prepared by Henry W. Blake, the veteran editor of the ELECTRIC RAILWAY JOURNAL, that is most interesting. I have, also, a book of clippings from the publications of your industry.

From the beginning you have had "die hards"—those who view with alarm any change, whether of method or of practice. And yet changes and improvements have been made.

Until now the changes have been confined to different forms or types of equipment operating on rails.

The most revolutionary change you have ever made is now going on. I refer to the motor bus. I believe it will do more to stabilize the industry and earn the good will of the public than anything else you have ever done.

I do not believe the growing popularity of the bus justifies the prediction that it will displace the trolley. Neither do I believe that as the bus comes more and more into use it will take away so much of the revenue of the electric trolley cars as to bankrupt the traction companies and make their securities worthless.

There is a place for both types of vehicles and if they are properly co-ordinated the result will be to the advantage of the transportation company, the rider, and the public. Perhaps the following analysis of the traction situation will illustrate the advantages of co-ordinating the trolley and the bus.

It is quite generally known that the cost or valuation of existing trolley lines is often four, and sometimes five, times the amount of annual gross revenue. No one will deny that the capital invested in traction companies is entitled to a fair return. If the capital invested is four times as much as the annual gross income, and 6 per cent (surely little enough) is a fair return, we find that 24 per cent of annual gross income must be set aside to pay interest and dividends on invested capital. Out of the remainder must be paid taxes, which I am informed average 7 per cent of annual gross income—depreciation and maintenance and operating costs.

If this is the condition of existing lines, it is obvious that the traction companies cannot extend their tracks into new territory, or engage in expensive reconstruction of tracks in thin traffic territory.

The cost of the extensions would be prohibitive and result in a loss to the traction companies because the patrons cannot be expected to pay sufficiently high fares to cover interest on investment, taxes and operating costs. Even though the traction companies did extend their tracks into newly developed and thin traffic territories, the lines would be far apart, and the service so infrequent as to cause dissatisfaction. And again, it has often happened that the trend of development has been away from trolley lines. What seemed a promising territory has turned out to be unprofitable. The trolley is there and cannot move. Such conditions as I have mentioned obtain to some extent, I believe, in nearly every city in this country.

If I am right in thinking that you are transportation merchants, you will solve your problems as any other industrialist. How is it done?

The wise merchant finds out what sort of merchandise his customers want. He then provides plant, machinery and equipment to produce the product at the lowest possible cost. He does not attempt to force the sale of goods his customers do not want.

This is what has been done by the traction companies who have taken the bus into their system of transportation. They are meeting with a wide public appreciation which is reflected either in added income or lowered costs. Those who have used the bus as a defensive measure are finding that the public is demanding broader policies.

I have spoken of extensions in thin traffic territories—but the bus has a place in densely populated, congested territories. I have given the subject much thought; have conducted many studies, and have very definite ideas on the subject.

BUSES HELP IN PROVIDENCE

Perhaps my ideas may not appeal to you now, but if there is any merit in my belief that we are fellow manufacturers and merchants, some day my theories will be given consideration. In the meantime I will quote from what we laymen consider an authority on trolley transportation to illustrate the place of the bus in co-ordinated transportation—namely, the ELECTRIC RAILWAY JOURNAL, March 15, 1924, page 411.

> By the unusual expedient of inaugurating bus service parallel to and on the same street with its regular car service, the United Electric Railways, Providence, R. I., has increased its net income and gained much public good will. For several years there was a persistent demand from the residents of suburban communities, particularly in the district beyond Olneyville, for more rapid transportation. At that time the company was operating both local service in the city and through service to outlying communities via Broadway. The complaint was that the many stops made to care for short-haul passengers was a source of serious delay to the through passengers. Complaint was made also that on an inbound car the local passengers had no chance whatever of securing seats, because they were all occupied by the through passengers boarding at points beyond Olneyville before the car reached the city limits.
>
> One way that was suggested to remedy this was to build passing tracks alongside the existing double tracks to permit the operation of express cars which could then get ahead of the locals. It was felt by the company, however, that such a solution of the problem would involve considerable expense and would present serious operating difficulties. Instead of installing passing tracks, therefore, the railway decided to carry the local passengers by bus and operate all electric cars express to Olneyville Square.
>
> A combination of two favorable circumstances made it possible to do this successfully. In the first place, the width of the street was sufficient to permit bus operation alongside the track without interfering in any way with the rail operation. In the second place, there is only one heavy traffic street crossing Broadway, so that the express cars can operate reasonably close to their scheduled speed and are not frequently delayed by traffic at intersections. The result has been to reduce the running time between the center of Providence and Olneyville Square, about 1⅜ miles, from 15 minutes to 10 minutes, and also to provide vehicles which have empty seats available for the short riders.
>
> Bus operation was commenced in May, 1923, and the number of motor buses in service has been augmented from time to time as the traffic has increased.
>
> The former headway with street cars alone was never as short as the present 2½-minute schedule and was somewhat irregular, because the cars of the several through lines and the short line cars did not divide the intervals evenly. There are 7,013 scheduled seats on the buses both ways each day, and the number of passengers averages 5,500. The outbound bus terminal is about 1,000 ft. short of Olneyville Square, to prevent the crowding of the local buses by passengers to whom the express service is available. The latter people take the cars from Olneyville Square to Providence rather than walk the 1,000 ft. to the bus terminal and the entire bus-carrying capacity is therefore available for the short-haul riders. The express cars run between Olneyville Square and Exchange Place, stopping inbound for passengers to alight, but not to board, and outbound to pick up, but not to discharge.
>
> In the morning the first inbound trip of the buses starts at 5:40 and the last trip at night leaves the center of the city at 1 a.m. The railway express service is operated during the same hours. Between 5:40 a.m. and 11:40 p.m. there is a starter at the inbound terminal. Two men, each working a 9-hour shift, regulate the bus service. They are solely bus men, however, and have no responsibility whatever for railway operation.
>
> The bus stations are closely spaced, averaging only about 300 ft. apart. They are marked by twin yellow bands on the trolley poles, in contrast to the ordinary white band used to designate a car stop. In spite of the frequent stops, however, the buses' average speed for the section along Broadway is slightly over 10 m.p.h. Cars average about 16 m.p.h. through this territory. The company feels that it is undesirable to operate buses at too high a speed, and hence no attempt has been made to shorten their running time. As a result, 995,848 persons were carried by buses on this route during 224 days of 1923 without injury to a single passenger. The bus-miles per accident have been nearly double the average car-miles per accident.
>
> A 6-cent fare is charged on the buses. Nine metal tickets are sold for 50 cents, the same as on the cars. Payment is made by inserting the ticket in a Rooke register, or when cash fares are paid a nickel is inserted and a penny handed to the operator. Each operator must turn in as many pennies as there are nickels rung up on his register. Transfers good on car lines other than those operating on the same street are issued by the bus for 2 cents.
>
> Financially, bus operation has been very satisfactory. The withdrawal of local cars from Broadway saves the railway considerable money. Against this economy the cost of bus operation to supply the local service is less than similar rail operation would be. As a matter of fact, more passengers are now being carried by the cars alone. . . .

Speaking as an industrialist who has enjoyed the opportunity of analyzing many business problems, I would say that the United Electric Railways qualifies as an able manufacturer and salesman of the commodity called transportation.

There is still another field for the bus. I am told there are individual lines of many trolley companies that are unprofitable and promise to continue to be unprofitable. Such a situation existed at Everett, Wash. In order to avoid a paving expense on certain lines of approximately $400,000 the owners of the franchise elected to abandon the trolley and install buses. I understand the public is well served and satisfied and the bus operation profitable to the owners of the transportation company.

Another instance of the tendency on the part of far-sighted operators to reduce capital expenditure follows:

In Allston, Mass., the Boston Elevated Railway replaced one of its single-track car lines with bus service because the city was about to repave the street, which would require a heavy expenditure for paving by the railway company. It replaced a car line in Malden with buses in order to avoid laying new tracks, the cost of which traffic did not justify. It later replaced its Highland Avenue car line in the same city in conformity with its announced policy to replace non-paying rail lines with motor bus service whenever the plans of the city authorities require reconstruction of streets and tracks.

So far I have confined myself to what a layman would call street car territory—transportation within cities and towns.

There is another field in which the bus, while not in every instance competitive to the trolley, may well be considered—if we are to cover the subject in a comprehensive manner.

I refer to the so-called interurban zone. It is in that field that the bus has had its greatest development. The reasons are obvious and need not be gone into in any great detail. It is only necessary to mention less capital requirements, flexibility, and the fact that it gives the rider the equivalent to individual motor car transportation as nearly as can be done.

One of the most successful operations of this sort, from the standpoint of co-ordination of bus and trolley, is that of the Pennsylvania-Ohio Electric Company, Youngstown.

I understand the buses were put on, originally, as a defensive measure, to eliminate independent competition, but proved so satisfactory that they have been continued, and the operation extended.

The ELECTRIC RAILWAY JOURNAL, Sept. 13, 1924, gives a very comprehensive description of this operation from which I quote:

"Before bus operation was attempted, conditions on the interurban lines were bad" and "figures indicate that the interurban bus operation as conducted by the Pennsylvania-Ohio Electric Company is successful and satisfactory from the standpoint of operating income."

The answer, as I see it, in all such situations is the bus. It can be installed at a fraction of the cost of the trolley. It is flexible. It is not tied to a track. It can cruise over a thinly settled territory, and can accommodate itself to a peak load demand. *And it's what the rider wants.*

Perhaps some of you will deny this. If so, I shall not argue the question except to say that, quite generally, when the traction companies refuse to operate buses—where adequate trolley facilities do not exist, or as a supplementary service—buses are operated by independent operators and often at higher rates of fare than that charged by trolley companies.

I have found it difficult to obtain accurate detailed information as to capital expenditures and operating costs of trolley companies, but the information I possess convinces me that neither the cost of installation nor the operating costs can possibly justify opposition to the bus.

If the installation of buses in place of trolleys in thin traffic territory will cut down capital expenditure and reduce cost of operation, if there is any merit in the Providence and Youngstown operations, if trolleys can be abandoned, as in Everett, Wash., and if the buses offer a more satisfactory form of transportation—what stands in the way of the widespread use of the bus by the electric railways?

Are the dangers they see real, or just partly or wholly imaginary? Is it the fear that the use of the bus will depreciate the value of the property which is pledged to the owners of the bonds and the stockholders?

THE BUS PROTECTS THE RAILWAY

Some electric operators, and others, seem to think so. Again, others insist that the electric trolley car is the only vehicle that should be used to transport passengers on our streets and highways. It is my firm conviction that the bus, if given its proper place, will protect and safeguard, rather than destroy, the security back of the bonds and stock outstanding. Instead of imposing burdens on the riders and the public, it will benefit them to the extent that it reduces the amount of capital required to provide adequate and satisfactory transportation facilities. If the bus is accepted wholeheartedly by the electric railways and properly co-ordinated with the trolleys it will serve the public to a greater extent than will obtain under competitive conditions.

Let us analyze the problem item by item:

If the traction companies—

Adopt the policy of laying no more rails in new and thin traffic territory and use the bus in all such operations, in place of the trolley, and when the cost of repairs and replacements is prohibitive, and as supplemental to the trolleys, in order to reduce congestion and to give the public a more satisfactory form of transportation—what will happen?

Equipment. As the trolley cars wear out or must be repaired at a considerable expense, they can be discarded and replaced by the bus—those remaining used for mass transportation in congested districts where electric railway operators insist the trolley is more economical than the bus.

Power. No street car company will change its method of transportation overnight. As the demand for current to operate street cars decreases, a market can be found for power and light at a profit as great as or greater than is obtained on the current used in street car operation.

Franchises. As to franchises, I am sure that any student of public utility operations will agree with me that the *value* of a franchise is not based entirely on physical assets, but rather upon the good will or earning power of the business, and as to traction companies, this means the opportunity to secure the monopoly of all forms of transportation.

Good will does not exist, if the company does not provide the service the public wants. Unless that service is given, I say to you, in all frankness, that no investor acquainted with the facts will buy bonds or stocks whose value is predicated upon the value of the franchise. The traction company may retain the franchise, but it will not keep out competition.

If these arguments do not dispose of the objections to the adoption of the bus, what are the reasons that have caused many of you to hesitate to go into the business of selling transportation, instead of selling only street car service? Perhaps the answer is contained in a report by one of your own committees which had asked several companies why they had gone into the bus business.

Some of the reasons are significant—"compelled by prohibitive cost of new paving"—"confronted with serious competition from buses"—"demand of public authorities."

It seems to me this is another way of saying "We were forced" because public utility commissions, backed by public opinion, are granting franchises for bus operations—whether to the traction companies, or to independent operators.

The fact that these steps have been taken in defense seems to indicate that your industry is aware of the growing public demand for buses.

Will you meet it, or will you let it overtake you?

Why not profit by the experience of the companies who *have* met it?

The experience of the Public Service Corporation of New Jersey illustrates what I have in mind.

Because of conditions and circumstances which made it difficult, if not impossible, for that corporation to install buses at the time the demand developed, jitney cars, makeshift buses, and finally, high-grade modern buses, were installed in large numbers by independent operators.

Many of these buses paralleled the trolleys, others established routes on streets where trolleys did not run and extended their service into territories beyond railheads.

The bus service, while not wholly competitive, nevertheless, materially reduced the income of the trolleys.

When the management finally realized that there was a widespread demand for buses it very wisely decided to give the public such transportation as it wanted—trolleys, buses, or both.

The change in policy has in large part regained the good will of the public, and I am convinced will bring in greater financial returns to the corporation and better service to its patrons.

While not disposed to criticise trolley companies for not sooner adopting the bus, the fact remains that their refusal to do so has resulted in a large loss of income—and much ill-will on the part of the public.

If the trolley companies who have not already adopted the bus will do so at once, they will get into the business at far less expense than will be incurred if they wait too long.

It is my privilege to know Thomas N. McCarter, president Public Service Corporation of New Jersey, and while I may not know him as well as some of you, I want to say that in my humble opinion the policy adopted by his corporation, and by many others as well, will (if accepted by the industry generally) put mass transportation, both urban and interurban, on a sound financial basis.

Such a policy will create good will and confidence on the part of the public. It will protect the capital invested in the business. It will insure a fair return on the capital invested in the business. And it will bring about co-operation between the utility and its patrons.

Do not think because I am laying stress on the public demand for a more complete transportation system that I see the motor bus taking the place of the electric trolley car. Four years ago George M. Graham, and again last year Alfred Reeves, of the National Automobile Chamber of Commerce, explained our position to you better than I can now. It is enough to say that what I have in mind is the use of *each* form of transportation in its place and in the way which best suits the public's convenience and necessity.

There may be routes where buses should be ruled out entirely and the field left to the electric trolley. There are others, such as the Providence and Youngstown operations, where bus and trolley may operate on the same street; the bus taking care of the local traffic, the trolley operating as an express, or vice versa. There may be other routes where, at a higher rate of fare, the bus will offer de luxe service, with comfortable seats for all riders, on a fast schedule. In still other instances the bus may act as a feeder to the electric lines, in territory beyond railheads where cost of extensions would be prohibitive.

I believe that the bus should be regulated as any other public utility. I do not think it should be relieved of taxation because it is a new agency. All agencies of transportation should contribute to the cost of government, as in California, where buses are taxed on their gross earnings as the railroads and trolleys are taxed.

I do not ask for special favors for the bus. It will rise or fall on its own merits and not because of special privilege. It should be granted no better and no worse treatment than is accorded to other forms of transportation.

I believe many of you in the electric railway industry will agree with me that the above are sound principles.

I know many master salesmen in your industry.

These men are giving the public not one but several kinds of transportation service. By so doing they are creating good will for their companies.

They are protecting their bondholders and their stockholders. They are converting frozen into liquid assets, and mobilizing their resources to meet changing conditions.

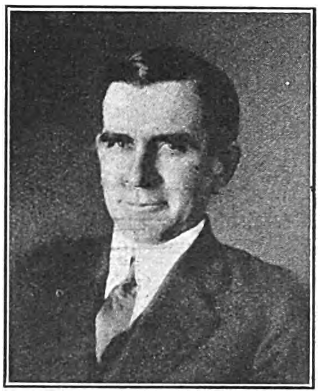
They are splendid business men and good citizens. Their success points the way!

I tender the wholehearted support and co-operation of our industry to help solve the problem of "Co-ordination of Motor Vehicle and Electric Service by Electric Railway Companies"—the subject assigned to me.

*Co-ordination of Other Forms of Transportation with the Electric Railway**

By Paul Shoup

President Pacific Electric Railway,
San Francisco, Cal.



Paul Shoup

Essential Utilities Must Be Protected from Destructive Competition—Railway Is Indispensable—Eventually Buses Will Have to Carry Same Obligations as Traction Companies—Duplication of Service Impairs Efficiency and Results in Higher Fares

THE very fair and able presentation of Mr. Brosseau on this subject of the co-ordination of other forms of transportation with the electric railway leaves a great deal less to be said than perhaps under different circumstances would have been deemed necessary by an electric railway man.

Certainly the principle enunciated by Mr. Brosseau to the effect that there should be a co-ordination in ownership and management of both the electric railway and motor bus operation in any given territory where they might otherwise come in conflict or in competition, and that each should find its own sphere according to its need as developed by the public demand or the public use (which is sometimes a very different thing from the public demand) is something that we all must accept.

There is nothing in the electric railway situation that justifies us in presuming that we have any God-given right to exist unless we justify that existence by performing necessary public service. If it should be in the cards that through the advancement of science and art the electric railways are to be superseded by some other form of transportation, then they must go, just as the ancient horse car had to yield to the electric railway.

However, there is, I may suggest, nothing in this situation at the present time to indicate that the electric railway is to be superseded by some other form of transportation. Indeed, it seems to me that to get a clear understanding of this situation we must deal with certain principles or certain statements of fact, as I see them, in discussing a problem of this kind.

I want to put forth this view—that if the electric railways are essential to the public of the United States, essential as their chief transportation agency outside of steam railroads, then they must be protected, if any competition or destructive agency tries to destroy that public service, even though the public may itself not have everything else desired in the way of service.

To get at this subject directly, I am going to state certain propositions which I believe to be fundamentally sound. These are:

1. The electric railway is not to be superseded as a public utility by any other form of transportation. It is not only useful; it is indispensable. The development of the motor vehicle has not resulted in providing a carrier that in any way takes the place of the interurban or street car. The question, then, is one of co-ordination and not of supersession.

2. Where a very considerable part of the public transportation service is being given by electric railways, it is desirable almost to the point of necessity that if motor bus service be introduced into that same section, the services of the two should be co-ordinated in the fullest degree under one ownership and one management.

3. In determining the share of the traffic each is to take care of, that is the motor bus and the electric railway, now and hereafter, whether under one management or operated independently, it is necessary to consider the two forms of transportation under like conditions, for eventually the motor buses will have to carry as great a share of public obligations as do the railways.

4. The necessity for co-ordination in the public interest is, indeed, very great and it is the duty of the electric railway industry to emphasize this fact in every section of the country; wastefulness of the competition now existing between the electric railways and the motor buses is not only unfair in itself to the electric railways, but is imposing a heavy burden on the public.

All those engaged in transportation business are agents of the public. We derive our rights from the public through charters and franchises. We are devoting private capital to a public service, and it is just as much our duty to do everything that we can to make that service economical and efficient in the interests of the public as it is our business to protect the private capital invsted in that service.

I should like to repeat my first statement: "The electric railway is not to be superseded as a public utility by any other form of transportation. It is not only useful; it is indispensable. The development of the motor vehicle has not resulted in providing a carrier that takes the place of the interurban or street car. The question, then, is one of co-ordination and not of supersession."

---

*Abstract of a paper presented before the annual convention of the American Electric Railway Association, Atlantic City, N. J., Oct. 6-10, 1924.

I think you all know that, and yet the figures which have been presented are worthy of presentation again. I have been particularly impressed by Mr. Murphy's statement as to the operations of the electric railway companies of this country in 1923, when, as he put it, we carried more passengers, earned greater gross revenues, operated more passenger car-miles than ever before in any one year in the history of this industry.

It is true that certain added burdens in the way of operating expenses came upon us. Increases in taxation, for one thing, made our net revenue somewhat less than we had had in some previous years, yet as an agency for the public service the electric railway companies of the United States were in greater demand, were more essential to the welfare of this country in 1923 than in any previous year in the history of this country.

Now the fact that we carried, according to Mr. Murphy's figures, some 36,400,000 passengers per day on the 400 principal electric railway lines of this country, allowing for other companies about 44,000,000 passengers per day—illustrates the magnitude of the obligation that electric railways of this country have assumed and are carrying on successfully.

These 44,000,000 people represent about the working population of the United States. The majority of these passengers probably are carried in the two hours in the morning and the two hours in the afternoon. Certainly a very large proportion of them are. No one can imagine any form of vehicle other than the electric car that would perform this service. Why, it would take at least 15,000,000 automobiles, assuming that street surface would permit, to carry these people morning and evening to and from their work. I am, therefore, in entire agreement with my friend, Mr. Brosseau, that the electric railway is not to be superseded.

Now when a thing is as essential to the public welfare as this electric railway service, it is obviously entitled to public protection. That brings us to this second point that I would deal with, and that is that where a very considerable part of the public transportation service is being given by electric railways, it is desirable almost to the point of necessity that if motor bus service be introduced in the same section, the service of the two should be co-ordinated in the fullest degree under one ownership and management.

Unfortunately that has not been the case, and it is because of the necessity of this co-ordination that both Mr. Brosseau and I are addressing you on this subject today. We find a very unsystematic competitive and destructive condition throughout the United States, one that requires co-ordination, one that requires regulation, just as Mr. Brosseau has said, so that both the electric railways and the motor bus companies shall be subject to like consideration from the viewpoint of the public.

It is true that the electric railways in 1923 demonstrated in greater degree than ever before their necessity to the public in the service rendered. Yet it is also true that in many sections of the country, through the unbridled competition of the motor buses, they have been hampered in that public service, hampered because out of their somewhat narrow net revenues the motor buses have been able to take a considerable part of that dollar that is left after paying operating expenses, taxes and some necessary interest, to the end that the electric railways have not been able to command the necessary credit to extend their operations, build new lines, even if such lines were justified, to acquire additional equipment and to meet the many obligations of a public nature that are being constantly put upon them.

Out on the Pacific Coast we have had a good deal of experience in that direction. We are fortunate in California in having a courageous and experienced State Railroad Commission with adequate powers, but even that commission is being subjected at all times to a tremendous pressure by motor bus operators to parallel these necessary lines of electric railway transportation.

It is very natural of course that the motor bus operator should seek to parallel these lines. The electric railway development is not so far in the past but what nearly everybody recognizes the fact that those communities that are served thereby have been in large degree created by this electric railway service, and today for the value of the homes and for the value of the industries along these lines are dependent upon that service.

Naturally with this population along these lines a motor bus operator does not seek to pioneer (we can put ourselves in his place), but prefers to go along that line and take the established business. It is true, as Mr. Brosseau has said, that in some instances the population has developed away from these electric lines, but in the territories with which I am most familiar on the Pacific Coast, this is true in only a very, very limited way.

The electric railways have been the pioneers—whether street car companies or interurban companies—and the development of population of homes and industries has been along those lines. And so we have the situation confronting us throughout the United States of the paralleling of a necessary and essential service to the public by motor bus lines. This should not have occurred, and should not be permitted in the unregulated and unbridled way in which at this time it is being permitted in many states.

In the State of Oregon, for example, the number of passengers carried by the electric railways has dropped since 1919 from some 83,000,000 down to 72,000,000, notwithstanding the increase in the number of city fares collected. We find that the lack of regulation is responsible for a great number of what we might call itinerant motor buses, many of them without any financial responsibility, in taking from the interurban lines the necessary support to continue their existence. As a matter of fact, the principal interurban line running south out of Portland today is having a very hard struggle to live, notwithstanding its steam railroad backing. It is a well-known fact up in that country that there is a very considerable discussion as to whether or not its abandonment will not be necessary in the next twelve months.

We (the Southern Pacific Company) operate some electric lines out of Portland, and they do not meet their operating expenses and taxes. Yet there would be a very great public outcry if we attempted to abandon them.

In Oregon, as I have said, there is no regulation. The Public Service Commission there has no power. As a matter of fact, one of the railway companies, grown desperate over the situation of competition with its railroad down to Astoria, has established a motor bus service of its own to compete with a motor service competing with its steam lines. The result is that we have three forms of transportation when one would do. Certainly that is a cutthroat situation that ought to be eliminated by some systematic regulation and some form of co-operation.

And Oregon, after all, is only an example of what is going on elsewhere. There isn't a much better situation in Indiana, where there has been a falling off in the number of passengers carried by the interurban railways, a very large falling off according to the figures furnished me by the Indiana commission. Indeed, comparing 1920 with 1923, notwithstanding the growth in the city business, there has been a decrease in the total number of passengers carried in Indiana from 273,000,000 down to 263,000,000.

The Public Service Commission of Illinois directs my attention to the statement that in Illinois from 1920 to 1923 there has been a decrease in the number of interurban passengers carried from 75,000,000 to 62,000,000, though the number of fares in the state has increased from 1,118,000,000 up to 1,219,000,000, due to the increase in the city traffic. In Ohio you have no better situation.

We find throughout the country that this unregulated competition with the electric lines by motor bus companies is very seriously interfering with the public service. And along with this regulation that must come there should of course be the co-ordination as set forth by Mr. Brosseau.

In southern California the Pacific Electric Railway, with which I am associated, has had a very considerable experience in the matter of what we might term unregulated motor bus competition, for the reason that these various motor bus lines were established before the State Railroad Commission had jurisdiction. We keep close track of our losses from this competition. We don't try to determine these losses from the viewpoint of the business carried by the motor bus companies, but only by a careful estimate as to the cost of the service we give, and the extent that that service is not availed of by the traveling public because the motor bus takes passengers away from us.

That meant about $1,300,000 loss in gross revenue to the Pacific Electric in the last 12 months. If those services were co-ordinated this business would be carried almost entirely on the electric lines, and the motor buses would be used where they would take the passengers not otherwise cared for. That would mean that allowing $800,000 net out of the $1,300,000 (because after all the Pacific Electric would not be called upon to increase its facilities, except in a very limited way, and it would not have to add a great many cars to its service) we would be able to make an investment on a 6 per cent basis of some $12,000,000 or $13,000,000 to help take our tracks off the streets, and build terminals in the city of Los Angeles. We operate almost entirely on private rights-of-way outside the city. Perhaps we would be able to furnish more buses in some sections that needed them, and in every way we would be able to give a more efficient and economical public service.

Steam Railroad Experience Similar

You may be interested in a similar careful estimate with respect to the Southern Pacific Company, its lines in western Oregon, south of Portland, and west of El Paso, Tex., where we furnish service which would be availed of and which would meet the situation if there were no motor buses, and where our losses amount to about $4,000,000 per annum. A very large part of this is net, and you can capitalize the amount that would be saved if we had a co-ordinated service, and which could be devoted either to reduction of fares or, what is more essential out in that territory, to an increase of facilities. If $3,000,000 of that would mean added net revenue, and capitalized on a 5 per cent basis, because steam railroads so far have a better credit than the electric lines, we would have perhaps some $60,000,000 that could be put into facilities devoted to useful public service. That country out there with its great growth needs all of the railway capital that it can get.

Illustrations of this kind exist pretty well all over this country and indicate conclusively the need for this co-ordination, if the public is to have its necessary railway service maintained and developed according to the growing need. If we had this co-ordination we would then have removed that fear on the part of the public as to the safety of its investments. Transportation companies would be able not only to command capital but would be able to command that capital at a lower rate of interest.

Let me repeat my third statement. "In determining the share of the traffic each is to take care of that is the motor bus and the electric railway, now and hereafter, it is necessary to consider the two forms of transportation under like conditions, for eventually the motor buses will have to carry as great a share of public obligations as now do the electric railways." I think Mr. Brosseau substantially made that same statement, and that all that the motor bus can expect is fair treatment.

The electric railways, repeating something that is known to you all, have to pay taxes on their properties. They usually have to pay 2 per cent or more of their gross income in connection with the franchises they have secured. They have to pave the streets between the tracks and 2 ft. outside, sometimes for the use of their neighbors, the motor buses. They have to pay costs of grade separations; sometimes have to light the streets. They are involved in a great many expenses and contributions, and some so-called investments that don't bring any revenue to them.

The motor buses must expect (and I am speaking now from the viewpoint of an operator of motor buses) to have their burdens increased. Out in our state there is a tendency on the part of the public to look upon the motor bus as something that should rent its roadbed, that is, the public highways, as long as it does not have to create and pay for that highway as the railway companies have to do. Nearly all of the interurban railways in our state are on private rights-of-way and of course the street car companies do have to pay for the right-of-way, the roadbed occupied in the streets.

The Private Right-of-Way May Come

We find another difficulty out there. The operators of the private automobile, and the ownership of private automobiles is increasing all the time, look upon the motor bus as something of an interloper. They feel that the highway was created for citizens generally and not for common carrier purposes. It becomes more and more difficult to maintain schedules, and the greater the obligation the motor bus operator feels to maintain these schedules, the greater public resentment he creates among the owners of the private machines. It may be that in time private rights-of-way will have to be created, and will be found purchased by the motor bus operators. This would be especially true if any attempt were made to hand over to the motor bus for transportation any very large part of the traffic now carried by the steam and electric railways.

Further, there is no financial problem greater in importance with the states at this time than that of creating and taking care, of their public highways. Tremendous use of these highways involves the necessity of building very much more permanent and much more expensive highways than heretofore and this same use makes the maintenance of the highways far more expensive. The result is that these states are seeking all the time for new sources of taxation to take care of this tremendous burden, and they look upon the motor bus as one of the coming sources—I was going to say "something more to be plucked," but it seemed hardly fair. Nevertheless, if anyone goes out and examines the magnificent exhibit of motor buses at this electric railway convention, he must realize that a tax collector, if he should happen to stray into that hall, would feel that there was wealth unparalleled. I had to explain that to one of my friends last night. He said, "Where are the electric railway cars at this convention and why all these motor buses?" The best explanation I could make was this: That all the electric railway cars were in use.

Finally, I should like to repeat "that the necessity for co-ordination in the public interest is very great indeed and it is the duty of the electric railway industry to emphasize this fact in every section of the country, that the wastefulness of the competition now existing between the electric railways and the motor buses is not only unfair in itself to the electric railways but is imposing a serious burden upon the public."

Bus Operation Not Profitable

This subject I have already discussed quite extensively. Obviously anything that threatens in any considerable degree the transportation of 44,000,000 people per day is something of very great interest to the American public, and in our position as agents for the American public in carrying on this transportation we ought to do all that we can to show the necessity for coordination and for regulation to keep this essential service of the electric railways from being in any considerable degree destroyed.

We are trying out this matter of coordination in southern California. Perhaps we have been a little slow about it, but after all I am not so sure as to that, judging from the results. The Pacific Electric Railway is perhaps one of the largest interurban, yes, and city bus operators in the United States. We have 160 buses in operation at this time. We have over $1,000,000 invested in them. Most of these have been put in service in the last twelve months. We expect to increase that number. In some other sections of California and Oregon we are putting buses into operation. I don't mean the Pacific Electric, but other companies with which I am associated. The Los Angeles Electric Railway in southern California, operating some lines jointly with us and some independently, has, I believe, now over 80 buses in service. These two companies therefore have about 250 buses in operation in and around Los Angeles. We are getting some first-hand experience. We are trying to do just what Mr. Brosseau suggested; that is to say, to supplement the service of the electric railways with the automobile business, to take care of those sections of the community that have been built up away from the electric lines, and where construction of electric lines under the present conditions, with the tremendous expense of street paving, heavier rail and so on, is not justified.

Well, we are getting a good deal of experience. It is costing the Pacific Electric now about $20,000 a month; that is to say, we are falling short to that extent in getting a 6 per cent return upon the investment, depreciation and operating expenses. We are hopeful (we are still in the pioneer stage) that expense will be materially reduced in time to come.

In any event we are willing to take on this obligation; in fact, the people of Los Angeles by a very decisive vote decided that the Los Angeles Railway and ourselves should take on the obligation, rather than have Mr. McAdoo come in and help us out in carrying on transportation in that city. We are trying to fulfill that obligation. It may be that we will not realize anything net out of it, but I would just say, by way of caution in that connection, that it is very easy to over-extend the use of a motor bus in the way of supplementary service. It would be very easy indeed for the Pacific Electric to multiply this loss of $20,000 per month many times over.

RAILWAYS ARE ENTITLED TO PROTECTION

We are giving an essential service down there, and our point of view is that we are not called upon under threat of having that service paralleled by some motor bus line to go into a territory with an extension of motor bus service where eventually that motor bus service will not pay its way, or at least justify itself in connection with the operations of the electric railway. Certainly the electric railways are entitled to protection where they are giving an essential public service, and no threat of what will be done to their paying revenue lines should induce anybody to put on a motor bus line, or for that matter, any other kind of transportation, in some outlying section that they do not feel directly or indirectly is justified. If a situation of that kind comes about, then we ought to take our case to the public and point out the nature of the threat and what is attempted in the way of destroying this essential service to the public, because of the desires of a comparatively small number of people or perhaps of real estate owners to secure a service that is not justified.

I haven't said anything much about the motor trucks, but the same arguments that apply to the motor bus apply likewise to the motor trucks. In fact, where the electric railways have been giving a freight service they have probably been more seriously interfered with by this itinerant and unregulated motor truck service than they have by motor buses in passenger service, proportionately speaking.

TRUCK COMPETITION HELPFUL

It is very hard indeed to regulate the motor truck service in California; we find that there are a great many motor trucks operating as public utilities that are not responsive to the law, evading it in every way they can, and with their door-to-door deliveries they have caused a very serious loss of revenue to the steam and electric railway companies. Of course, you appreciate that these losses, even though they be not very large relatively in dollars and cents, come out of our net revenues to such an extent as seriously to affect them. This motor truck competition must also be co-ordinated, must also be systematized and regulated and be obliged to carry the same burdens that we carry in connection with our freight traffic on the electric railways.

In closing permit me to suggest this. We find from examination of the reports of the motor bus and motor truck companies to the State Railroad Commission of California that they are not as a whole making much money. One of the largest ones (I think it is the largest one) is just about breaking even and giving no return upon its investment. We find, on the other hand, that the electric railways are not making what you would call any exorbitant profits and we find that the steam railroads aren't having the easiest and best time in the world.

It does seem therefore from an economic viewpoint, from the public viewpoint, from the viewpoint of the owners of all of these properties, that the sooner we get systematically and carefully at this problem of co-ordination, to the end that we may all receive some return upon our capital invested and still give an efficient and economical public service, the better off all of us will be.

*Electric Railways from the Realtor's Standpoint**

By L. F. Eppich

Past-President
National Association of Real Estate Boards

L. F. Eppich

Established Rail Transportation Is the Surest Means to Secure Real Estate Development — Buses May Serve Until Such Time as Traffic Growth and Ability to Finance Warrants Construction of Rail Line

IN ORDER to get the realtor's view on the subject of electric railway transportation I wrote to a number of them in various parts of the country. To the question, "If you had a choice of the form of transportation, which would you consider would add most to the real estate values of your subdivision, street car extension or bus line?" the reply came emphatically, "street car extension," except in one case, and from the press of that city I learned that the first two of a small fleet of buses had just arrived, so the reply was probably based on expectation rather than performance. The reasons for the preference for street car extensions were: (1) Assurance of permanency to the residents—bus lines may be easily diverted or abandoned and the value of property substantially reduced; (2) regularity of service throughout the year. We are all familiar with the difficulties borne by the electric railways in keeping traffic open during winter storms. Such determination is not to be expected from motor bus owners.

REAL ESTATE VALUES DEPEND UPON STABLE TRANSPORTATION

To the question, "What would be the effect on, or shift in, real estate values if electric railways were eliminated and bus lines substituted," the consensus of opinion was that such a change would have a very detrimental effect on values because in large cities the bus is not suitable for mass transportation. The value of business centers is dependent on the presence of large numbers of people, and if they cannot be transported conveniently business is bound to suffer and real estate values decline.

And to the third question, "Should motor bus transportation be operated with, or supplement the electric railway system, or should it operate in competition," the opinion is that there should be one responsible organization and that the electric street railway is best qualified to perform that service.

ELECTRIC RAILWAY ESSENTIAL

Bus line extensions with transfer privileges are vitally necessary to the appropriate development of a city where it is not possible, nor advisable, to extend the car line. This deduction is reasonable because it gives the electric railway the opportunity of supplying the requirements as needed. When the population justifies the construction, and capital can be secured for it, the permanent extensions will follow.

Therefore, the electric street railway is the modern transportation agency most essential to the real estate man. We are unable to spend the time traveling from homes to business areas that old methods used to consume. Quick and adequate time-saving service is the demand of the day. Safety must come first, but speed and assurance of delivery follow closely behind. The trackless vehicle does not procure these three qualities so assuredly as does the rail car. But where the rail cannot reach, the rail-less motor will take the field and flourish while it meets the need for service.

I believe that the hostility of former years toward public service institutions is giving away to a realization that the interest of these utilities and the community are interdependent. Because it is a public utility is no reason why it should furnish service at, or below, cost. The war taught us all to analyze our investments more accurately. If the electric railway could be saddled with a large proportion of the cost of paving and other items which will readily occur to you, it was considered good municipal business. The fact that such charges at the present high prices must be included in operating costs reacted upon the unthinking citizen with accelerated force when he was asked to pay an increased car fare.

---

*Abstract of a paper before the annual convention of the American Electric Railway Association, Atlantic City, N. J., Oct. 6-10, 1924.

The growing realization of interdependence is suggested by another evidence of the willingness of the community to bear a share of the cost of construction of new lines. The city of Detroit is an outstanding example. In the election held last month the voters by a substantial majority assessed themselves for 68 per cent of the cost of a rapid transit system, 51 per cent to be assessed to adjoining property for benefits accruing and 17 per cent to the city at large.

COSTS OF EXTENSIONS ASSURED

The state of New York, in 1909, officially recognized this principle of assessing property owners for the cost of street railway construction, but it has not been put into practice. The property owners on Sixth Avenue are agitating the removal of the elevated road and the construction of a subway, they to bear the cost upon the assumption that the property will increase in value with commensurate rental returns.

In the past an occasional owner of a new subdivision indicated a willingness to stand a portion of the cost of a street car extension. These examples serve to indicate a growing disposition on the part of communities and individuals to assist in construction costs, and this principle will meet with general acceptance when it becomes universally recognized.

That real estate is enhanced in value by reason of transportation facilities is too evident to require more than a passing statement. The report of the investigation of the City Club, New York, in connection with the increase of property values adjacent to the subway from 135th Street to 230th Street in Manhattan, shows that the increase due to the new extension was 104 per cent. This was the percentage of increase allowed even after deducting the normal increase of values had no extension of the transit lines been contemplated. In the case of Detroit, pending the adoption of the charter amendment, no routes were selected at least partially, for the reason that it would cause a speculation in real estate in the affected districts.

VALUES BOOSTED BY TRANSIT PROSPECTS

In new subdivisions, it is generally conceded that land values increase from 100 per cent to 300 per cent as soon as transportation facilities are provided, and there is the added advantage that the owner finds a market for his property which might otherwise remain dormant, or at best take on only a normal increase in value.

These conclusions therefore definitely indicate the justness of the principle that those who profit by reason of street car extensions should bear a part of the cost. I believe that the future will witness an increasing co-operation between communities and public service corporations. Their interests are identical in many respects and contined effort to bring about this result will lead to a closer and happier relation for all.

John N. Shannahan, the New President

IN THE public utility field John N. Shannahan, the new president of the American Electric Railway Association, has done about everything there is to be done. He has been confronted at one time or another with practically every problem that ordinarily comes to the public utility operator and has scaled the ladder of responsibility from engineering assistant to public utility president. Most important, however, he is keenly alive to the sense of service which his position as the head of a public utility demands. Hs is gracious almost to a fault and is possessed of a deep charity, which has been put to some hard tests. Not only is he a very capable executive, but he has the happy faculty of getting along well with others. Strange as it may seem these attributes are not always concomitant.

IN SOUTHERN CITY SINCE 1912

As was explained in the Convention Daily edition of the ELECTRIC RAILWAY JOURNAL, Mr. Shannahan down at Hampton, in 1912 took over a lot of junk masquerading under the name of a public utility. It was public all right, much too public, but it was hardly a utility at that time. That it is both of these things now is due largely to Mr. Shannahan. He is an owner-manager. Moreover, as president of Peck, Shannahan & Cherry he is head of an operating organization responsible for the management of five public utility properties, all in the East, of which four are railways, suburban or interurban in character.

As its name implies the property in Virginia of which he is the head combines railway lines, electric light and power and gas. To them all, Mr. Shannahan has applied his skill and has worked out a winning combination—winning for him and for the residents of the communities his company serves. If there were any market for the securities of the companies which Mr. Shannahan and his associates took over in 1912 it didn't amount to much. The story is different today. Not only is there a market for them, but the record of that market has been spread before the public from time to time as small lots of the common stock have come into the market. The preferred stock has from the very beginning been on an investment basis.

WITH MANAGEMENT FIRM FOR SOME TIME

The territory down in Virginia has not been one that has grown fast. It is true that there was an influx and a bloom growth at the time of the war, particularly at Newport News, but any possible benefits therefrom to the Newport News & Hampton Railway, Gas & Electric Company were more than offset by the problems which the war-time period imposed. All these Mr. Shannahan surmounted successfully.

Before Mr. Shannahan became connected with the Newport News properties he was railway manager of the operating department of J. G. White & Company, Inc., New York, doing the multifarious jobs that a man working for a company controlling a large number of widely separated properties is called upon to do. He went hither and yon, applying all the knowledge that he had previously gained, learning many things and absorbing about all he saw that was worth while. And on the J. G. White properties, as they are constituted, Mr. Shannahan had a good chance to listen and learn. This he did.

Before that, from 1907 to 1911, he was vice-president and general manager of the Washington, Baltimore & Annapolis Electric Railway, the high-speed line connecting the cities named in the title of the company.

For three years before his connection with the W. B. & A. interurban, Mr. Shannahan was president of the Adirondack Lakes Traction Company in New York State, and from 1899 to 1903 was with the Edison Electric Light & Power Company and the Fonda, Johnstown & Gloversville Railroad, both controlled by the same interests, which he served first as chief engineer and later as general superintendent and general manager. The Fonda, Johnstown & Gloversville Railroad, by the way, is part steam and part electric. He entered the service of these companies in 1899.

A CIVIL ENGINEER BY PROFESSION

After his graduation as a civil engineer from Rensselaer Polytechnic Institute in 1894, Mr. Shannahan was connected with the Watervliet Arsenal for a short time, but his real business career dates from the time that he entered the employ of the signal department of the New York Central & Hudson River Railroad. In 1895, Mr. Shannahan was made inspector of signals on the Western division of that railroad. So the picture is fairly complete of the career of Mr. Shannahan from the time of his graduation from college. He was born in Troy, N. Y. in 1872.

Mr. Shannahan's association activities have been no less complete and diverse than his general business career. The record of his work in this connection is extensive. He was president of the New York State Railway Association in 1906-07 and has rendered valuable service to the American Electric Railway Association at all times, notably as president of the Transportation and Traffic Association in 1911-12, as a member of the executive committee of the American Association and as a vice-president of that body since 1920.

P.A.'s and Storekeepers Have Session

Good Will and Co-ordination of Effort Stressed—Backing of Management and Operating Departments Needed to Effect Real Economies—Purchasing Agent Should Be Fair in Dealings with Salesmen

MEETING for the second year as a separate organization, the purchases and stores committee of the Engineering Association held its meeting Tuesday afternoon, Oct. 7, in the Marlborough-Blenheim Hotel. The discussion pertained to the value of the stores department to the railway property. Co-operation of various departments, particularly the engineering department with the stores department, was stressed in several of the papers and the subsequent discussions.

President H. A. Johnson of the Engineering Association welcomed the delegates and expressed the confidence which the Engineering Association has in the committee's work as a separate unit. He reviewed the reasons and benefits to be derived by a separate organization, but invited and urged the members to attend the meetings of the parent association. That he felt sure the executive committee of the A.E.R.A. would approve the action of the purchases and stores committee in co-ordinating with similar committees of other public utilities was the closing remark of Mr. Johnson.

The question of a co-ordinated committee composed of members of the purchases and stores committees of the National Electric Light Association, the American Gas Association and A.E.R.A. was formerly presented in the committee's report as read by Chairman Jackson P. Dick.

Purchases and Stores

There were three subjects assigned, including review of existing standards. On Subject No. 1, which was classification and sale of scrap materials to increase the revenue therefrom, the classification prepared by the committee was recommended for adoption as a recommended practice and the committee concluded that the subject does not warrant further study.

Subject No. 2 covered a study of the proper place for the purchasing and stores department in a company's organization. The committee recommended that the stores department should be under the supervision of a general storekeeper responsible for the custody, care and distribution of all materials and supplies not actually in use, and that the stores department and the purchasing department should report to the same executive officer. It concluded that the subject does not warrant further study.

No changes were recommended in any of the existing standards.

It was requested that the committee be allowed representation on a committee composed of purchasing agents and storekeepers of the National Electric Light Association, the American Gas Association and the American Electric Railway Association in order that questions of mutual interest to the purchasing and stores departments of the three associations may be studied.

It was further recommended that an afternoon session be regularly included on the calendar of the Engineering Association for a meeting of purchasing agents and storekeepers at all future conventions and that the personnel be increased to 15 members.

The report was signed by W. C. Bell, J. F. Fleming, C. A. Harris, H. Lloyd, A. A. Ordway, W. S. Stackpole, W. H. Staub, C. Thorburn, A. C. Kennedy, R. H. Dalgleish, sponsor; N. Ford, vice-chairman, and J. P. Dick, chairman.

After commending discussion by several members, the report was accepted with the recommendation that it be submitted to the Engineering Association at its regular meeting Thursday, October 9.

How good will for the company could be built up through the purchasing department was explained by W. H. Sawyer, president East St. Louis & Suburban Railway, East St. Louis, Ill. Mr. Sawyer's address appears elsewhere.

Following this serious address, E. F. Wickwire, Ohio Brass Company, added ginger to Mr. Sawyer's pep by reading a pertinent paper on how the "pencil sharpeners" could be a help to the A.E.R.A. publicity committee. Delivered in true Wickwire style, seasoned with many appropriate stories, the talk drove home the desirability of "friendlyizing" the public. As the presence of a salesman in the purchasing agent's office indicated the manufacturer's interest in the company, the purchasing agent should endeavor to sell good will to the salesman.

Co-ordination between the purchasing agent and the operating department from the engineer's standpoint was urged by L. C. Datz, in the next paper. The purchasing department, no longer a necessary evil, should be represented in all departmental meetings. By proper co-operation with other departments each would appreciate the value of the other. When the purchase entails technical description, the engineer should deal directly with representatives of the manufacturer. However, the purchasing agent should be the one to close the deal. Mr. Datz ended his remarks with a plea for standardization in purchasing.

That the purchasing agent may maintain good feeling throughout the organization, was the gist of Harry M. Lloyd's address. Mr. Lloyd's paper appears in abstract elsewhere.

Perfect harmony between stores and other departments, with the purchasing agent as the dutiful servant of all departments, was urged by C. A. Harris, chief of stores Philadelphia Company. An abstract of this paper appears elsewhere.

Harry M. Lloyd and C. A. Harris were suggested for the offices of chairman and vice-chairman for the coming year. These selections were later approved by the Engineering Association.

◆

Importance of a Well-Regulated Supply Department*

By C. A. Harris
Chief of Stores
Pittsburgh Railways, Pittsburgh, Pa.

C. A. Harris

ONE of the outstanding facts which impresses itself on my mind continuously is the principle that the stores department when properly functioning is a perfect servant of the operating and executive departments. After all, however, the economic importance of a supply department can only be measured in the manner in which other departments use it.

I am reminded of an old story culled from Æsop's Fables in which he describes the vicissitudes of a miller and his son and a jackass on the way home from market. Both the miller and his son rode the ass separately and then together, yet could not escape the criticism of people whom they met. Finally, after tying the ass's legs together and hoisting it on a pole carried between them, they came to a bridge over a river, where the ass, frightened by the noise and his unusual situation, kicked and struggled until he fell into the river and was drowned.

---

*Abstract of a paper before Purchasing Agents and Storekeepers' meeting at the annual convention of American Electric Railway Engineering Association, Atlantic City, N. J., Oct. 6-10, 1924.

Far be it from me to suggest a close comparison between a jackass and the stores department, although I have heard it called worse names. Yet I do believe there is some basis for considering their situations analogous. The supply department does carry a burden, and while it may at times be refractory and kick, it can by proper treatment be made to go on steadily and smoothly performing the work that is expected of it, but it cannot please every one.

Of the various barometers which show the success or failure of the supply department, the material turnover, taking all angles into consideration, is an important criterion. In studying the turnover of different companies there are two classes of material to be considered: First, regular maintenance material; second, construction material or special equipment and supplies which are not necessarily standard. This second group usually is more than half of the entire investment in unapplied materials.

The storekeeper usually knows the requirements of his property on maintenance material and can gage the requisitioning. But when it comes to construction or special material he is merely an agent of the department asking for that material and is responsible only for its receiving, storing and issuing.

At one of our committee meetings a gentleman representing an electric light company in New York State addressed us and mentioned among other things an evident tendency on the part of operating officials to exclude the purchasing agent and storekeeper from deliberations at staff meetings, treating them both as more or less a necessary evil. It may be the fact that on some systems the supply departments do not get the recognition that is due them and it seems that in a good many cases they are working in the dark. I do not want this construed as a plea to tie a clean bib around these fellows' necks and let them sit in at the big table, but I want to bring home the fact that the storekeeper should be considered as having sufficient brains to use the information so gleaned for the more intelligent management of his own department to the best interest of his company. He should sit in at staff meetings or gatherings where operating questions are discussed; in other words, do not let him be an outsider. For even if a storekeeper were a wizard with uncanny knowledge, he is not a specialist or an engineer and cannot serve his company in the very best way without being in touch with current operating decisions.

The stores department cannot dictate how much money should be spent for materials and supplies, but it should control the requisitioning of ordinary standard maintenance material. While technically the storekeeper is responsible for all materials purchased, he has absolutely no control over the requisitioning of half the material which goes into his stock.

How then can this be remedied? By co-ordination between the stores and the engineering departments. When plans are made by the latter, they seldom take cognizance of the material on hand and order whatever they think is necessary for the completion of a job.

Should the storekeeper take it upon himself to make substitution? Should he correspond voluminously about each item that he thinks might be eliminated by substitution or to conform with what he has on hand? He is not technically fitted to do so, and I believe that it would be a great step toward economy through retrenching purchases, if an engineer were assigned to the stores department. If provision were made for such a specialist in the stores department, fully in touch with existing standards and designs, a good many purchase requisitions for construction would be unnecessary.

Usually the storekeeper is the last one to know if a design has been changed or abandoned. At the time such change is decided upon large amounts of material are sometimes on hand or on order. If he had a live engineer constantly with him I believe half of the material scrapped through obsolescence could be used up. I do not advocate holding back on modernization just because present equipment is still going. But most roads are confronted with disposing of repair parts for equipment which become obsolete because the storekeeper was not informed of a change, and, acting on his past consumption records, replenished his stock.

By cutting down the number of forms required in connection with the requisitioning and handling of materials, a saving of many thousands of dollars can frequently be made. But that saving is only incidental to the time saved the operating departments which have to fill out these forms. In other words, a great step toward economy can be made by the elimination of red tape.

This brings me to another subject which vitally concerns economy, and that is standardization. Bearing in mind the rapidly changing designs, there are some things commonly known as standard material, which do not change frequently. I believe it is just as necessary for utility companies to have a standardization committee as it is to have an operating committee and I believe that the storekeeper should be present at such meetings.

In many ways, therefore, technical assistance and moral backing by the managements and operating departments can be made to raise the supply department to a higher efficiency and to a level whereby real economies may be effected.

Purchasing Agent Should Have Dignity and Fairness*

Good Will May Be Spread by the Purchasing Agent in Dealings with Salesmen—Manufacturer Is Interested in Railway Not for Selfish Reasons

By W. H. Sawyer
President East St. Louis & Suburban Railway
East St. Louis, Ill.

WHEN I first started as a purchasing agent for a large holding company, I was inclined, as are practically all young purchasing agents, to believe that the purchasing agent's duty was to get the very most possible for his company. I had a tendency to believe that I was magnanimous because at times I did not buy based on price only but took into account quality; in other words, I rather prided myself upon securing for the company the most possible for the money paid. I say I had that tendency. I will not admit that even back in those days I believed in that doctrine. I know that toward the latter part of my years as purchasing agent I came to a full realization of the fact that it was essential and necessary from a good business standpoint so to treat the manufacturer or salesman that he believed beyond question that he had received from me a fair and a square deal regardless as to whether he received the order or not. I am, of course, referring back many years to a time when it was not the recognized policy of all purchasing agents to feel that it was their first duty to play fair and square with every man with whom they dealt. I do not believe there is a purchasing agent here today who does not recognize beyond question that this is the first essential of a successful purchasing agent, but you may not all fully appreciate just how essential it is that we so conduct ourselves. It is, of course, the duty of every employee of every public utility so to conduct himself that there can be no insinuation but what the company's intention and policy are to treat everyone fairly and squarely. I do not believe that the executive has any more important duty than so to conduct himself that the public will have confidence in him and in his company. There is nothing so important from an executive standpoint, to my mind, as the public relations problem. The executive cannot alone secure public confidence. The executive backed up by only a major portion of his organization cannot secure public confidence. We must have the support of every man in that organization.

There are two classes of men who

---

*Abstract of a paper before Purchasing Agents and Storekeepers' meeting at the annual convention of the Engineering Association, Atlantic City, N. J., Oct. 6-10, 1924.

if they do not believe in us, can and may do the most harm. One class is the employee himself, who, if he does not believe in us, does us the most harm of all because the public cannot believe in a company if it is told by employees that the company is not doing right. The employee is assumed to be prejudiced in favor of the company, and if he is not in favor of the company the public will naturally think that there must be something wrong with the company itself.

Now, the other men that are in position to do inestimable harm are the manufacturers and salesmen who deal with us, who sell us goods. If they in talking with their neighbors confidentially, as it were, make the statement that the company is not doing right, that statement is accepted, because the manufacturer is in a position where he should be prejudiced in our favor. The manufacturers and salesmen know whether a company is doing right. They really know better than the employees themselves, and far better than the public. The manufacturer and the salesman get their closest view of the company through its purchasing agent, through the man with whom they come in contact. Never let a manufacturer or salesman go out of your office with the impression that your company is not doing right.

There is something in purchasing other than mere bargaining, other than mere horse trading, other than mere "jewing" a man down to the point where he takes the least profit that he can eke by with. That is not purchasing, that is harmful business. The manufacturer and the salesman must live.

They are just as honest as you and I and sometimes more so. We must all so conduct ourselves that the manufacturer and salesman are for us, not from a selfish standpoint alone, not simply from the standpoint that they must be for us in order that they can sell their goods, but we must so conduct ourselves that the manufacturer or salesman are for us because they believe in us, because they believe we are trying to do right, because they believe that we are entitled to a full measure of support from them. Now the manufacturer and salesman are human. It is their business to know and understand men. You cannot often fool them. They may let you think you are fooling them, but understand, when you are dealing with these men you are dealing with men whose business it is to know and study and understand you, your company and its wants and position.

I have spoken primarily of the manufacturer and the salesman, not because the manufacturer and the salesman are not strong allies of our electric railway company, but because they are. The manufacturer and the salesman of electric railway material and apparatus are doing just as much today for the electric railway industry as are the bankers and the operators. They have the railway's interest just as much at heart. I have spoken of them because they are the men with whom you come mostly in contact; they are in a position to do the most harm if you cannot sell yourself and your company to them.

I admit that, try as you will, a salesman will sometimes leave your office feeling sore, but he should never leave your office without a feeling of respect for you and your company. Therefore, when we come to the question of discussing what a purchasing agent can do in building up the good will of the company I say that he can do everything toward building up good will, and I say further that there are few, if any, men in the company that can do more toward wrecking good will than a purchasing agent. He is admittedly in a position that requires delicate handling, a position where it is impossible for him really to satisfy all men. That makes his duty doubly hard.

A purchasing agent also does more than purchase. He talks, he gossips, he is human. He tells people what he understands his company stands for. He tells people what the desires and ambitions of his company are. He keeps before his acquaintances the facts in regard to his company, or he should do that.

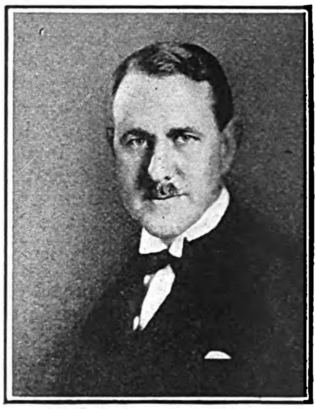
First of all, a purchasing agent must be fair to every man. If perchance he has to take action which does not appear to be fair he should tell this salesman what the facts in the case are. I do not believe in purchasing agents or any one else giving excuses when there are real reasons which can and should be given. If you buy your goods from one manufacturer due to the fact that he has helped you and co-operated with you and has been of real service to you, I believe that the thing to do is to tell the man who lost the order why the order was given to some one else. I do not believe in making a practice of lying to the man and giving him some phony excuse instead of a reason.

No purchasing agent can, of course, expect to promote good will if he is going to buy on a cold-blooded price basis. No purchasing agent can secure the most for his company if he is going to take advantage of a salesman whenever he gets an opportunity. In order that he does his full duty to his company the purchasing agent must at all times keep in mind that he (the purchasing agent) is the salesman for his company. He must keep in mind that he is a salesman selling service and good will; that he is a salesman selling the very name and future of his company. Purchasing agents are known to be analytical. Purchasing agents cannot, or at least should not, jump at conclusions. Therefore, statements made by a purchasing agent are not taken lightly as would be statements of some uneducated men or men who may be considered of a temperamental nature.

Co-operation from the Purchasing Agent's Standpoint[*]

By Harry H. Lloyd

Purchasing Agent Indianapolis Street Railway and Terre Haute, Indianapolis & Eastern Traction Company



Harry H. Lloyd

WE HAVE all heard and read much of the wonderful results of efficiency and co-operation and probably many have had expert advice on the subject. You have to experience co-operation to explain its good points and benefits. The chef who prepares the dinner may tell you all the ingredients, but the man who eats it can better tell you how good it is. Diversified temperament and make-up of different people makes it possible to cover the subject of co-operation from the purchasing agent's standpoint by one terse statement—*"Use diplomacy."*

Meetings of all department heads called periodically by an executive officer are beneficial in securing a co-operative spirit and give opportunity for expression of thoughts and ideas which might otherwise never be developed. The purchasing agent is the only departmental official who daily comes in contact at some point or other with all other department heads, and he can do much to promote good feeling, not only as relating to his own department but among other departments. If it is the policy of a company to have department heads specify materials or sources of supply, the purchasing agent may insure a congenial atmosphere for himself by buying whatever type or make of material the various departments ask for, but this practice is not in the best interest of the property, at least from a purchasing standpoint. In your home you wouldn't buy a different brand of coffee for each member of the family, but would select one which would be most agreeable to all who used it. If the purchasing agent can obtain co-operation and maintain good feeling by diplomatically showing the various departments, whenever necessary, that materials from other sources than those specified are either better or as good and cheaper, then the company is deriving benefit from that co-operation. If the purchasing agent takes the attitude that he can arbitrarily buy certain materials which he thinks are best or can be purchased at an advantageous price, or the department heads feel that the purchasing agent must buy only what they may have designated, they are both wrong. There is a middle ground where they must get together and harmonize, and it is by this method the property usually gets the best material at the lowest possible price. Bear in mind, we all have our pet ideas, and while we are sold on them, they don't always look so good to the other fellow. Josh Billings said, "There is always two sides to every question, the wrong side and our side."

---

[*] Abstract of a paper before the Purchasing Agents and Storekeepers' meeting at the annual convention of American Electric Railway Engineering Association, Atlantic City, N. J., Oct. 6-10, 1924.

REALIZE AND SYMPATHIZE WITH THE OTHER FELLOW'S TROUBLES

Probably in a great number of cases the underlying cause of lack of co-operation between the purchasing and other departments can be traced to a lack of effort to appreciate that the other fellow has troubles and difficulties to overcome which are as important to him as those of any one else. The engineering or mechanical department head seldom is interested in the trials and tribulations of the purchasing department—doesn't even think it has any. I don't mean to say that he is selfish, but he has plenty of troubles of his own, and when he is responsible for keeping things moving he wants the best he can get and as quickly as possible. He usually does not pay a visit to the purchasing agent unless he has some difficulty which he wants to unload. At times he feels that he can designate just what he wants and should get it exactly as specified, without considering that the purchasing agent may have experienced difficulties regarding that particular source of supply, which the other department is not familiar with or interested in. Department heads should always consider the results which will be beneficial to the property as a whole and not limit their vision to the particular department they represent, and this should be considered in any effort toward the betterment of an existing condition.

PURCHASING AGENT NEEDS TO BE A GOOD SALESMAN AT TIMES

I have come to the conclusion that if he can do it diplomatically, the purchasing agent should get around once in a while and know something about the other fellow's troubles, but it must be done in such a manner that he will not create the least impression he is trying in any way to help run the other department. He can learn a great deal by getting away from his desk occasionally, and I believe in practically all cases the various department heads are glad to receive such visits and discuss the results they are now obtaining, and are open to suggestions as to possible changes which might effect an improvement, or at least would not change conditions in their department, and yet would be of advantage from the purchasing standpoint. If you are trying to secure 100 per cent co-operation, don't stop—you'll never get it, but you'll get your share. The hen doesn't quit scratching because the worms are scarce.

The purchasing agent has many times to be a salesman and sell some department head on a line which has appealed to him as a good proposition for the company. If his relations have been cordial and he has shown an inclination to work in harmony with the other department, they will usually get together and figure out something for the benefit of the company, and the personal status is submerged in coordinated effort.

We have already heard this afternoon of the opportunity of the purchasing agent to promote good will by his contact with sales representatives, and I think it applies particularly to representatives of local companies who, after having received courteous treatment and consideration and having been given an insight as to the company's side of any question, go out and spread the gospel that the traction people are a pretty good bunch and ought to have a square deal. There are some who feel that the personal element should not exist between the purchasing agent and salesmen, but I am convinced that in proper moderation this is one of the greatest assets in promoting the good feeling and satisfactory business relationships which many electric railway companies have. If the purchasing agent is the point of contact, then the impression which he makes is largely taken as representative of the company as a whole. He can be equally useful as a point of contact between the various departments of the property. If in your dealings you don't show proper consideration for your own associate and his job, what impression have you cast abroad as to your company and its organization?

THINGS FOR THE PURCHASING AGENT TO AVOID

Just as an example, it wouldn't engender good feeling in the family to tell Tom Jones, the master mechanic, that you were going to buy a certain class of material because Bill Smith, the engineer, had used it and said it was absolutely all right, but you could tell Tom Jones that you had asked Bill Smith to test a certain material and would like him to try it also, so that you could ascertain if results were equally satisfactory or otherwise. Then Tom won't think that you have placed Bill's judgment in a higher plane. That's diplomacy.

To establish a reciprocal relationship is the keynote. If we show an inclination to be of service to others they will gladly give us aid when we need it. In reading "David Harum" years ago, two of his aphorisms stayed in my mind; one, "Do to t'other fellow like you want him to do to you—but do it fust!" and the other, "A reasonable amount of fleas is good for a dog—keeps 'im from broodin' over bein' a dog." We don't have to worry in the electric railway game about not having a reasonable amount of troubles, and if we try to share the other fellow's and do it first, we will often lighten our own. That's co-operation.

If a purchasing agent seems to be antagonized in any way by other department heads, the chances are he has so conducted his affairs and failed in service as to give them cause for not wanting to deal through him, and the company as a result will probably suffer with a multiplicity of varying materials for similar needs which should be simplified or standardized for all departments. Remember this, you can't win a heavy-weight title by doing light-weight stunts!

FINE FELLOWS IN THE RAILWAY GAME

I think, however, that many of you are as fortunate as I am in being connected with a property where the cooperative spirit is highly developed, and yet we have no orthodox rules or regulations. We like to talk things over at times in an informal, friendly way, and we are always willing to take advice from the older and more experienced heads. It's just a family affair, and, as happens in the best-regulated families, some day Jack may take Fred's bicycle or air rifle without permission, but you know how soon they have things all fixed up again. So one department may occasionally tread upon another's toes, as must always happen in your "rush-hour travel," but in a short time the load has lightened and you are all comfortably seated again. You can't find a better bunch of fellows than there are in this electric railway game—both sides, operating and supply—and there is no reason why we can't show other industries what co-operation really is.

Luncheon of Educational Directors

A LUNCHEON of educational directors of electric railway companies in attendance at the convention, with some others interested in the program of the educational committee, took place on Tuesday in one of the private dining rooms at the Marlborough-Blenheim Hotel. Myles B. Lambert of the Westinghouse Electric & Manufacturing Company and a member of the committee on education presided in the unavoidable absence of Edward Dana, chairman of the committee.

For the benefit of those present, Mr. Lambert outlined the work done by the committee on education during the past two years. Those engaged in educational work then told of the methods followed by them, and there was general discussion of educational problems on electric railways.

Those in attendance included Myles B. Lambert, W. W. Holden, educational director San Antonio Traction Company; H. M. Robinson, educational director Northern Texas Traction Company; C. S. Coler, educational director Westinghouse Electric & Manufacturing Company; F. N. Catherman, department of Engineering Extension, Penn State College; L. A. Armistead, librarian Boston Elevated Railway; E. J. Murphy, statistician American Electric Railway Association; George A. Barnes, Galena Signal Oil Company; H. W. Blake, ELECTRIC RAILWAY JOURNAL, and Henry H. Norris, McGraw-Hill Company, Inc., New York.

Engineering Association Proceedings

Among Outstanding Achievements of the Year Are the Publication of the Manual in a Bound Volume and the Co-operative Work with Other Organizations—Many Important Recommendations Are Embodied in the Reports of the Committees—Technical Work Done Shows Progress of Modernization

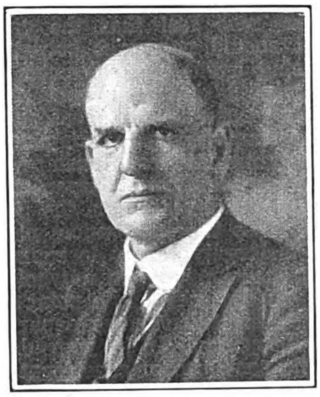
THE first meeting of the Engineering Association at its forty-third annual convention was called to order Monday afternoon, Oct. 6, by President H. A. Johnson, who opened the meeting by presenting his annual address.

Address of the President

In his presidential address to the Engineering Association H. A. Johnson called attention to the fact that more than 200 of the foremost electric railway engineers in the country have been actively engaged during the past year in the work of standing and special committees or in looking after the interests of the association before other national organizations and governmental bodies. Among the subjects emphasized was the publication of the Engineering Manual in a bound volume to replace the previous loose-leaf form. In addition to the cloth-bound volume, containing the entire Manual, paper-covered sections have been printed which contain all the specifications and recommended practices in each of the eight main subdivisions. For some time it had been apparent, Mr. Johnson said, that the mechanical construction of the Manual was wrong. It would not lie flat on the desk for convenient reference. Many drawings were large and cumbersome and very few volumes were being kept up to date by the proper elimination of obsolete sections and the insertion of new sections. After several years of study, therefore, it was decided to publish the Manual in a bound volume which would be republished every third year.

The work in connection with the American Engineering Standards Committee has more than doubled during the past year. Fifty-two men are now representing the association in various ways on the American Engineering Standards Committee. At times it has been rather difficult to obtain engineers of standing and reputation to undertake this work, in spite of its importance. Mr. Johnson, therefore, urged the members to accept appointments upon A.E.S.C. committees whenever possible.

During the year the interests of the member companies have been protected by co-operation with other national organizations in the study of problems of mutual interest. Committees have worked with the National Fire Protection Association in the development of tentative regulations for the wiring of electric cars and carhouses, with the American Bureau of Welding in the study of welded track joints, with the American Society of Mechanical Engineers in the formulation of rules governing the manufacture of air reservoirs, with the Society of Automotive Engineers in studying details of motor coach design, with the American Society of Heating and Ventilating Engineers on the ventilation of automatic substations, with the American Railway Engineering Association on a number of maintenance of way matters and with the Division of Simplified Practice of the United States Department of Commerce.



Charles H. Clark
President-elect

There is no doubt that the electric railway industry, as a whole, is in a more healthy condition than it was one year or two years ago. Some say the electric railways have "come back," but there is a great amount of improvement still to be made before the industry will be in the best condition to give the kind of service which the public demands. There is too small a difference between the gross receipts and the cost of operation and maintenance. One of the most satisfactory ways of increasing the net receipts is to decrease operating and maintenance expenses, and the Engineering Association can undertake no piece of work which would be more valuable to the companies than in finding some way to reduce these expenses and thus increase the net receipts.

It has generally been conceded that most of the rapid industrial progress which we have enjoyed during the past two decades is due to engineering accomplishment. Many operating companies are without sufficient engineering talent to obtain the best results, Mr. Johnson said. There may be an engineer of maintenance of way and an engineer of power who are specially trained in these subjects, but very often the shop and car equipment departments are getting along with a personnel of trained practical men only, without any technical assistance. The car is the instrument of service around which all of our effort is planned and many costly mistakes in its design and maintenance can readily be made when the proper technical skill is lacking. Many companies would do well to provide more engineering skill in their rolling stock departments.

The operating of the cars and the construction of schedules to meet the conditions is just as much an engineering problem and should receive just as close attention as the design of track, cars and power houses, according to Mr. Johnson. Few engineers have been attracted to this branch of the work and on many railways the schedules are made without a careful scientific analysis of the requirements. On such properties there is a great need for a type of engineer who might be called a "transportation engineer," who would have a general working knowledge of all of the engineering problems on the system, including power, distribution, track, cars, schedules and operation and would devote his time to co-ordinating the work of the different departments so that there would be the maximum amount of co-operation within each organization.

In closing, the president mentioned the work of the committee on foreign operation. He called attention in particular to the fact that railway operation is so much more quiet in Europe than in the United States. For that reason he recommended that the various committees of the association, especially the equipment and way committees, undertake a study of methods for the elimination of noise in electric railway operation.

At the conclusion of the address the association moved to extend a vote of thanks to the manufacturers who assisted in arranging the instructive exhibit of standards.

The reading of the report of the executive committee was dispensed with, as it is to be printed in the association's Proceedings, but the report of the secretary was read by G. C. Hecker, special engineer of the association. In his report the secretary referred to the various committees that have been co-operating with other societies in work of mutual interest, and said that the association now has representation on 25 sectional committees and three special committees of the American Engineering Standards

Committee. The work of revising the Engineering Manual was referred to, together with a statement as to the value of this accomplishment. In the statement of membership presented, a net increase of 10 member companies was shown. The report of the secretary was adopted by the association.

The president appointed the following committee on resolutions: Charles R. Harte, chairman; Morris Buck and Daniel Durie.

No report was presented by the special committee on unit basis for voting on standards, but a recommendation was made by the committee that the work be continued. The report of the special committee on Engineering Manual was presented by R. C. Cram, chairman, as follows:

Engineering Manual

The Engineering Manual has been published in its revised book form, having been distributed to the membership in July, 1924.

The principal changes, aside from that of form, are in the arrangement into eight sections of classes covering the several phases of Engineering Association work and the scheme of documental identification. The sectional arrangement permits publication of any one of the classes separately, for use where the entire book would be inconvenient.

The work of revision has been no light task, but the several standing and special committees have actively cooperated with the committee. The actual compilation was made by G. C. Hecker, special engineer of the association and the committee expressed its appreciation of his invaluable assistance in the work.

Future revisions of the Manual will be made easier if the standing committees will endeavor to present new or revised matter in the form governing the style of reports and specifications and it is believed that the committee on standards should place more emphasis upon the need for closer adherence to style before new or revised matter has its approval for insertion in the Manual.

The future work of the committee will consist in editing material presented for supplements and for periodical revisions of the book.

The committee recommended (1) That the standing committees be directed to consider the subject of "revision of existing standards and recommendations" as of first importance, taking precedence over all other subjects assigned. (2) That the committee on standards be requested to pay particular attention to the form of reports and style of specifications as presented by the several committees, with the view toward requiring adherence to form, in so far as practicable, before giving its approval to matter presented for insertion in or revisions of the Manual.

The report was signed by Charles R. Harte, Daniel Durie, and R. C. Cram, chairman.

The committee on engineering symbols presented no report, but a recommendation was made that the work of the committee be continued. The report of the special committee on air reservoir specifications was presented by R. H. Dalgleish, chairman, as follows:

Specifications for Air Reservoirs

The committee reported that it had worked in co-operation with the boiler code committee of the A.S.M.E. and that the later committee had agreed to include in its specification for unfired pressure vessels a provision which allow street railway air tanks to be made of material ⅛ in. thick. In the original draft of the A.S.M.E. specification the minimum thickness was ¼ in. With the exception of a requirement which limits the length of tanks so that they cannot be longer than 2½ times the diameter, the unfired pressure vessel code in its present form was considered satisfactory in so far as it covers street railway air tanks. The committee held that the association's specifications for air tanks should be in accord with the A.S.M.E. unfired pressure vessel code and recommended that the committee on air reservoir specifications be continued for another year in order to allow it to prepare specifications after the A.S.M.E. committee has completed its code.

The report was signed by L. J. Davis, C. A. Ives, J. A. Luper, J. S. McWhirter and R. H. Dalgleish, chairman.

H. H. Adams moved that the report be accepted and that the ensuing committee be instructed to formulate a set of rules for the inspection of air reservoirs. This motion was adopted.

The report of the committee on heavy electric traction was presented by H. F. Brown, assistant electrical engineer New York, New Haven & Hartford Railroad.

Heavy Electric Traction

The first subject assigned to the committee on heavy electric traction was to revise, bring up to date and rearrange the bibliography of heavy electric traction for publication in pamphlet form. The actual compiling is being done by Professor Warner of Yale University. The revised bibliography should be available in stenciled form early in 1925. It is the aim of the bibliography to contain all important articles on heavy electric traction published subsequent to the year 1904. The major part is to be restricted to 15 American and 15 foreign publications, which have been selected as covering the widest field of this activity with a minimum amount of duplication. The committee believes this work will need further supervision and recommends that this subject be reassigned to the ensuing committee.

Data were collected and tabulated on (a) Branch line electrification, (b) self-propelled cars. The operation of passenger service with steam engines and two or more trailing cars on branch lines generally shows a loss. The electrification of branch lines is entirely practicable from an engineering standpoint, but in many cases the first cost may be so high as to introduce prohibitive fixed charges out of proportion to the receipts from a small passenger and freight traffic. Gas-engine drive is being tried out rather extensively with small single end operated cars, and to meet the demand for larger cars and locomotives, experimental equipment is being developed with multiple-unit control of two or more gas engine driven trucks. Gas-electric equipment is available for self-propelled cars and locomotives and apparently offers operating and economic advantages justifying its initial expenses under some conditions. Oil-electric drive, employing high-speed semi-Diesel engines, is being experimented with and apparently holds promise of ultimately providing a self-propelled car and locomotive adapted to use low grade oil, thus broadening the economic application of self-propelled equipment. The committee recommends that this subject be given further study.

On the subject of articulated trains the committee stated that articulated train design and operation in the United States is, at the present time, more or less in a state of experimentation. There are many features which will, no doubt, prove of considerable advantage in improvement on both rapid transit service and surface cars. In England and on the continent, articulated steam trains have been operated for some time. It is reported that the riding qualities of the cars are improved and that the strains on the trucks, bodies and rails are reduced.

In rapid transit service there is a tendency to reduce the number of men comprising the crew. Where cars have been operated with long overhangs on sharp curves it is impossible for passengers to pass freely from one car to another. With the articulated train the overhang is done away with and passengers may pass freely and safely from one car to another on account of the lack of lateral movement between cars, passage being provided through a drum or diaphragm.

To the patrons of rapid transit lines one of the most common criticisms is noise. The noise emanates largely from the trucks and brake rigging and is magnified by the general construction of the subway itself. Such noise can be improved greatly by the reduction of loose parts in the general car construction. It is quite reasonable to assume that by operating trains in articulated units with the reduced number of trucks, brake rigging and movable parts and side thrust, considerably less wear will be noted and marked reduction in noise be found.

Another cause for complaint is brought about by uneven acceleration and braking of trains. With trains of articulated units the tight lock couplings, reduction of the number of control units and braking units permits of closer adjustment of regulating parts and smoother operation is to be expected. As a third item to the credit of articulated train operation, where the crew is reduced it is necessary to control the auxiliary circuits from fewer points, depending on the train combination, and such reduction of course reduces the number of auxiliary devices such as lighting, switches, fuses, relays and supplies, the wiring all tending toward reduction of failures in service.

The committee recommended that the subject be discontinued until actual operating data from existing experiments is available for study and analysis.

A study was made of connections between cars used in train operation, including electric, mechanical and air couplers. This was handled through a questionnaire. The consensus of opinion was that M. C. B. couplers should be used only when cars from foreign roads or standard freight cars were to be handled. Chief among the suggestions for improving designs was the provision of a heavier anchorage, improvement in the uncoupling devices, to harden the wearing parts and make them removable, provide means to prevent kicking out of line in coupling and lubrication of the main draft swivel casting.

Practically all roads using automatic couplers felt that they are very successful.

Practically no data were secured on cost of maintenance of the various types of couplers, and such data as were collected varied so much that no definite conclusions can be drawn. However, it appears that the maintenance of automatic couplers is invariably lower than the maintenance of other types of control or bus-line couplers.

The committee felt that no definite recommendations as to standardization of any types of couplers should be made at this time, but that the data collected should be made available to manufacturers and operators to serve as a guide for the future. It is recommended that further study of this subject be discontinued, at least for one year.

The report was signed by A. H. Armstrong, J. M. Bosenbury, Morris Buck, H. W. Cope, J. H. Davis, J. V. B. Duer, E. C. Johnson, Norman Litchfield, J. O. Madison, L. S. Wells, H. F. Brown, A. H. Daus, C. R. Harte, sponsor; J. J. Sinclair, vice-chairman, and John C. Davidson, chairman.

In the discussion following the presentation of the report on heavy electric traction, J. H. Lucas, superintendent of rolling stock Milwaukee Electric Railway & Light Company, emphasized the value of continuing the study of the articulated train. Other speakers indorsed this view and C. R. Harte moved the acceptance of the report with the recommendation that subject No. 3, which included a study of train operation with particular reference to articulated trains, be continued by the ensuing committee.

N. W. Storer, Westinghouse Electric & Manufacturing Company, said that train operation is the logical means for increasing the capacity of city streets. Except for the actual space taken by the second car, he doubts if trains introduce any traffic complications. He believes the subject is a live one and should be continued.

J. C. Thirlwall, General Electric Company, was of the opinion that articulated trains are inflexible, since they cannot be split up. He considered them not suitable except on large units for rush-hour service. With regard to the electrification of branch line roads, he said, the plans for most electrifications contemplate handling all service with electric locomotives. In the case of the Missouri-Kansas-Texas Railroad, the Dallas-Denton line has been electrified for passenger service only, a light construction, with a comparatively small capacity power distribution system, being used. Freight is to be handled with steam locomotives as in the past. The advantage of the new plan is that it will give hourly passenger service with light-weight electric cars. Thus, the advantages of electrification are obtained at a much lower cost than if the system were of sufficient capacity to handle all the freight service.

F. H. Miller, Louisville, believed that the articulated train may have a field. He mentioned as an interesting point that in a case where there was an objection to the use of one-man cars no objection was raised by the city to the use of two-car trains operated by two men.

The report of the heavy traction committee was accepted with the understanding that subject 3, that of articulated trains, will be continued.

The report of the committee on way

matters was presented by Chairman H. H. George. Abstract of this report follows:

Way Matters

Ten subjects, including a review of existing standards, were investigated during the year by the committee, and were discussed in a comprehensive report 127 pages in length. An unusual amount of interesting and valuable data was collected. Definite conclusions were reached on four of these subjects, and it was recommended that their study be discontinued. It was thought that investigation of the other six should be continued by the ensuing committee.

Subject No. 1—*Standardization of Frogs.*—The work of the committee this year provides 8 frogs of each hand for car clearance branch-offs; 7 frogs of each hand for other branch-offs; and 3 frogs for turnouts and crossovers for ordinary conditions, a total of 33 frogs. In addition, 6 of the A.R.E.A. frogs are standardized for conditions similar to steam railroad operation. The adoption of the committee's recommendations will provide a complete system for the use of designers of street railway layouts comparable with that used on steam railroads and represents a tremendous reduction in the number of frogs required as compared with the original practice.

Subject No. 2—*Design of Substitute Ties.*—A list of users of various types of substitute ties was obtained from their manufacturers and a comprehensive questionnaire was prepared and sent out to all such users and to every member company of the A.E.R.A. as well. A large percentage of those to whom the data sheet was sent did not reply and the answers contained in many of the replies received were either very incomplete or indefinite. This appears to indicate, in the opinion of the committee, either an unwillingness to go on record as to the results of experience with substitute ties, a regrettable lack of records as to what has been done and what the results have been, or a complete indifference to the efforts of the committee to secure information on this subject. The committee heretofore did not feel justified in drawing any conclusions and recommends that further consideration of the subject be continued by next year's committee.

Subject No. 3—*Investigation of Welded Rail Joints.*—Since this committee had no funds for carrying on any research work of its own and because this was delegated to the committee on welded rail joints, there was practically nothing the way committee could do except to co-operate with the larger committee. The report is, therefore, only a brief review of what has been accomplished to date by the committee on welded rail joints. Nearly all of the test joints supplied by various railways have been tested to destruction and the results were embodied in a report which has been distributed to all member companies. In conclusion the committee recommends that the subject be continued and reassigned to the ensuing committee with instructions to co-operate with the committee on welded rail joints; that the latter committee be urged to adopt a definite program for future work and to proceed with it as rapidly as possible; that publicity of the work of the committee on welded rail joints be given as far as practicable through the official organ of the A.E.R.A. and the technical magazines supported by the industry, and that the executive committee of the committee on welded rail joints be requested to submit to every member of the general committee a monthly résumé of its activities.

Subject No. 4—*Design and Specifications for Solid Manganese Steel, Electric Over Steam Railroad Crossings.*—The committee submits two designs for solid manganese-steel crossings—steam railroad over electric railways for adoption as recommended design. These plans had previously been submitted to the committee on way matters by the track committee of the A.R.E.A. in 1923 and had been returned to the latter committee with certain suggested changes, which changes have since been approved by the track committee and the plans adopted as recommended practice by the A.R.E.A. last March. The committee also recommends that the subject of crossing design be continued by the ensuing committee.

Subject No. 5—*Standardization of*

Switches and Mates.—In considering this subject the committee limited its study to the matter of tongue switches, as this was the original intention in suggesting the subject for assignment and the first step was the development of data covering switch tongue design. The committee made substantial progress and has every reason to believe that the subject will be satisfactorily concluded, and recommends that it be continued by the ensuing committee. For flangeways and gages on curves the committee has compiled a very definite set of specifications intended to replace former Manual Section Ws 2a, which was withdrawn in 1923 because of the adoption of a number of new standard wheel flanges. The committee recommends its adoption and that the subject be discontinued.

Subject No. 6—*Narrow Groove Guard Rail.*—This subject was assigned because of the adoption by the association in 1923 of two wheel flanges "C" and "D" having a thickness of 1 in., or $\frac{3}{16}$ in. and $\frac{1}{8}$ in. less, respectively, in thickness than the standard flanges "A" and "B" adopted in 1907. In making its analysis the committee checked its data by two independent methods, and as the result of its investigations concluded that there was not a sufficient number of requirements for a narrow grooved guard rail that could not be met by using the standard guard rails by changing the track gage, to justify rolling a new section with a narrower groove. The committee, therefore, recommends that the subject be discontinued.

Subject No. 7—*Standard Hook Head Railroad Spike.*—The committee considered a number of manufacturers' designs as well as that of the standard spike of the A.R.E.A., and finally recommended the adoption of the latter by our association as being in the best interests of standardization. The committee further recommends that the subject be discontinued.

Subject No. 8—*Surface Hardening of Rails at Mill and on Street.*—A considerable amount of information was collected covering three processes for surface hardening of rails which have been tried out on this continent and abroad of recent years. The committee presents these data to the association this year for the first time under one cover. While the committee did not feel justified in drawing conclusions, in view of the fact that the various processes are still more or less in the experimental stage, it is satisfied that further study of the subject is justified and recommends that it be assigned to the ensuing committee.

Subject No. 9—*Specifications for Tie Rods.*—In analyzing the requirements for tie rods the committee listed the controlling dimensions of 99 girder rails, 11 T-rails, 19 foreign rail sections, and one center bearing rail, a total of 130 rails. The analysis covers standard gage track only, since for any other gage it is only necessary to increase or decrease the length required for standard gage by the difference between gages. With the lengths of the threaded portions as given on plan W9701-24, the 61-in. tie rod will satisfactorily meet all girder rail requirements, while the 63-in. rod will satisfactorily meet all T-rail requirements. The committee feels that it is justified in recommending their adoption as a recommended specification, and further recommends that the subject be discontinued.

Subject No. 10—*Review of Existing Standards.*—The committee has submitted certain revisions of the specifications for the manufacture of open hearth steel girder rails for the purpose of providing for the rejection of rails under certain conditions, and also to cover the matter of drilling, punching and milling. It also submits certain revisions of the specification covering the matter of furnishing standard section T-rails in 62-ft. lengths. The attention of the ensuing committee is called to the necessity for revising the drawing of the standard girder guard rails so as to show the width of flangeway at the gage line.

This report was signed by C. A. Alden, V. Angerer, S. C. Baker, R. J. Custer, W. R. Dunham, Jr., E. B. Entwisle, G. C. Estill, R. B. Fisher, C. F. Gailor, A. E. Harvey, J. H. Haylow, J. S. Hyatt, B. P. Legaré, R. H. Pinkley, A. T. Spencer, J. B. Tinnon, C. L. Van Auken, W. W. Wysor, R. C. Cram, sponsor, E. M. T. Ryder, vice-chairman, H. H. George, chairman.

With regard to standardization of switch tongues, W. W. Wysor, Baltimore, stated that he believed the tongue should be made thinner than is generally used today. He said the value of this construction is that it is possible to obtain more bearing for the tread of the wheel than is possible with the present standard tongue. Others taking part in the discussion were E. M. T. Ryder and Victor Angerer. With regard to the proposed drive spike, Mr. George stated that this is already standard with the American Railway Engineering Association and that a number of manufacturers are now making them with automatic machinery.

The recommendations of this committee were received singly and then the report was accepted as a whole.

The joint research conducted by the committee on welded rail joints was reported on by Sub-Chairman Wysor. This report is the same as subject 3 of the way committee report. Mr. Wysor said that since the report was written the big Emery testing machine at Washington has been reassembled and that the work of testing has now been completed. In reply to a question, he stated that four strain gages are used: (1) On the lip, (2) on the web, (3) on the head, (4) on the base.

E. M. T. Ryder, way engineer Third Avenue Railway, spoke briefly concerning the tensile tests that had been made and called attention particularly to the report of the committee on foreign practice in connection with noise of operation. The possibility that differences in the top and bottom welds cause variation in the result of tests was mentioned by R. H. Dalgleish, chief engineer Capital Traction Company. In connection with this, H. H. George, engineer maintenance of way Public Service Railway, suggested that the Bureau of Standards could probably furnish additional details of interest.

The Market Street Railway of San Francisco has made 16,000 bolted joints since 1910 without a single failure, according to B. P. Legaré, engineer maintenance of way. These joints are on 9-in. rail, each joint having twelve 1-in. bolts. All joints are made by one gang, and in the opinion of Mr. Legaré the care exercised in making the joints is largely responsible for the success. W. W. Wysor, chief engineer United Railways & Electric Company, Baltimore, also emphasized the importance of care in the set-up of joints.

The report of the committee was unanimously accepted.

Tuesday's Session, Engineering Association

FIRST Vice-President Clark opened the Engineering Association meeting on Tuesday in the absence of President Johnson and introduced President White of the Accountants' Association, who presided during the presentation of the report of the joint committee of the Accountants' and Engineering Associations on engineering accounting. This report, which is printed below, covered suggested subdivisions of the standard classification of accounts for the way and structures department.

Joint Committee on Engineering Accounting

The report this year was a continuation of the report for 1923. Last year's committee recommended the adoption of a number of subdivisions of the standard road and equipment accounts and the operating expense account, as contained in the Interstate Commerce Commission's standard classification. The committee this year took the subdivisions recommended by last year's committee and divided them, after a few minor changes, into three groups. Each group is complete in itself, but the group for Class I is intended for those companies desiring considerable detail in their accounts, Class II, with fewer subdivisions, for those companies desiring less detail, and Class III, with the least number of subdivisions, for those desiring still less detail. The committee recommended that these sub-classifications, if accepted by the association, be submitted to the committee on standard classification of accounts for adoption, and that the work of the committee be continued in order that a subdivision of the equipment group of accounts might be prepared.

The report was signed by E. D. Dreyfus, Clifford A. Elliott, Herbert Jackson, L. J. E. Foley, J. E. Heberle, P. R. Jacques, C. R. Harte, sponsor; Leon R. Brown, and G. F. Dinneen, co-chairmen.

In the discussion of this report T. B. MacRae, general auditor Chicago Rapid Transit Company, said that the accountant was generally ready to give the engineers anything they wanted in the way of subdivided figures, if they would state their requirements. M. W. Glover, general auditor West Penn Railways, said that the chief question involved in the adoption of such a subdivision was whether or not the results obtained warranted the expense of the subdivision. He warned against sacrificing accuracy for detail and pointed out that it was very difficult to get maintenance men, particularly on trackwork, to make charges correctly to a detailed list of account numbers. He felt that the question of the degree of subdivision to be made should be left to the individual railways rather than to have the association determine this matter.

R. N. Wade, engineer maintenance of way Chicago Rapid Transit Company said that it was impracticable to carry out some of the divisions in charges called for in the report and cited the division of the cost of excavating various types of paving as an illustration of the difficulty that would be encountered. W. B. Tuttle, president San Antonio Public Service Company, felt that although individual companies might not find it possible or desirable to carry out the full subdivision as presented in the report any necessary combination of the various items could be made, but the general order of accounts would be the same, and some degree of uniformity would be obtained in the classification on various properties.

The report was accepted by the association for publication in the proceedings as a guide for member companies. It was also decided to continue the work of the committee and to carry out its recommendation for the preparation of a similar subdivision of accounts to cover the work of the equipment department.

Upon completion of the discussion on this report the accountants withdrew to their own meeting hall and President Johnson took charge of the engineering meeting. The report of the committee on unification of car design, was abstracted by Chairman H. H. Adams, Superintendent of shops and equipment Chicago Surface Lines. An abstract of the report on this subject follows:

Unification of Car Design

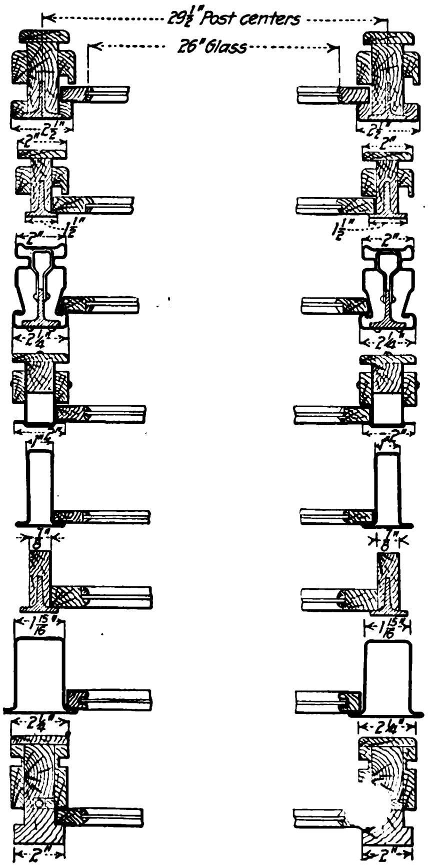
The committee on unification of car design reaffirmed the recommendations contained in the 1922 report of the committee, and to obtain information covering cars built during the year 1923 sent out a questionnaire to the companies that purchased cars.

A statement of the data obtained from the car builders, showing the dimensions used for recent groups of double-truck city cars in comparison with the recommendations of the committee, is shown in Table I.

The committee found that it was exceedingly difficult to arrive at a standard car that would meet all the requirements of the various properties throughout the country and, therefore, confined its efforts to the establishment of certain uniform basic dimensions for city cars which, it is believed, could be generally adopted.

A side girder plate depth of 30 in. could be used almost universally for this type of car and a 29½-in. dimension for center to center of posts. This would give an acceptable spacing of cross seats. With the depth of girder and the post centers established, the distance from the underside of the sill to the bottom of the top plate and the distance from the underside of sill to the top of the roof determine the size of the side sash and glass. The committee pointed out the desirability of using standard sizes of glass, which will not require cutting at shops.

With the 29½ in. center to center of posts established, a standard width of 26-in. glass can be used with the various constructions of posts and sash now being used by the different car builders. If the large companies will co-operate with the car builders to the end of obtaining general acceptance of the dimensions recommended, progress can be made along the lines as outlined. This is an initial and important step toward unification of car design.



Application of 26-In. Glass to Various Sash and Post Designs on Recommended Spacing of 29½ In.

The committee did not make any definite recommendations as to car lengths or general arrangements, believing that the first step should be to obtain general adherence to the dimensions recommended. If this is successfully carried out, further progress in the same direction can be made in the future.

The committee also considered the possibility of effecting a reduction in the number of types and sizes of miscellaneous parts, including general car body hardware, which are used in the construction of electric railway cars, and recommended that a committee be appointed to study this phase of the problem.

The report was signed by J. A. Brooks, C. Gordon, W. F. Graves, J. W. Hulme, G. L. Kippenberger, J. Lindall, V. Willoughby, R. H. Dalgeish, sponsor, and H. H. Adams, chairman.

As the discussion on the report lagged, Mr. Adams pointed out the need for suggestions and criticisms from the floor in order that the committee might be guided in its work. He said that members should express their views, stating whether or not they agreed with the findings of the committee, and if they did not agree, urged that the objections be brought out.

Some discussion of the possibility of carrying on this work in connection with bus body construction occurred, and P. V. C. See, superintendent of equipment Northern Ohio Traction & Light Company, said that the subject of glass sizes was of considerable importance from the standpoint of bus maintenance. In many cases plate glass is used, Mr. See said, and the bodies are sometimes built so that this material has to be cut to odd sizes, including small fractions of inches.

R. H. Dalgleish, chief engineer Capital Traction Company, Washington, D. C., said that he would like to see the recommendations of the committee followed by members of the association. Mr. Williams, assistant superintendent of equipment Department of Street Railways, city of Detroit, said that they were now following some of the recommendations of the committee, and expected to follow as many of them as possible on future cars. Walter Adams, chief engineer J. G. Brill Company, stated that his company would follow any of the dimensions that are specified by the railway companies.

Following the action of the Engineering Association on the report of the committee on unification of car design, Britton I. Budd, president of the American Association, addressed the engineers. Mr. Budd expressed his appreciation in very glowing terms of the excellent work which has been done during the past year by the various committees and members of the Engineering Association. He also extended thanks for the work on behalf of the executive committee and the entire association. He referred to the report made by the committee on foreign operation and said that he believed that this would be of material assistance in bringing American operation to a higher level. He said that he considered the engineer as the man who must be looked up to particularly for improvements in design and other essential developments necessary for furnishing better electric railway service. Many of the improvements needed, he said, must necessarily originate with the engineers of the various railways, and as the many departments must have efficient tools to do their work, untiring efforts of the different engineers should be exerted toward improving all essentials.

Following the address by Mr. Budd,

TABLE I—DIMENSIONS USED FOR RECENT GROUPS OF DOUBLE-TRUCK CITY CARS COMPARED WITH RECOMMENDATIONS OF A.E.R.E.A. COMMITTEE ON UNIFICATION OF CAR DESIGN, JULY, 1924

Railway Company	Number of cars	Post centers, inches	Width of post at bottom of sash groove, inches	Height from arm rail to bottom of top sash, inches	Height from underside of sill to bottom of top plate		Height from underside of sill to top of roof		Depth of girder, inches	Height of glass in lower sash, inches	Width of glass in lower sash, inches	Height of glass in upper sash, inches

the report of the committee on equipment was presented by F. H. Miller, chairman.

Equipment

The equipment committee reported on five subjects. The first of these was a study of gearing, including long and short addendum tooth formation and web hole standardization. Questionnaires were sent out this year, following the practice of three years previous, and additional information was received. The majority of replies indicated that helical gears run more quietly both when new and half worn. During 1923 approximately 28 per cent of all gears sold were helical gears. The question of web hole standardization has been studied in co-operation with the American Gear Manufacturers Association, and a table for the size and location of web holes in gears was submitted as a recommended standard. Four holes are to be provided in each gear, and the diameters of these vary from 1 in. to 3½ in., by ½ in. steps. The diameters of the circles on which the holes are set vary from 10 in. to 19 in., by ½ in. steps.

The second subject reported on was various devices for trolley contact and their effect upon trolley wire. This was studied in co-operation with the committee on power transmission and distribution. The work of the two previous committees was extended and additional information secured on the life of current bearing and collecting equipment by replies to a questionnaire. Tests have been started by member companies on sections of trolley wire with all new equipment, to determine wear and periodical inspection and measurements will be tabulated for future study. The conclusions of the committee were:

1. That trolley wheels of manufacturer's standard compositions give mileage equal to those using special composition.

2. That solid wheels are preferable to built-up types.

3. That standard "U" or "V" groove is most satisfactory under normal operating conditions.

4. That the life of trolley wheels, contact devices and trolley wire can best be obtained by conducting life and mileage tests on sections of wire with regular inspection, measurement and tabulation of the equipment under test.

Subject 3 included a review of Manual sections on equipment under the heading of Miscellaneous Methods and Practices. The most important ones were revised and brought up to date and much valuable information was selected for including in these reports. The headings of the various miscellaneous methods and practices, which were submitted, are:

Rules for inspection of air brakes and brake rigging; air compressor maintenance; comparison of car weights with seating and carrying capacity; repairs of armature and field coils; construction and repairs of commutators; insulating materials for railway repair shop use; systematic inspection of car equipments; lubrication of car equipment; protective devices for car equipment; armature and axle liners; specifications for trolley wheels; systematic inspection of car equipment; car house organization; automatic slack adjusters for brakes.

Subject No. 4 included a study of spring supports for railway motors with a view to the elimination of undesirable types and the standardization of the more desirable ones. This subject was considered by the 1923 committee, and the 1924 committee has furnished additional information. This covers the amount of spring trouble that has developed and methods used to overcome it. The report is in the nature of a progress report and the conclusions of the committee were that there is a considerable amount of trouble with spring breakage, but a large part of this has been remedied through proper design of springs, which give ample movement to the motor without overloading.

Subject No. 5 included a study of existing practices in regard to the inspection period for car axles. A set of rules was developed for car axle inspection and limit of wear, and the committee recommended that this be included in the Manual under Miscellaneous Methods and Practices.

Subject No. 6 consisted of a study of the air-brake tests which were conducted under the auspices of the Central Electric Railway Association. The following conclusions were concurred in by the equipment committee:

1. There is no one best way to stop any car in an emergency. In general, the best way will depend somewhat on the type of brake and motor equipment.

2. As a broad rule, subject to occasional exceptions, it may be said that the best way to stop a car equipped with air brakes, is to throw the controller to the off position, applying emergency air and sand simultaneously.

age.

3. Electrical methods of braking—that is, reversing motors and bucking motors—subject the equipment to very severe strains because of the abruptness with which the braking force is applied. The value of these methods is more apparent than real except in those cases in which the air brakes from some cause are inoperative.

4. Of the two electrical methods, reversed motors and bucking motors, the reversed motors method is the most effective.

5. If the motors are reversed in conjunction with emergency air and sand, skidding invariably results, and even under very good rail conditions the results are not superior to those obtained by using the air brakes alone.

6. The electrical braking methods are more likely to produce erratic results than the emergency air brake, and for this reason should not be resorted to as a general practice.

7. Because the rail conditions, under which the tests above referred to were made, were better than those ordinarily obtained on city streets, the results should be regarded as better than aver-

8. The best way to stop the Birney safety car in emergency is for the motorman to raise his hand from the controller handle. This is true only when the car is running with brakes released. When brakes are applied the brake valve should be thrown to the emergency position.

The committee making the tests confined itself to an analysis of the best methods for making emergency stops and did not analyze in detail the results and the reasons therefor of any particular method.

Without a clear exposition of the fundamentals affecting the length and time of stop (which this committee was not considering in so far as a particular method was concerned) misleading conclusions may result from a consideration of distances and times for a stop developed from particular tests. It is therefore considered important that it be generally understood that the report of the committee should be confined to the subject investigated, namely, "what is the best practice for making emergency stops to avoid accidents?"

It is believed that attention particularly should be drawn to the fact that the Birney car as shown in Table No. 1 on page 14, Bulletin No. 13, Purdue University, was very much over-braked as compared with standard practice and that on this account the stops made with it were much shorter than would normally be expected with proper brake equipment and dry rail; with wet rail the over-braked car would cause dangerous skidding and excessive maintenance.

Mention should also be made that the discussion contained in Section 4, entitled "Theoretical Considerations" is based upon a uniform rate of retardation which does not exist in actual service, for the reason that the retarding force does not immediately attain its full value, and with the air brake the brakeshoe friction is continuously changing with a resultant change in the retarding force exerted upon the car.

The committee considered the foregoing conclusions as absolutely sound and represent proper practices to be followed. The results that will be obtained in any specific case, however, largely depend on a number of important and variable factors. In other words, no one can assume, from the results obtained in these particular tests, the definite stopping distance or time because of the variable factors encountered in each and every instance of stopping a car.

The committee considered that in general the best operating results from the safety standpoint can be obtained by the proper use of the air brake equipment; stopping by means of reversed motors or bucking the motors is not conducive to safety.

Subject No. 7 included a review of all existing equipment standards. The following revisions were recommended:

E1-21 (formerly Eb 1c)—*Standard Design of Brakeshoes, Brakeshoe Heads and Brakeshoe Keys*—The new wheel contours adopted at the 1923 convention made it necessary to change a few dimensions for standard brakeshoes. Revised designs were submitted as Figs. 1, 2, 3, 4 and 5. Fig. 6 showed a new design for a standard brake head, shoe and key for 3-in. tread wheels, contours A3 and B3 and 3½ in. tread wheels contour A3½. Wheels 21 in. to 26 in. in diameter.

E8-23 (formerly Em 3a)—*Limit of Wear Gages for Association Standard Flange Contours*—The length of the part of the gage for standard 1-in. flange which projects down on the back of the wheels was made 1 in. longer, and the standard limit of wear gage for 1 3/16 in. flange is to be used for the 1⅛ in. flange.

E14-23 (formerly Et 7b)—*Dimensions of A.E.R.E.A. Steel Wheel Designs*—In accordance with recommendations made by the Executive Committee, the tables for dimensions of steel wheel designs were expanded to bring them into conformity with the new wheel contours adopted at the 1923 convention.

Et 3a—*Specification for Refined Wrought Iron Bars*—The recommendation of the committee was that a specification corresponding to that of the American Society for Testing Materials be adopted as a standard specification. Copy of this A.S.T.M. specification was included in the report.

E5-15 (formerly Et 9b)—*Specification for Quenched and Tempered Carbon Steel Axles, Shafts and Similar Forgings*—In order to clear up a conflict in paragraphs regarding the nominal diameter or thickness of a forging, a revised wording for several paragraphs was submitted.

E103-21 (formerly Et 14b) and E104-21 (formerly Et 15-b)—*Specifications for Case Hardened Forged Steel Gears and for Quenched and Tempered Forged Carbon Steel Gears*—Considerable information in regard to desirable tolerances for the bore of gears was assembled, but the committee considered it had insufficient time to obtain the information necessary in order to make specific recommendations. The recommendation of the committee was that this be studied further by the ensuing Equipment Committee.

E10-19 (formerly Et 18a)—*Wheel Mounting and Check Gages*—A special study was made of this standard with a view of making changes which would define gage limits for the back of wheels as well as for the throats. A new wheel mounting gage was developed for consideration and is included in the report. The recommendation of the committee was that this subject be given further consideration by the ensuing equipment committee.

E12-20 (formerly Et 21a)—*Gages for Journal Bearings and Wedges*—A new journal bearing and wedge gage was made up for the 3-in. x 6-in. journal and was included in the report. A further recommendation was made by the committee that it is desirable to have a one-piece gage for the different sized bearings and wedges instead of several gages as at present.

Subject No. 8 included a study of motor coach design problems. Representatives of the equipment committee met with the Society of Automotive Engineers committee on motor coaches and considered nomenclature and controlling dimensions. It was agreed that a suitable standard nomenclature was desirable, and it was decided to confine this to fundamental types and their principal governing characteristics for the present. It was felt that many features, such as general dimensions, location of emergency door, separate compartment for driver, etc., should properly be left to the contracting parties until general practice becomes more clearly defined. The following tentative proposal was drafted for circularizing for comments and suggestions.

Motor Coaches

City Type

1. Single-deck, having cross or longitudinal seats.
2. Double-deck, having cross or longitudinal seats.

Intercity Type

1. Sedan, having multiple side doors and full cross seats.
2. Aisle, having front and emergency doors and cross seats.
3. Chair, having front and emergency doors and movable individual chairs.

CONTROLLING DIMENSIONS

It was felt that probably the formulating of dimensional standards will eventually be divided between the railway and automotive industries, depending upon which group is most directly interested, but that the beginning of the work should be confined to the list given below by making surveys of the following subjects:

1. *Size of Doorway*—Survey to be made to determine door width, number of panels, and whether folding in or out.
2. *Over-all Width of Body*—The maximum varies from 86 in. to 96 in. and is a matter of legislation in several states. There is a tendency, however, toward universal adoption of 90 in.
3. *Minimum Height of Body, Floor to Roof*—This should be left to judgment of customer, as it is dependent on their requirements.
4. *Overhang*—Not considered important enough to standardize.
5. *Width of Tread*—Survey to be made for treads from center to center of tires.
6. *Dimensions from Center to Center of Springs*—Not important in the program of the committee, as it does not affect interchanging bodies.
7. *Location and Size of Emergency Door*—Largely a matter of state legislation, but survey should be made toward guiding such legislation.
8. *Dimension, Dash to Center of Rear Axle*—One of the most important dimensions to establish and survey should be made to establish a standard.

It was decided that these surveys should be conducted by a committee of the S.A.E., on the basis of coach capacities as follows: (1) Seating 18 passengers, (2) Seating 21 passengers, (3) Seating 25 passengers, (4) Seating 29 passengers, (5) Seating 64 passengers for double-deck types.

As it was felt that not much more could be accomplished until the proposed surveys are completed, the committee recommended that a future committee be appointed to meet jointly with a committee from the Society of Automotive Engineers to develop standards and to co-ordinate the work between the two associations.

The report was signed by: Walter S. Adams, R. S. Bull, W. W. Brown, A. T. Clark, L. H. Fry, J. L. Gould, J. M. Hipple, J. H. Lucas, J. F. Miller, J. C. McCune, A. D. McWhorter, M. O'Brien, E. D. Priest, E. S. Sawtelle, R. B. Smythe, W. G. Stuck, C. W. Squier, J. M. Yount, Daniel Durie, sponsor, P. V. C. See, vice-chairman, F. H. Miller, chairman.

Following the presentation of the report there was some discussion in regard to further consideration of gages for wheels, particularly as the way committee is interested in this subject. The convention approved the action taken by the standards committee with the exception of E8-23, limit of wear gages for association standard flange contours. This, together with Et 13a, proof testing of forgings to determine their soundness after quenching and tempering, and E10-19, wheel mounting and check gages, were referred back to the ensuing committee for the purpose of further study and recommendation.

The report of the committee on wood preservation was presented by A. P. Way, chairman.

Wood Preservation

Five subjects were studied during the year by this committee and are treated in its report. The work followed the same general lines as that done by the special committee of the previous year.

Open-Tank Treatment of Wood Poles—The committee endeavored to obtain a detailed description of open-tank installations in use by operating companies, but the response was very disappointing. Brief description of two installations are included in the report. It is hoped that operating companies will respond more readily next year. It is realized that a joint treating plant for many properties covering a large area would involve too large handling charges, but it is felt that there are many localities where medium-sized properties covering a small area could use a small tank and local wood to advantage, either for their own use or in combination with neighboring companies. It is recommended that the subject be reassigned to next year's committee so that more small plants can be studied and a few general plans prepared from which operating companies may make a selection to meet local conditions. It is recommended further that a study be made of hot and cold treatment by quick temperature changes, as compared with slow change by natural cooling of oil in the tank. The committee is of the opinion that a new grade of heavy creosote oil suitable for open tank and brush treatment should be adopted as a recommended specification.

Brush Treatment of Wood Poles—Last year the association approved specifications for brush treatment of poles, included in which was a specification for treating poles in place, where decay had started at the ground line. This year the committee directed its efforts to making a further study of this phase by collecting information from pole-using companies. It was found that the practice is well under way, particularly among telephone and telegraph companies, with very promising results. It is felt that electric railways are not getting the full value from their investment in timber, and are not doing their share in conserving the timber supply. The report includes replies received from six companies that have had good results with brush treatment of poles, and the committee urges that these be carefully read. From results to date it is evident that the increased life attained by this means will more than compensate for the expense.

Pressure Treatment of Poles—In 1923 this committee submitted a number of specifications for pressure treatment of pine poles for purposes of information only. This year these specifications have been carefully studied along with specifications of other societies, especially those adopted by the American Wood Preservers' Association. From these the committee compiled specifications for treatment of pine poles. Although in some cases it was desired to make further changes, it was felt that the association, in a general way, should follow the practice of the large commercial plants where production is based upon requirements of larger interests, since to insist upon materially different specifications would result in a more expensive treatment. It is therefore recommended that this be adopted as a specification; that air-seasoned poles be used where possible; that the empty cell treatment be used where the public may come in contact with the poles and full cell treatment used elsewhere; that trained inspectors make inspection during treatment; and that the subject be reassigned to the ensuing committee for further study.

Perforation Process—Last year's report contained description of a number of perforating equipments in operation at large commercial plants, but the methods of perforating had not become sufficiently standardized to justify definite recommendations. There seem to be no material changes in methods of perforation other than minor modifications to make a more uniform pattern, and the selection of long and thin perforating teeth that will spread the wood fiber rather than tear it. It is recommended that this subject be discontinued as a separate subject, but included with open-tank treatments.

Review of Existing Standards—A few minor changes were recommended by the committee. These include raw material for creosote oils, and some modifications of apparatus and thermometers for making tests.

As an appendix to the report a discussion is presented concerning the treatment of blighted chestnut. A second appendix deals with the electrical conductivity of treated wood.

The report was signed by M. J. Curtin, J. L. Fritsch, W. H. Fulweiler, E. F. Hartman, W. H. Harwood, E. L. Morier, R. P. Woods, R. V. Achatz, M. B. Rosevear, sponsor; C. A. Smith and A. P. Way, chairman.

The recommendations of the standards committee regarding this report were approved.

The report of the building and structures committee was presented by N. E. Drexler, chairman.

Buildings and Structures

The work of the committee during the year was divided among three general subjects, including the review of existing standards. It was recommended that one of the other subjects be continued by the ensuing committee and that one be discontinued.

Terminals for City and Interurban Service (Passenger).—The work of the previous committee was continued and a number of representative layouts are presented in the report. It is thought that these may serve as a guide to member companies contemplating the erection of passenger terminals. The committee recommends that the manual section covernig urban and interurban passenger terminals be superseded by the corresponding portion of this year's report and that next year's committee study terminals suitable for motor buses.

Freight Terminals.—In continuing the subject this year, plans of a large number of freight terminals, including those obtained last year, were studied. The committee's investigations led to the conclusion that, as the type of building construction and material entering into the same have been pretty well standardized, information which will assist in determining the size and location of the building, ground space required and general track layout would be of greater value to the industry. As a result, plans of a typical layout have been prepared and are submitted. This typical layout is flexible and can be reduced or enlarged to meet requirements. It is recommended that the plans of the typical layout together with the fundamental data on design be adopted as miscellaneous methods and practices.

Combination Terminals.—The study of this subject was continued from last year. Plans of a number of layouts were studied and those shown illustrate modern types of combination terminals which may serve as useful information to member companies. The committee recommends that further study of this subject be discontinued.

Storage and Maintenance of Buses.—This subject has not been studied by any previous committee. Data for the report was obtained from questionnaires and from plans submitted by member companies who operate buses. Plans and description of the Connecticut Company's Grand Avenue garage at New Haven are shown in the report. As this subject is of growing importance to electric railways and is in a period of rapid development the committee feels that a further study of the subject is highly essential and recommends that it be continued by next year's committee.

Review of Existing Standards.—The committee has gone over the various sections of the Engineering Manual relating to buildings and structures. New rules relating to car and car-house wiring are recommended. Changes are suggested in the drawings for small bridges, culverts and trestles.

The report was signed by B. R. Brown, E. D. Eckroad, J. D. Kent, H. R. Stamm, S. J. Steiner, T. H. Stoffel, Judson Zimmer, C. H. Clark, sponsor; N. E. Drexler, chairman, and J. R. McKay, vice-chaiman.

In the discussion regarding the fundamentals that should be inserted in the Manual under subject 1 of the report, it was brought out that material beginning with the location of freight terminals and approximating two pages in length was intended for use. The recommendations of the standards committee regarding this subject were approved.

The report of the committee on car and carhouse wiring was presented by H. H. Adams, chairman.

Car and Carhouse Wiring

As a result of conferences with the National Fire Protection Association, the Western Electrical Inspectors Committee and the Western Association of Electrical Inspection, the committee on car and carhouse wiring formulated some regulations for the wiring and equipment of electric cars and carhouses. These were submitted with the recommendation that the regulations be adopted as tentative for the coming year and that the committee be continued in order to co-operate with the National Fire Protection Association in the preparation of final rules and regulations covering the subject.

In addition to information covering the sizes, current-carrying capacities, etc., of wiring, the tentative regulations included the wiring for operating motors, controllers and resistances; light wiring, electric heaters, signal wiring and storage batteries. The regulations for wiring of carhouses and auxiliary buildings operated by electric traction companies included provision for overhead conductors, third rails and wiring other than that for cars.

The report was signed by A. T. Clark, C. G. Keen, J. Lindall, P. V. C. See and H. H. Adams, chairman.

In abstracting the report of the committee Mr. Adams stated that it was practically the same as that which will be presented to the National Fire Protection Association for its consideration, and that discussion of any points which needed changing would be transmitted to this committee for its consideration in making changes before definite recommendations could be made.

R. S. Beers, General Electric Company, presented a written criticism of a number of paragraphs which his company considered should be modified. These related particularly to the installation of control equipment and which the engineers of his company thought would help to clear up certain portions of the report that now appear misleading.

G. M. Woods, Westinghouse Electric & Manufacturing Company, called attention to some additional points which the engineers of his company thought should receive further consideration before definite rules were established. These related particularly to equipments employing voltages higher than 600.

N. W. Storer, Westinghouse Electric & Manufacturing Company, said that he thought that definite information should be obtained to substantiate each ruling and that very careful consideration should be given to make certain that no definite rules were adopted which might hinder the advance of equipment design. He said that he concurred with the committee's recommendation as to the desirability of establishing some definite rules and giving consideration particularly to conditions which might prove dangerous and result in accidents or fire.

At the conclusion of the discussion the association approved a recommendation that the regulations as presented by the committee be adopted as tentative, with the understanding that the various paragraphs would be elaborated in line with points brought out in the discussion so as to clarify certain sections and that this subject would be given further consideration during the coming year through co-operation of this committee with one from the National Fire Protection Association.

Thursday's Session, Engineering Association

AT THE Thursday afternoon session the report of the committee on power generation and conversion was presented by L. D. Bale, chairman, except subjects 2 and 3, which were abstracted respectively by C. A. Butcher, Westinghouse Electric & Manufacturing Company and F. W. Peters, General Electric Company.

Power Generation and Conversion

The executive committee of the association assigned four subjects for consideration:

1—*Continue the study of a uniform scheme of recording failures of power apparatus and interruptions to service originating within the generating station and substation.*—The assignment limited the scope of the report to failures originating within the plants. After careful consideration of the subject, the committee became convinced that such a study should include all troubles on the system resulting in discontinuance of power supply. In view of this, the committee did not feel in a position, at present, to submit a report on the subject.

It was recommended that the subject be continued through joint action of the power generation and conversion committee and the power transmission and distribution committee, or by a special committee, composed of representatives of the above two committees.

2—*Continue the study of existing practices in design and operation of automatic substations, including the subject, "Remote supervisory control."*—This assignment was divided into four classifications covering the most pertinent questions involved. These classifications are as follows: (a) Application of shunt-wound and compound-wound synchronous converters for various classifications of service; (b) definition and discussion of automatic and semi-automatic substation; (c) automatic railway substation d.c. feeder control; (d) supervisory and remote control systems.

Synchronous converters are used on railway systems primarily to furnish power for the movement of trains. Where traffic conditions are such as to require sustained d.c. bus voltage, the compound-wound machine is desirable for the most satisfactory and economical operation. Where sustained voltage is not essential, the shunt-wound converter possesses certain operating advantages which may well be considered.

In general for railway service there are probably more compound-wound machines used than shunt-wound machines, and for the majority of the installations a compound-wound machine is more suitable.

For the average interurban service, a compound-wound machine is generally considered more desirable. It tends to maintain constant d.c. voltage with varying loads and hence requires the installation of less feeder copper.

For many years past manually operated railway substations have followed more or less conventional arrangements with respect to the nature and grouping of devices in the stations. Switches, instruments and relays are relatively simple with practically all operations of devices dependent upon the activity and ability of the station attendant.

The application of automatic equipment to railway substations has reversed the situation peculiar to manually operated stations, wherein the apparatus loses its former extreme simplicity and the station attendant is eliminated with the resultant advantages of reduced operating costs and more efficient operation, including a more accurate and timely functioning of the station than is possible in the manually operated equipment.

The application of shunt-wound converters to automatic substations simplifies the equipment somewhat, as compared to that required for controlling compound-wound machines, since less resistance is required for load limiting by virtue of the drooping voltage characteristic. Equalizer connections are eliminated with shunt-wound machines in either automatic or manual stations where machines are operated in parallel.

In many manual stations throughout the country, it is the function of the attendant to perform duties other than that incident to the operation of the electrical apparatus. For instance, the duties of ticket or baggage agent may preclude dispensing entirely with the attendant in the event of automatic operation, in which case it has been found desirable to incorporate in the manual station a portion of the standard automatic features with the view of protecting against any damage to the equipment during the absence of the attendant. It is the intention usually to have the attendant simply start the station in the morning and then continue his other duties while the station continues operating unless shut down because of unusual disturbances. Alarm bells are provided to call the operator in case of shut-down and after investigation he may again start the equipment.

The principal difference between an automatic and a semi-automatic station lies in the fact that the former starts and stops itself dependent on load demand and is at all times capable of starting without the aid of an operator if proper conditions exist, while the latter must be started manually. The semi-automatic station will protect itself from abnormal conditions during operation but if it becomes necessary to shut down for self protection, it must be restarted manually.

Because a semi-automatic station depends on manual attendance for the starting operations only, it is customary and desirable to provide all protective devices used in the fully automatic station except those directly identified with the starting operations. In other words, a semi-automatic station is similar to a fully automatic station in so far as operating features are concerned excepting for the elimination of those automatic devices having to do with starting the machine. The direct current side is complete in itself with the usual load limiting features so the station may be expected to function continuously as long as irregularities necessitating shutting down the machine do not occur.

Savings accruing from the elimination of light load losses are not realized in semi-automatic stations because of normally continuous operation.

Failure of an attendant to respond to an alarm indicating a station shutdown by a semi-automatic equipment may result in traffic delays of no small consequence. Also unusual power demands may arise which make it desirable to start up the stations. Should this occur when the operating schedule otherwise calls for the station to be idle and the attendant off duty, difficulty may be experienced in meeting the emergency. In some cases, additional compensation must be given to the part-time attendant because of longer working hours, which will more than offset the additional yearly charges for full automatic equipment.

FEEDER CIRCUIT CONTROL IN AUTOMATIC SUBSTATIONS

Where converters are subjected to infrequent but heavy swinging loads, such as may be due to the acceleration of heavy trains, resistors in series with the feeders, together with resistors in the machine circuit, will limit the current to be commutated, and thereby enable small converters to handle service which otherwise would require larger machines. The only argument for a resistor in the feeder is that it will, under some conditions, be sufficient to hold the load below the value at which the resistors would be cut in between the machine and the feeder bus and thereby prevent penalizing other feeders supplied from the same bus with the consequently lower voltage.

With but a few feeders, as are usually found in interurban substations, it is not difficult to arrange the resistance values and the thermal capacity of the feeder resistors so that satisfactory operation will result. The question becomes one of economics; how much capital shall be invested in a lot of highly inactive cast iron, together with the switching required for it. If, for example, a 500-kw. machine can, by the use of resistance, be made to handle the work of a much larger machine, considerable investment is, no doubt, justified. If not, it is of doubtful value.

In small stations, supplying light interurban passenger service, an automatic service restoring contactor is inexpensive and highly satisfactory. With such equipment no current limiting resistors are used in the feeder circuits. The contactor opens on overload and recloses automatically by the functioning of a relay in a testing bridge circuit set up to function when the resistance of the external circuit has increased to a value above a predetermined minimum. To permit the trolley to be sectionalized at the substation, similar equipment is supplied for each feeder circuit.

FEEDER EQUIPMENT FOR METROPOLITAN SUBSTATIONS

In large metropolitan stations, from which radiate a relatively large number of feeders, the aggregate load in actual service will often reach values such as to bring the current limiting resistors into the machine circuit when the load on any one feeder is not sufficiently heavy to cut in a feeder resistor. Should a given station be overloaded due to an outage on one or more adjacent stations, it may be shut down by overheated machine resistors without a single feeder resistor having been cut into the circuit. Such a condition can be prevented only by installing machine resistors with thermal capacity sufficient for continuous operation. The number of resistors to do this is, indeed, a large item of expense.

It is not desirable to delay the movement, as is done when voltage is reduced. Such, however, is done when current limiting resistors are inserted in the circuit. Congestion on one feeder is usually the result of blockade involving several different lines, so that simultaneously with the overloading of one feeder, other feeders from the station are at less than normal load. The station then is probably pulling the same total or even less than normal load. For the short time only that is usually required, the feeder circuit will safely carry the current necessary to clear the traffic.

The short circuit, selective, automatic-reclosing type of direct-current feeder differentiates between true overload and short-circuit. A legitimate overload, regardless of value, will not open the circuit unless the cable reaches an excessive temperature. A thermal relay then operates to open the feeder and locks it out of service. It must be understood that the current-limiting features in the machine circuit are retained even when this type of feeder is used. The energy developed in or shunted by an impedance circuit due to the sudden change of current which characterises a short circuit is used to operate the circuit interrupter of the feeder equipment. The impedance circuit may consist of a series transformer, a reactor, or a resistor and a reactor connected in parallel. Normal changes of load do not cause a sufficiently rapid change of current to produce energy sufficient to operate the tripping device. The reclosing of the circuit interrupter is dependent on the action of devices in a "feeding out" circuit set up to test the resistance of the external circuit. When the short circuit has cleared or the resistance has increased sufficiently to limit the load to a predetermined value, the feeder circuit is automatically reestablished. In the case of tie feeder circuits, for example, (feeders with more than one source of supply) the feeder contactors in each station will reclose immediately upon the energizing of the feeder, provided, of course, that the short circuit has cleared.

Among the outstanding developments in the art of electrical engineering of the present day are the large, widespread, power systems and apparatus for automatically operating power stations and substations. Both of these developments have reached a high state of reliability. Nevertheless, the need has arisen for some method of knowing what happens in these distant or unattended places. In addition, sometimes, it has become necessary to control some of the operations from a distant point. There are, therefore, these two main needs: (1) Indication of what is taking place at a distant point; (2) control of operations at a distant.

For the sake of simplicity, these will be referred to as "Indication" and "Control."

The requirements for a practical system are as follows: (1) Reliability; (2) simplicity; (3) few control wires; (4) moderate cost; (5) ease of maintenance.

Several different kinds of equipment have been developed to achieve the results outlined. With the idea of using apparatus already developed commercially and keeping the currents within such bounds that existing telephone circuits could be used, the general plan in all of the systems has been to use equipment that has been standardized for use in telephone and telegraph service. Standard auxiliary switches on oil-circuit breakers, and standard coils and relays for opening and closing oil circuit breakers are also necessarily a part of the equipment.

In view of the rapid advance being made in the application of automatic substations, together with remote control systems, the committee is of the opinion that these several subjects should be continued. It is, therefore, recommended that the subject in its various phases be reassigned for study during the coming year.

3—*Ventilation and Noiseless Operation of Automatic Substations* — For convenience, the report on this subject is in two parts, the first dealing with ventilation and the second with the reduction of noise. Obviously, the two subjects are quite closely related.

Ventilation systems may be divided into two main types:

1. Natural ventilation; in which system the heat is dissipated into the surrounding atmosphere purely by virtue of the temperature difference and the natural air currents which may be generated due to the heat transferred. In this case no specific supply of cooling air is directed toward the heated region by any mechanical means; and

2. Forced ventilation, in which system the proper quantities of cooling air are supplied to the heated regions by mechanical means, in which case there may be two further subdivisions: (a) Directive cooling, where the cooling air is directed to the spot where ventilation is required as well as being supplied by mechanical means, and (b) general forced ventilation, where the supply although effected by mechanical means, is general and not directive, such as in general room ventilation by means of exhaust blowers, etc.

A combination of these systems is ordinarily used in the design of practically all standard rotary apparatus, the rotating element being either provided with ventilating fans, or generating air currents by its own rotation.

Obviously, with directive cooling, smaller quantities of air can be used in the dissipation of the losses than in either the case of natural ventilation or forced ventilation without directive cooling, for in the latter cases the ventilating air frequently short circuits the spot to be cooled, allowing the creation of a hot pocket and correspondingly higher temperature rise.

The report contained a detailed discussion of the thermal properties of air, developing figures for the quantity of air required for various converter ratings as given in Table I.

TABLE I

APPROXIMATE QUANTITIES OF AIR REQUIRED FOR GENERAL STATION VENTILATION WHERE MACHINES ARE NOT INCLOSED AND DO NOT HAVE DIRECTIVE COOLING

(Figures correspond roughly to 150 cu.ft. per minute per kilowatt loss)

	Cubic Feet of Air per Minute			
	Rotary Converter Stations		Motor Generator Stations	
Kw. Rating of Unit	With Transformers	Exclusive of Transformers	With Transformers	Exclusive of Transformers
200	4,000	3,000	5,800	4,800
300	5,700	4,200	8,500	7,000
500	8,000	5,500	13,000	11,500
750	12,000	8,500	18,500	15,000
1,000	15,000	11,000	23,500	19,500
1,500	21,000	14,500	32,500	26,000
2,000	28,000	19,000	43,500	44,500
3,000	42,500	29,000	65.000	51,500

It should be distinctly understood that considerations as to load factor, location of air intake and outlet, etc., are of extreme importance, and may necessitate provision for greater quantities of cooling air than those shown, which are based upon nominal rating of the machines and favorable location of air intakes and outlets. With natural ventilation the intake louvers and outlets should be so placed as to take advantage of the prevailing winds in order to insure circulation. The same considerations apply in the use of low-head propeller-type exhausters, as the force of the wind in such cases may be sufficient to reduce the speed or even stop such a fan thereby limiting circulation of the ventilating air.

A number of types of ventilators commonly employed were described and illustrated in the report.

In many stations, natural ventilation can be employed to advantage and economy can thereby be effected in that, in such cases, there is no handling charge for the ventilating air. In such cases, louvers are usually placed in the side walls of the building, such as at St. Louis in the United Railways substations, or if a basement is used such as at Cleveland, they are then usually set below the floor line as gratings or grilles. Roof ventilators are likewise installed to provide for proper ventilation, the driving force for the circulating air being obtained by the tendency of the heated air in the station to rise. Natural station ventilation is always further influenced by the wind velocity.

In the case of automatic railway substations, and especially where noiseproof construction is employed, the results obtained from ordinary roof-type ventilators are somewhat problematical in that the velocities which can be accommodated by the devices are necessarily low due to being generated merely by the stack action of the building, and the wind. The fan action of the rotating open apparatus of standard design is in general indeterminate and cannot usually be credited with any definite value unless suitable duct work or housing are employed. Where attendants are present and windows and doors may be opened to increase the flow of air this indefiniteness has not worked serious hardship, exhaust fans being installed to increase the circulation in cases where the stations have run hot. With the unattended station, however, where windows are sealed (if present at all) and especially in such stations where noiseproof insulation (which is usually also effective heat insulation) is employed in the building construction, absolutely definite removal of the heat must be insured at all times, hence forced ventilation is usually required, either entirely or as a standby for natural ventilation.

With open-type machines in substations, the problem is apparently one of directing the hot air discharged from the rotors of the machines in such a way as to minimize recirculation and vitiation of the air entering the machines. In general, there is a discharge pressure belt or hot blast from synchronous converters and other rotating machines extending around the machine and even into any pit that may be constructed under the apparatus, with an intake cone or a region of suction along the shaft or at the ends of the machines. This hot blast may in cases have sufficient for to seriously impede if not altogether stop the admission of cool air to a machine by way of the pit, where natural ventilation is relied upon. In cases where the fresh air has access to the ends of the machines from other sources, this blast may have sufficient force to then discharge heated air from such a pit through grills which may have been provided for an inlet.

FORCED VENTILATION

As an alternative forced ventilation is frequently employed and must of necessity be used in connection with noiseproof stations where baffling of the cooling air to effectively absorb the noise is necessary, resulting in greater resistances than can be overcome with natural ventilation.

Where housed-in machines are employed the improvement in efficiency by virtue of the use of a separate fan designed for the particular conditions of service, and the reduction in quantity of ventilating air handled may in certain cases effect enough saving in power to compensate, at least partially, for the extra pressures required, and when taken in conjunction with noiseproofing and definiteness of air supply, may present many advantages. The use of enclosed alternating current machines has long been made but the development of enclosure systems for commutating machines has been deferred as the necessity, while in special cases urgent, has not been general. Complete and semi-inclosure has, however, been provided in special cases, though principally for Edison service the difficulties in converters and direct-current machinery being inaccessibility, and difficulty of inspection and maintenance of the current-collecting elements such as the brush rigging, etc.

With the motor generator sets, the tendencies have apparently been more toward inclosure of the alternating-current motor, with semi-inclosure of the generators. In such cases the heated air from the generators is discharged directly into the room, whereas that from the motor may either be piped directly out of the station or may be discharged into the station with the air from the generator. In either case the recirculation of air by the machines is considerably reduced and effective ventilation obtained.

Forced ventilation as applied to open-type machines usually consists of general station ventilation, the fresh air ordinarily being introduced into the pit under the rotating machines and being forced or drawn up against any blast action of the rotating element. In such cases additional exhaust fans may be installed to effect final removal. With ventilating systems of this type directive cooling is not employed in so far as the elimination of recirculation is concerned, hence the quantities of air handled, though somewhat less than with natural ventilation, cannot be reduced to the allowances tolerable with directive cooling. For such general ventilation, consideration must be given to the ambient as well as to the temperature of the fresh air, but in general the allowances should not be reduced appreciably below 125 to 150 cu.ft. of air per minute per kilowatt loss.

For such conditions it is also necessary to have the air introduced either below the machine or in some similar way equally effective in directing it to the apparatus, as merely a general inlet into the room and outlet from the other side has been found to be entirely inadequate, tests indicating that in some cases approximately 60 per cent of the air so introduced was ineffective in producing any appreciable cooling.

VELOCITIES IN VENTILATING DUCTS

In the distribution of air through ducts with forced ventilation, economy in space, equipment and operating costs are the principal criteria when noiseless operation is not essential and does not introduce other limitations. Velocities at the entrance and discharge louvers are generally not to exceed from 1,200 to 1,500 ft. per minute, whereas with interior work they may run up to 2,500 or more. The pressure drop in an ordinary metal duct is approximately equal to one velocity head for each 40 diameters of straight length of pipe, with a right angle causing likewise a loss of a complete velocity head. With concrete ducts the pressure loss per unit length is roughly twice that given for ordinary metal ducts. Various friction constants on air flow can be found in the N.E.L.A. report on ventilation of central station buildings and equipment published in 1923.

Where ducts are used to convey air, natural ventilation being employed, low velocities must be used, determined from the possible draft which may be generated due to the difference in temperature between the station interior and the outside atmosphere. As this capacity is limited velocities of 100 to 400 ft. per minute are usually all that can be generated, and hence the areas of such ducts must be proportionately increased. The computed velocities through louvers should also not exceed these figures when natural ventilation is employed.

TRANSFORMERS

In the small automatic substations where the concentration of power apparatus can be effectively accommodated by natural ventilation, the transformers may be housed in the same building compartment with the rotating equipment with some saving in building construction. With the tendencies toward outdoor switching stations, however, separate provision is frequently made for them. Likewise in larger capacity stations where bus structures and noise-proofing must be given consideration, the ventilation of the transformers can be taken care of to advantage in separate compartments, which further reduces the hazard from fire, and frequently enables natural ventilation to be employed for them, resulting in less volumes to be handled by the forced draft equipment. This arrangement likewise reduces the necessary insulation for sound elimination for such stations where it is desirable to reduce noise, in that the transformer hum can ordinarily be sufficiently silenced by standard building construction to eliminate any nuisance from this source, even in substations specifically designed for noiseless operation.

Sufficient data accurately determined are not available at the present time to make definite recommendations as to the particular limits of applicability of the various ventilating systems. For the smaller stations, and in outlying districts, natural ventilators can well be employed, whereas in the city substations where large powers are concentrated in small spaces, the tendencies are toward forced ventilation or natural ventilation supplemented by blowers which are brought into operation as required. With stations designed for noiseless operation forced ventilation at the present time appears to be essential.

NOISE AND ITS PREVENTION

The most favorable location of automatic railway substations is quite frequently handicapped by the objections advanced by property holders in the immediate neighborhood, especially as regards noise, but also at times at the lack of architectural harmony with the surroundings. It has accordingly been necessary in certain cases to insure practically noiseless operation and freedom from nuisance in order to be able to install the substation in the desired localities.

The nuisance from noise may usually be traced to the individual articles of equipment in a substation; namely, the rotating electrical apparatus, the transformers, the fans, duct work, etc., the chief elements usually being the rotating apparatus. The ultimate source is in practically all cases a vibration which usually, however, is quite complicated and which is transmitted either directly to the atmosphere and hence recognized as noise, or may be transmitted to various elements of the apparatus, foundations and structures, and from these to the atmosphere, thereby causing noise.

It should be understood that the energy of sound waves is usually very small, the amplitude of the vibrations being estimated by various authorities at from 0.00000005 in. for sounds barely audible to 0.005 in. for loud noises, hence the smallest vibrations may be productive of sound and nuisance. In the case of rotating machines these noises and vibrations are usually due to one or more of the following causes:

1. Vibrations and noise mechanically produced by (a) unbalance of rotating element; (b) friction and sliding or rubbing surfaces such as brushes on commutators, slip rings, etc.

2. Air vibrations—produced by windage and ventilation from (a) air roar due to high velocities over surfaces around corners, etc.; (b) siren action due to ventilating slots in rotors and stators.

3. Vibrations produced magnetically and electrically by (a) pulsations due to main flux or field cutting, alternately rotor teeth and slots; (b) unbalanced phases or single-phase operation causing variations in magnetic pull and hence vibration; (c) load current in irregular windings, usually of synchronous machines, causing magnetic pulsations and hence vibrations which vary depending upon the load.

Some of these causes are directly under the control of the designing engineer, whereas others, such as covered by group 1, are primarily a function of shop workmanship and the use of materials, such as brushes, determined from other operating characteristics and are hence practically always present to a degree. On the other hand, the economies of standardized punchings, fractional pitch windings, and interchangeable laminations lead frequently to various combinations of slot ratios and irregular windings, which produce smaller and cheaper machines, but introduce certain magnetic or air pulsations.

In the case of transformers, the vibrations and resulting hum are usually due to the vibratory movement of the laminations induced by the pulsating magnetic fluxes, and depend upon the densities employed and the tightness of the bolting. These noises, however, are usually not productive of great nuisance.

In general, the remedies applicable for these conditions may be divided into three classifications: (1) Removal or reduction of the fundamental vibrations, thereby eliminating the cause of noise at the source; (2) absorption of the energy of vibration or of the noise before it is transmitted to the structures, buildings, and general atmosphere, causing nuisance; (3) directing such noise as may be produced in such a direction as to minimize the nuisance.

In general, each of the foregoing methods is applicable to specific cases, it being the obligation of the manufacturer to reduce the fundamental causes of noise and vibration to the least possible values consistent with operating and commercial necessities and manufacturing facilities. However, in the present state of the art these elements are still present to such a degree that where noiseless operation is essential separate provision must be made in the form of inclosed systems with noise-reducing baffles or some other such means in order to insure freedom from nuisance. Accordingly various means of sound reduction as applied to building construction have been tried, some of which have been productive of very favorable results. Methods of noise reduction developed at the University of Illinois, were given in considerable detail.

In the case of vibrating or noisy machines, several schemes have been tried to prevent the transmission of vibrations and noise to the floor and building structure so that they will not act as sounding boards or otherwise augment any nuisance from those sources. Various methods have been tried to isolate machinery foundations, including cork, rubber and felt pads, etc., either between the machine and foundation or between the foundation block and the supporting mat and floors. Rubber may be adversely affected by oil and there is some doubt as to the utility of felt after extended service due to a permanent set with a tendency toward becoming hard.

In the Miller Street substation of the Public Service Electric Company at Newark, N. J., the foundation for each of the 1,500-kw. motor generator sets consists of a heavy concrete block under the machines, such block being effectively isolated by two layers 4 in. of "Anti-Vibro" and treated with a tar-pitch compound as an assurance against the penetration of moisture, which is further guarded against at the floor line by a plastic asphalt fill over a jute insertion. Although this station has been in operation only a short while and the effects of any permanent set have not been manifested, the installation at present so effectively isolates the machine that no vibration can be felt with the hand at any point of the floor surrounding the sets.

A number of methods used by the Los Angeles Railway were described. These have already been treated in ELECTRIC RAILWAY JOURNAL, issue of April 26, 1924, page 645.

The committee believes that additional information should be disseminated on noiseless operation of substations as the art develops.

It is recommended: (1) that the subject be reassigned to the ensuing commmittee for further study; (2) that if possible during the coming year some actual ventilation tests be made and the results presented by the committee; (3) that the co-operative arrangement established this year with the American Society of Heating and Ventilating Engineers be continued next year, so that the committee may have the benefit of the counsel and advice of expert ventilation engineers in its studies and tests.

REVIEW OF EXISTING STANDARDS

Manual Section G100-23 (formerly Gbla)—*Specifications for Boiler Tubes.* The committee proposes certain revisions in this specification in order that it may be in complete conformity with the A. S. T. M. specification for this class of material as revised at the 1924 convention of that Association.

It is recommended that the proposed revisions be adopted.

Manual Section G200-15 (formerly Gb2a)—*Specifications and contract for purchase of fuel.*

This specification has been reviewed.

It is recommended that it either be revised during the coming year to conform with present day conditions, or it be omitted from the Manual. It is thought, however, that the specification as it now appears should be retained for whatever value it may present until definite action is taken.

Manual Section G1-16 (formerly Gb3a)—*A. S. M. E. Boiler Code.*

In 1916 A. E. R. E. A. adopted as a standard specification the Boiler Code of the A. S. M. E. The Code was revised in 1918 by the A. S. M. E. The committee recommends that a footnote be placed on Manual Section G1-16 approving that revision.

Manual Section G200-21 (formerly Gm1a)—*Form of contract for purchase or sale of power.* The present form of contract was reviewed and no changes suggested at this time.

The report was signed by C. E. Bennet, F. C. Chambers, H. E. Davis, H. W. Codding, F. C. Hanker, G. H. Kelsay, H. A. Kidder, N. R. Love, F. W. Peters, G. W. Saathoff, T. H. Schoepf, A. E. Stierly, L. J. Turley, R. L. Weber, E. H. Schofield, sponsor, W. E. Bryan, vice-chairman and L. D. Bale, chairman.

In discussing the report Adrian Hughes, Jr., United Railways & Electric Company of Baltimore, called attention to the value of supervisory indication. C. H. Jones, Chicago Rapid Transit Company, also spoke on the value of supervisory indication and said that small wires were the first to give trouble in storms and that more reliable service would result if the number of control wires were reduced.

C. A. Butcher said that an automatic substation had been placed in service in Indiana which was using radio carrier current for its control, and so needed no control wires. Operation at this station is being watched with interest.

W. E. Bryan, United Railways of St. Louis, described the construction of his company's automatic stations and the precautions taken to reduce noise and to provide satisfactory ventilation. The forced ventilation which is used has proved very satisfactory and has warranted the additional cost involved.

L. J. Turley, Los Angeles Railway, described the construction of the ventilation system used in the substations of his company. The maximum difference in the temperature of the incoming and outgoing air is never more than 15 deg., even with extreme weather conditions. His company has gone to considerable expense to provide attractive exteriors, so as to make unobjectionable the location of substations in residence districts. Hollow tile with felt lining is used in the construction of the buildings. The doors also are felt lined and constructed on the same principle as doors used in ice boxes.

Adrian Hughes, Jr., said that his company had experimented with cork lining and had provided an air space under the floor. Air is exhausted through the roof. The maximum temperature difference between incoming and outgoing air has been 14 deg.

Pierre Bloomers, of H. H. Robertson Company spoke of the advantages of having incoming air enter through the cellar. He also called attention to the need of care in locating I-beams so as not to interfere with the proper circulation of air. He said that with proper consideration of this detail, I-beams could be located so as to assist materially in directing the air along advantageous paths.

Prof. W. Trinks of the Carnegie Institute of Technology said that the proper placing of ventilators upon the roofs of substations has an important effect upon the efficiency of ventilation. With ventilators placed in calm locations their efficiency is greatly reduced. Mr. Jones asked whether the manufacturers had considered the adaptation of a fan of rotary construction, thereby forcing circulation rather than have the rotor merely act as a churn. Replying Mr. Butcher said that a fan would prove uneconomical as it would have to overcome duct friction. Placing auxiliary fans to take care of ventilation was far more efficient and economical and he believed would prove more satisfactory.

As to elimination of noise in substation operation, Mr. Peters said that every company should be in a position to meet the condition when it arises. Quiet machines were considered by him desirable to eliminate noise. C. R. Harte stated that continuous low-pitched noise is apt to be serious as it is considerably more irritating than intermittent loud noises. He suggested that manufacturers look seriously the self-ventilated converter. That the converter determines largely the arrangement and type of ventilation employed was brought out by L. D. Bale. The use of forced or natural ventilation is determined by the location of the substation.

The report of the power transmission and distribution committee was read by C. H. Jones, electrical engineer Chicago Rapid Transit Company.

Power Transmission and Distribution

The work of the committee this year was divided up among 11 subjects, nearly all of which represent continuing investigations.

Subject No. 1—*Concrete Pole Design and Maintenance.*—Recognizing the increasing scarcity of timber suitable for poles and believing that suitable substitutes should be developed, the committee has revised the specification for the manufacture of concrete poles and it is recommended that it be substituted for the one now appearing in Manual Section D202-16.

The sub-committee has done considerable work in checking the formulas and tables pertaining to concrete poles in section D202-16, but has not been able to complete the work. It is recommended that the subject be continued next year so that the text portion as well can be put into final form to replace the present Manual section.

Subject No. 2—*Dimensions of Approach Ears or Flexible Tips* —The subcommittee finds, (1) that the bolted type of approach ear is being superseded by other special designs of fewer separate parts, capable of being more quickly attached and replaced, and (2) that it would be necessary to redesign the special castings to which it is attached in order to standardize the bolted type. It is recommended that further study of the subject be discontinued.

Subject No. 3—*Dimensions of Various Types of Trough Suspensions.*—The sub-committee has been able to arrive at standard ruling dimensions for three types of trough suspensions. This will make it possible to interchange suspensions of a given type, furnished by different manufacturers. It is recommended that the designs shown in the illustration be adopted as standard.

Subject No. 4—*Review Work of the 1923 Committee on Catenary Overhead Construction, for Other Than Steam Railroad Electrification,* and Subject No. 5—*Specifications for Catenary Suspension Materials.*—Sub-committee No. 4 has done considerable work reviewing the work of the 1923 committee and, in general, concurs in the work of that committee. Considerable study has been devoted to inclined catenary or displaced messenger construction, but there was not sufficient time to carry out certain experimental checks of results obtained by calculation for this type of construction. The committee, therefore, is not ready to report on the results of this study, but recommends that this subject be assigned to next year's committee for completion. It is also recommended that next year's committee be instructed to rearrange the report of the 1923 committee so as to put it in the form of a definite construction specification for catenary construction, using 150 ft. pole spacing. The general information on catenary construction calculation should be included as an appendix to the specification.

Sub-committee No. 5 has devoted considerable time to working up catenary material specifications, but has not been able to bring them up to the point where they are ready to be submitted to the association. It also seems desirable to prepare a definite construction specification and work up the material specifications to go along with it in order to be sure that there will be no conflict between them. The committee recommends that the cantenary material specification work be carried along and completed next year.

Subject No. 6—*Trolley Wire Wear and Composition.*—(a) Continue the study of the composition and the wear of trolley wires; (b) continue the study of trolley wire breaks from causes other than wear; (c) continue the study of various devices for trolley contacts and the effect upon trolley wire. This subject is to be studied in co-operation with the committee on equipment.

The present report represents the fourth successive year of study of the general subject of the study of trolley wire wear and composition. On some points there is very little to show in the way of definite conclusions. The reason for this is partly the difficulty of accumulating data from a sufficient number of representative sources with regularity, and in standard form for study by the committee. Furthermore, a study of this sort necessarily proceeds slowly. A definite method of procedure for the collection of this data has now been agreed upon and it is hoped that the co-operation of a large number of companies can be obtained so as to permit satisfactory and conclusive results.

It is not expected that this can be accomplished in a single year even now, for the subject is quite extensive. The point has been reached where definite recommendations can be made for this purpose and it is expected that several years will be required before sufficient data can be obtained. The requirement is for definite and positive data as to the actual wear of various kinds of wire in terms of car movements and then probably a classification of this data with regard to the operating conditions.

From data so far collected and studied definite conclusions can be drawn on certain methods known to give good results in the use of trolley wire.

A specification such as that contained in the Engineering Manual, D2-23, is absolutely necessary in the purchase of trolley wire. The specification should show the requirements for the finished product and if these requirements are met the actual composition of the wire and the methods of manufacture may be safely left to the manufacturer.

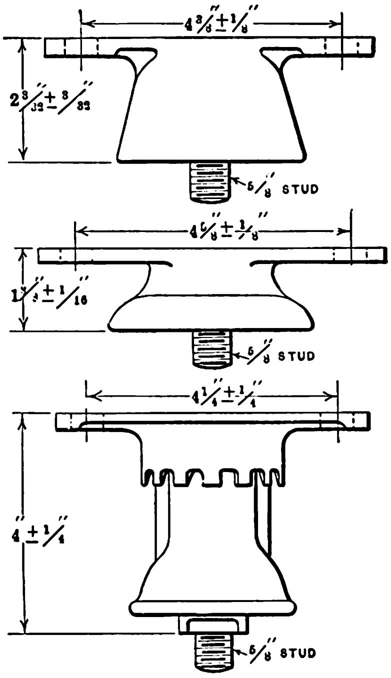
A factory inspection of each trolley wire order is advisable, or if this is impracticable, then the factory should be required to furnish certified copies of tests. It is, therefore, preferable to purchase trolley wire in as large quantities as possible, both for convenience and economy in inspecting, and also because frequently a better price can be obtained in this way.

The wire must be carefully handled during installation so as to avoid bruising, kinking or nicking. It should be pulled to a uniform, definite tension. The actual tension will depend upon the temperature at the time it is installed and the kind of wire; that is, whether it is hard drawn copper wire or alloy wire. This tension can be measured by means of a dynamometer or probably with sufficient accuracy by making pulls of definite lengths of wire with a certain number of men on a particular arrangement of rigging. It can be stated in general that the wire should be pulled tight, which means a pull of at least one-fourth the breaking strength of the wire. (See Manual, Section D101-16, par. 802.)

The supports should be as flexible as possible. Span wires should have a sag of at least 2½ ft. in 50 ft. for double-track construction. (See Manual, Section D101-16, par 702.) Where it is necessary to fasten the supports to rigid structures, as under bridges or elevated structures, some sort of a spring hanger will usually give better results than a rigid support.

The type and design of ear is important. An ear with thick lips, which entirely surrounds the wire, seems to be most desirable. It must also be carefully tapered at each end, not only on the bottom but on the sides, so as to give a smooth run on and run off.

Special mention must be made of the renewal of ears. No matter what size, shape or type of ear is used it is most important that the ear should be renewed as soon as the metal in the lips underneath the trolley wire has become worn away. Otherwise the trolley wire will rapidly wear out immediately under the boss of the ear. Frequently trolley wire has to be renewed because it is entirely gone under the ears whereas between spans it is good for several years more service. This condition can and should be prevented. It will be found cheaper to renew ears with greater frequency than is often the practice rather than to renew entire stretches of trolley wire. The renewal of ears should be put on the same basis as the renewal of trolley wire, that is, when the ears are worn out on any line, section or division, all ears should be renewed at one time. Any trolley wire should outlast four or five sets of ears. The length of life of ears on any particular line, or portion of a line where traffic conditions vary, can easily be determined from practice. In congested districts, the heavy lip type of ear which entirely surrounds the wire will last for 2 or 3 months. These ears will last for from 70,000 to 100 000 car movements.



Proposed Standard Trough Suspensions for Deep, Shallow and Insulated Bolt Hangers

Regular and careful inspection of the wire and fittings is also necessary. On several large properties, the emergency crews are made responsible for certain definite districts and they take care of both the inspection and the renewal of defective material. On another large property satisfactory results are obtained by the use of four special men as inspectors, to each of whom is assigned approximately one-fourth of the system, equivalent to a little over 100 miles of single track. The inspection is made on foot, and reports are turned in for the attention of the emergency crews who act as maintenance crews during the off-peak hours. In this way an inspection is made of every portion of the system once in 2 or 3 weeks, special attention being given to the congested districts and points of heavy wear.

The committee requests that member companies obtain and compile certain trolley wire data in a uniform manner and send copies of reports to association headquarters periodically. This data has been carefully confined to only that which can be readily obtained without great trouble or expense and which every company should have for its own information.

Many companies undoubtedly collect and record such data at present, possibly in more elaborate form than that which is here requested. It will be quite evident, however, that unless this data is reported in a uniform manner, it is difficult for the committee to make use of it. Member companies should not object to the slight changes that may be necessary to conform to the proposed methods. The suggested forms are printed in full in the committee's report.

These data include: (1) A record of trolley wire, including date of erection of wire, location, length, size and shape of wire, composition, maker's name and specifications, reel number and order number, type of ear. (2) A summary of the record of trolley breaks. (3) Periodic measurements of trolley wire in service. These measurements should be taken for any stretch of wire at a sufficient number of locations to insure obtaining an average condition. They can be taken with a micrometer, but a method which gives the actual area or weight of the wire is much better.

If a sufficient number of companies can be prevailed upon to furnish the above information it will unquestionably be possible for the committee to make some valuable recommendations regarding use of trolley wire. It will take time to accumulate sufficient data, at least 2 or 3 years, to permit drawing definite conclusions and will require the active co-operation of member companies.

It was suggested by the committee last year that a research engineer be employed to work under the direction of and report to the committee on power transmission and distribution for the purpose of making a more comprehensive and uninterrupted study of the performance and wear of trolley wire. The committee has, however, decided to postpone action on this matter for the time being, but there is no question that a very large saving could be brought about in this way.

CO-OPERATION ON CURRENT COLLECTORS

A considerable amount of thought and discussion was given to the necessity of effecting close co-operation between the committee on power transmission and distribution and the committee on equipment for the study of current collection and current collectors. There is a close relationship between trolley wire wear and the collection of current. In fact, the type and condition of the current collector is very much more important in connection with the trolley wire than it is in connection with the car itself. Ordinarily, trolley wire wear is caused primarily by the collection of current rather than by the friction between the wire and the current collector. This ratio is, from actual experience, known to be more than 10 to 1; that is, trolley wire wears away more than 10 times as fast due to the collection of current, than it does from the friction of the collector. When the collection of current wears away the trolley wire more than 10 times as fast as the mere passing of the collector over the wire, the effect of an arcing wheel can readily be appreciated.

A consideration of the relation between the annual costs for trolley wire renewals and maintenance and the annual costs for collectors will show the importance of considering the collector from the standpoint of the effect on the trolley wire. On one large property the annual cost of trolley wire maintenance and renewals is approximately $100,000 and the annual cost for trolley wheels $5,000. The fallacy of trying to increase mileage on trolley wheels at the expense of trolley wire is quite evident from these figures. A saving of 10 per cent on the trolley wire would pay the annual trolley wheel cost twice over.

At the first meeting of the committee in December, 1923, a request was made for a joint meeting between the sub-committee on trolley wire wear and the sub committee on current collectors of the committee on equipment. Two meetings were held during the year and arrangements were made to secure information. On the whole, excellent co-operation was obtained by these joint meetings. The relation between trolley wire wear and current collectors is so close and the subjects so important that it might be desirable to have a special committee consider this subject alone.

STANDARD SPECIFICATION FOR TROLLEY WIRE

In the preparation of a standard specification for trolley wire, the committee has endeavored to bring about an agreement with the A. S. T. M. so that there will be no obstacles to the acceptance of such a specification by the A. E. S. C. It is recommended that (1) The study of trolley wire wear be continued including the causes of wear and failure, using the program and methods suggested in this report; (2) a table be prepared giving the tension at which various sizes and kinds of trolley wire should be installed at certain temperatures; (3) a specification be prepared jointly with the A. S. T. M. for alloy trolley wires; (4) co-operation with the equipment committee in the study of current collectors be continued.

Subject No. 7—*Temporary Connections to Trolley Wire.*—The subject of temporary connections to trolley wire was continued from last year. Inquiries sent to a number of power distribution men indicate that last year's report has caused closer attention to be given to injury to trolley wire from inadequate connections. To determine the damage that such connections cause to trolley wire, V. S. Allen, a senior in electrical engineering at Purdue University, conducted a series of tests that will point out the damage that an inadequate connection will cause to trolley wire.

The results indicated that the hook type of contact should be satisfactory for apparatus requiring small currents up to 40 or 50 amp., provided they have a contact surface along the wire of at least 1½ in. and are made of brass, bronze or similar metal.

It will be noted that the above tests were made with a generator voltage of 115 volts and that the current values ran up to only 130 amp. In street railway practice, where 600 volts is used and where the current values run as high as 250 to 300 amp. for certain classes of equipment, we would expect that the damage to the trolley wire would be considerably greater than found in these tests.

The tests indicate that the contactor made of bronze fingers is the only one entirely satisfactory for the vlotage and current values used in this test, and corroborates the recommendation in the 1923 report of the committee on power distribution that some of the heavier types of contactors, which are shown in that report, should be used for apparatus requiring over, say, 40 or 50 amp.

It is felt that with the information as to types of contactors available, as was shown in last year's report, and the data heretofore shown on the damage than can be done to trolley wire by inadequate connections, this subject has presented sufficient data to power distribution men so that they can safeguard their lines from this source of trouble.

It is recommended that the subject be reassigned to next year's committee with instructions to prepare a section for the Manual on a recommended practice for making temporary connections to trolley wire.

Subject No. 8—*Overhead Construction for Trackless Trolleys.*—There have been no new developments during the past year on this class of overhead line. The sub-committee recommends that this subject be continued for the next year.

Subjects No. 9 and 10—*Review the Existing Sections of the Manual.*—All of the existing sections of the Manual were carefully reviewed during the year 1923 so that there was no revision necessary, except in co-operation with the manual committee during the year. It is recommended that next year's committee review existing sections of the Manual and keep it up to date.

The committee recommends that the subject of signal standards be assigned to next year's committee for study and report.

Subject No. 11—*Inductive Co-ordination.*—This committee was organized in order to keep the power transmission and distribution committee in touch with the work of the American committee on inductive co-ordination and to furnish to our representatives on that committee such data as they may require from time to time.

The American committee was organized during the year but did not begin to function actively; therefore, no work has been required of the subcommittee. It is recommended that the subject be assigned to next year's committee so that information may be furnished when called for.

The report was signed by J. Walter Allen, R. L. Allen, S. H. Anderson, S. M. Day, Leslie E. Delf. James H. Drew, Ralph W. Eaton. D. D. Ewing, Charles Gilman, H. W. Griffin, C. L. Hancock, H. D. Hawks, C. J. Hixson, Adrian Hughes, Jr., John Leisenring, H. S. Murphy, Carl P. Nachod, J. F. Neild, H. A. Pharo, W. J. Quinn, W. Schaake, A. Schlesinger, J. M. Waldron, F. J. White, G. I. Wright, M. B. Rosevear, sponsor; Frank McVittie, vice-chairman, and C. H. Jones, chairman.

DISCUSSION ON POWER DISTRIBUTION

H. H. George emphasized the appeal that the committee has made to member companies to co-operate by sending in data and information requested, so that it can furnish to the industry comprehensive recommendations of preferred practices. Mr. Rosevear called the convention's attention to the excellent work performed, which indicated that although few definite recommendations were included this year, they probably would be ready to present next year. The report was accepted as read.

W. E. Bryan, superintendent of power United Railways of St. Louis, read the report of the special committee on automatic substations. He called attention to the curves presented in the appendix, explaining their use and the difficulty in grouping and interpolation which the committee experienced in drawing them.

Economics of Automatic Substations

The committee last year submitted a report outlining two separate methods of dealing with the subject. The first method was of an analytical nature, while the second method was an elaboration of what might be termed the practical, or "cut and try," method used by previous committees.

The "cut and try" method has been adequately covered in the report of last year. The analytical method is especially applicable to the study of large areas, for the reason that once the tables and graphs have been worked out for any particular problem, a number of solutions covering districts of various load densities are immediately available. The method, which is chiefly the work of E. H. Scofield, represents quite an advance over that presented in last year's report, although the possibilities of this form of study have not, by any means, been exhausted.

The comparison and conclusions outlined may be applied to any specific problem by a simple reference to the load demand and density of distribution (or average distance of feed) provided that the foundation data, costs and operating restrictions are applicable to the particular locality.

The costs to be considered are subdivided into conversion costs, which are dependent upon the capacity and character of equipment in the station, and distribution costs, which are dependent upon and directly proportional to the average distance of feed.

Average Distance of Feed.—Since distribution feeders ordinarily follow existing streets, which in general cross at right angles, the average length of feeder to supply a rectangular area of uniform density, from a station located at the center of the area, is one-fourth the sum of the two sides of the rectangle. For a square, the average is one-half the length of a side.

In a study of a large area of non-uniform load density, it is necessary first to divide the area into smaller areas, each having a comparatively uniform load density. These areas can then be divided into smaller areas, the size of which will depend upon the capacity of the stations by which they are to be fed. The average feeding distance for areas of the same size, fed by stations located at the centers, varies to some extent with the shape of the area. It is evident, then, that the distribution cost (being dependent upon the average feeding distance) must be less for areas of certain shapes than for areas of other shapes.

Tables were included showing costs for various schemes of operation and grouping of units, as follows: (1) One-unit stations, all stations operating 24 hours per day; (2) one-unit stations, only half of the stations operating on light load; (3) two-unit stations; (4) three-unit stations. Under each plan of operation listed above costs are shown for units ranging in size from 500 kw. to 4,000 kw.

The tables list the various items necessary to the determination of annual station cost, and annual distribution cost for an average distance of feed of 1,000 ft.

To provide a ready means of making comparisons for areas of the same load density, a chart has been prepared from the data in the tables. This chart shows total conversion and distribution cost plotted against average feeding distance and also against area, since there is a definite relationship between the two latter factors. Six separate groups of curves illustrate costs for six different values of load density, and in each group are four curves corresponding to the four methods of station operation assumed.

The committee had expected to present, as part of the present report, the results of its studies on the question of loss factor. It had also expected to elaborate on what has been presented above, as to the effect of load areas of various shapes, station patterns, etc. The study of these subjects has not, however, been concluded. Furthermore, in view of the increasing use of automatic stations, new considerations of an economic nature will undoubtedly present themselves as new problems are encountered. For these reasons the committee recommends that this subject be continued for at least another year.

The report was signed by L. D. Bale, C. A. Butcher, Adrian Hughes, Jr., F. W. Peters, R. H. Rice, E. H. Scofield, sponsor; C. H. Jones, vice-chairman, and W. E. Bryan, chairman.

As a member of the committee and the one directly responsible for the continuance of the subject last year, Ralph H. Rice, board of supervising engineers Chicago traction, opened the discussion. He explained that the committee was endeavoring to obtain a general analytical solution or equation by which it would be possible to determine the economical size, number of units, and location of substations. He stated that the various fixed and operating charges had been incorporated into an equation in such a manner that would lend itself readily to different problems.

J. F. Neild, electrical superintendent Toronto Transportation Commission, expressed his interest in the yardstick idea formulated by the committee. By this means a cost figure could be obtained so that the exact amount of money needed for a project could be appropriated. The report was accepted.

The report of the committee on purchases and stores was presented by Jackson P. Dick, assistant to vice-president Georgia Railway & Power Company. As this report is included in the account of the purchases and stores meeting held on Tuesday, October 7, it will not be repeated here.

Action by the standards committee on certain recommendations is included in the abstracted report of that committee. Mr. Dick explained the advantages of the independent meetings and urged that the engineering association would continue to allow this.

Charles R. Harte construction engineer the Connecticut Company, read the report of the committee on resolutions, an abstract of which follows:

Resolutions

The committee on resolutions expressed the thanks of the association to President Johnson, Secretary Welsh, Special Engineer Hecker and to the standing and special committees for the service which has made possible the excellence of this year's meeting. The work of the manufacturers was commended for providing exhibits illustrative of engineering developments in the electric railway field and in the bus transportation field that far exceed in number and quality anything ever before attempted.

The thanks of the association were expressed to the committee on foreign operations and especially to President Johnson for the excellent work accomplished. While the findings of that committee's report indicate that in material progress the electric railway industry in America is, generally speaking, superior to that in European countries, this should not prevent us from appreciating the practices in which those countries excel.

The displays of the association illustrating the applications of its standards to current practice were commended, as were the efforts of the headquarters staff, and the member companies and manufacturers which furnished material for display.

The untiring efforts of Mr. Hecker and others at headquarters during the absence of Secretary Welsh as a member of the committee on foreign operation were commended.

The appreciation of the work of the committee on Engineering Manual in revising the Manual was expressed, and it was stated that much credit was due Mr. Hecker for his part in preparing the material.

While the work of the committee on welded rail joints has not proceeded as rapidly as had been anticipated, appreciation of the assistance of members in furthering the progress of this work was expressed.

A resolution of regret was expressed for the death of Past-President E. W. Olds, one of the organizers of the Engineering Association, who died during the year, and the secretary was instructed to send a copy of the resolution to his family.

The report was signed by Morris Buck, Daniel Durie and Charles Rufus Harte, chairman.

Nominations were read by H. H. George. The following officers were then elected unanimously:

President, C. H. Clark; first vice-president, R. C. Cram; second vice-president, C. R. Harte; third vice-president, Daniel Durie; secretary-treasurer, J. W. Welsh. Executive Committee: The above officers and R. H. Dalgleish, E. H. Scofield, M. B. Rosevear and F. H. Miller.

After all of the officers had been conducted to the platform, past-president H. H. Adams, spoke of the good work of president-elect C. H. Clark. Retiring President H. A. Johnson expressed his appreciation of the co-operation manifested by the association during the past year and urged the members to continue the good work under the leadership of Mr. Clark. Replying, Mr. Clark said:

"Our retiring president, Mr. Johnson, has certainly set a high mark for me to reach as his successor. Each and every year we think that we are nearing perfection in the engineering division and yet we still find that there are a great many improvements to be made, standards to make and modify as the study goes along. A good executive will divide his work among his cabinet, and each member of the cabinet according to his training will assign his allotment to others. Our Mr. Johnson planned accordingly and I see no reason to make any changes in his policy. We have some excellent men in our association, in fact the brains of the country in street railway engineering are here. It will be my duty to try to get them to co-operate and show the rest of the industry how to do it right, economically and quickly. I wish I could impress all managers with the wisdom of sending their engineers to these conventions. The expense is small compared with the value of the knowledge they may acquire by coming in contact with other engineers and exchanging ideas. Our retiring president has had the best of support from this body and I trust that the incoming adminstration will be treated likewise. 'In union there is strength.'"

Brief addresses were made by the other elected officers and executive committee members. Presentation of the past-president's badge to Mr. Johnson by President Clark preceded the motion to adjourn.

The committee on subjects of the Engineering Association prepared a report covering the proposed subjects for next year. This was printed in advance and sent to the membership of the Engineering Association. It will be acted upon at the first meeting of the newly elected executive committee. An abstract follows:

Subjects

The work of the committee on Engineering Manual has shown the definite need for a more thorough yearly review by the several committees of existing standards, recommendations and miscellaneous practices than has heretofore been obtained. If we are to maintain a high standing as a careful, thorough, progressive engineering body, we cannot afford to let our standardization work deteriorate through failure to keep even with current practices and the progress in the electric railway engineering field.

In order that the several committees may be impressed with its importance, your committee has placed the subject of "Review of Existing Standards" as the first subject assigned to each committee.

It is believed that a careful study should be made of the causes which have led to delayed or improperly prepared reports with the view toward changes, if necessary, in rules and regulations governing the preparation and submission of reports, which will tend to overcome these difficulties. In this connection, the suggestion has been made that the chairman of the several committees be requested to attend a meeting of the executive committee to be held either during the convention or within a very short period thereafter, at which meeting the methods of preparing reports and conducting effective committee work may be discussed. Such a meeting should result in a better understanding of these important factors in committee work.

The attention of the committee was called to the apparent need for the formation of a correlating committee somewhat on the order of a committee of like title in the American Engineering Standards Committee. The duty of such a committee would be to coordinate the work of our association with that of other bodies in order to minimize duplication of effort in the study of subjects wherein there is a joint interest.

The specific report on the proposed assignment of subjects for the 1925 committees follows as an appendix.

The report was signed by Morris Buck, R. H. Dalgleish, Daniel Durie, Charles R. Harte, R. C. Cram, chairman.

PROPOSED SUBJECT ASSIGNMENTS FOR 1925 COMMITTEES

Automatic Substations.—It was recommended that the committee be continued and directed to elaborate upon its 1924 report in connection with matters of loss factor, effect of varying shapes of load areas, station patterns and new features of an economic nature.

Buildings and Structures.—The following subjects were recommended: (1) Review of existing standards and recommendations; (2) continue study of design of buildings for proper maintenance and storage of buses; (3) design of terminals for bus operation; (4) carhouse and car shop standards. Co-operate with C. F. P. A. committee on carhouses and car shop standards.

Carhouse and Car Wiring Rules of the National Electrical Code.—It was recommended that this committee continue work in co-operation with the N. F. P. A.

Engineering-Accounting.—It was recommended that the subject of "Further Subdivision of A. C. C. Accounts to Include Equipment and Other Accounts Not Now Subdivided" be assigned to the joint committee on engineering-accounting.

Engineering Symbols.—It was recommended that the special committee on engineering symbols be continued.

Equipment.—The following subjects were recommended: (1) Review of existing standards and recommendations; (2) study design of hand-brake equipment with foundation brake rigging with view toward standardization; (3) study methods of car painting; (4) motor coach design problem. Consider motor coach standardization in co-operation with Society of Automotive Engineers; (5) devices for trolley contact. Co-operate with committee on power distribution and transmission.

Power Generation and Conversion.—The following subjects were recommended: (1) Revision of existing standards and recommendations; (2) continue study of uniform methods for recording failures of power apparatus and interruptions to service originating within the generator or substation; (3) continue study of existing practices in design and operation of automatic substations, including subjects of remote supervisory control; (4) ventilation of and reduction of noise in operation of automatic substation; (5) prepare specifications for high tensile strength bolts for use on superheated steam pipe lines.

Heavy Electric Traction.—It was recommended that the following subjects be reassigned: (1) Review of existing standards; (2) revise and publish the bibliography on heavy electric traction and electrification data; (3) collect data on (a) branch line electrification, (b) self-propelled cars, and storage-battery locomotives for yard work.

Power Transmission and Distribution.—The following subjects were recommended: (1) review existing standards and recommendations, including the sections on block signals and on concrete pole design; (2) prepare specifications, (a) for catenary overhead construction, (b) for materials used in catenary overhead construction; (3) trolley wire wear and composition—(a) study composition and wear, (b) study causes of breakage other than wear, (c) devices for trolley contact and their effect on trolley wire; (4) devices for temporary connections to trolley wire; (5) overhead construction for trackless trolleys; (6) inductive co-ordination; (7) the return circuit, including track bonding; (8) study of uniform methods for recording failures of power apparatus and interruptions to service originating in the transmission and distribution system.

Purchases and Stores.—The following subjects were recommended: (1) review of existing standards, recommendations and miscellaneous methods and practices; (2) present information and study as to economies to be gained through centralization of stores in central service building; (3) standardization of forms used and routine methods to be followed in the purchasing department and stores department. Also recommend method for handling of freight and express bills; (4) co-ordination of materials and supplies with the operating budget.

Proposed Committee on Rail Corrugation.—The committee on subjects recommended that a special committee of perhaps five members be raised to study and report on the subject of rail corrugation, to be known as the committee on rail corrugation.

Unification of Car Design.—It was recommended that this committee be continued.

Way Matters.—The following subjects were recommended: (1) Review of existing standards; (2) standardization of frogs, tongue switches and hard centers for special trackwork; (3) investigation of all forms of welded rail joints in co-operation with the committee on welded rail joints; (4) surface hardening of rails at the mill and in the street; (5) design and specifications for electric over steam railroad crossings; (6) report on arc welding processes for repairs to rails and manganese steel; (7) design of substitute ties.

Wood Preservation.—The following subjects were recommended: (1) Review of existing standards; (2) specifications for open tank treatment of wood poles; (3) specifications for brush treatment of wooden poles; (4) specification for pressure treatment of wooden poles; (5) report on methods of increasing life of timber by other means than application of preservatives; (6) report on other preservatives aside from creosote, carbolineum, zinc, chloride, etc., which may be used for preservation of timber; (7) prepare forms and recommend methods for keeping continuous records of performance of treated timber.

Special Committee on Air Reservoir Specifications to Co-operate with the A. S. M. E.—It was recommended that this committee be continued.

Unit Method of Voting on Standards.—The committee on subjects recommends that the present committee be discharged and that the subject be taken up within the executive committee by assignment to a sub-committee of that body.

Committee to Co-operate on Subject of Standardization with U. S. Department of Commerce.—It was recommended that the committee be continued.

The report of the committee on standards was printed in advance and distributed to the members of the Engineering Association. It was not read in full at the sessions of the convention, but Chairman Harte indicated the action of the standards committee immediately following the presentation of each recommendation of a committee requiring action of the standards committee. An abstract of those parts of the report of particular interest follows:

Standards

The report of the committee on standards, Charles R. Harte, chairman, was presented in sections after each committee report had been accepted as a whole. The recommendations of the various committees were in general approved. The action taken by the standards committee other than approval was as follows:

Buildings and Structures.—The recommendation that Figs. 6, 7 and 8 of this committee's report, together with the fundamental design data, be adopted as miscellaneous methods and practices was disapproved and the report was referred back for interpretation.

Purchases and Stores.—It was held that material submitted under the head of "Proper place for the purchasing and stores departments" for adoption as a recommended practice involved matters of policy outside the jurisdiction of the Engineering Association. The matter was referred back to the originating committee for revision of its recommendation.

Car and Carhouse Wiring. — The recommendation of this committee that the rules submitted covering car and carhouse wiring be adopted tentatively for the coming year and that the committee be continued and empowered to co-operate with the National Fire Protection Association in the preparation of final rules was approved with the understanding that the tentative rules would replace Manual section B200-23.

Equipment. — A number of miscellaneous methods and practices withdrawn in 1923 were revised by this committee. They were approved for use in the Manual with minor changes.

Approval of revised design of brake shoes, heads and keys recommended as standard for the new standard wheel contours, replacing present E1-21, was deferred pending correction of errors in the drawings.

Wood Preservation. — Discussion of proposed changes in Manual Section WP100-23 and WP101-23 disclosed that certain modifications might be desirable to clarify the situation. Action was, therefore, withheld pending action by the convention and the chairman was instructed to prepare amendments for submission on the convention floor.

Power Transmission and Distribution.—The recommendation of this committee that the designs submitted covering the ruling dimensions of three types of trough suspension be adopted as standard was modified to approval as a recommended standard, it being held that a new design should never be introduced as standard unless justified by extensive use.

The report of the standards committee was signed by H. L. Andrews, C. C. Beck, J. A. Brooks, C. H. Clark, L. C. Datz, W. G. Gove, C. G. Keen, C. S. Kimball, John Lindall, H. H. Norris, F. R. Phillips, Martin Schreiber, N. W. Storer, N. B. Trist and Charles R. Harte, chairman.

◆

Meeting on Bus Standards

A MEETING was held in Engineering Hall Monday morning of a joint committee of the equipment committee of the Engineering Association and a special committee on bus standardization of the Society of Automotive Engineers. The purpose was to see what could be done in the direction of standardizing bus design. Frank H. Miller, vice-president in charge of engineering Louisville Railway, acted as chairman. R. S. Burnett, standards manager of the Society of Automotive Engineers, was present to represent that organization, and P. V. C. See, superintendent of equipment Northern Ohio Traction & Light Company, also occupied a seat on the platform. Mr. Burnett offered a compilation of dimensions representing present practice. A preliminary study of the work undertaken by this joint committee is contained in the report this year of the equipment committee of the Engineering Association.

One purpose of taking action at this time is the interest of the Board of Public Utility Commissioners of the State of New Jersey in the matter of formulating detailed specifications for bus design. In fact, under the direction of the board, certain tentative specifications have been drafted by the officials in each city in New Jersey charged with the supervision of bus operation. These specifications were discussed at the meeting Monday morning and are to be considered by the commission at a public hearing shortly after Dec. 1.

The point was brought out at the meeting that other states had established certain minor operating requirements for motor buses and that if the New Jersey specifications were adopted they might be copied by other states. Massachusetts has conducted tests on headlights and brakes and has already issued specifications for headlights.

A joint committee will review the situation and be prepared to be represented at the forthcoming hearing of the New Jersey commission. The incoming chairman of the equipment committee of the Engineering Association and the Society of Automotive Engineers will appoint the committee.

◆

T. C. Cherry

T. C. CHERRY, the new president of the American Electric Railway Transportation & Traffic Association, is a man of wide attainments. Although he entered railway work at the bottom, so to speak, he had four years of work at Syracuse University and the Syracuse Law School. Thus equipped he became a timekeeper on construction and track work. His next job was rodman with the Syracuse Rapid Transit Company. Two years later he was made superintendent of track of that company. Still later, in 1900, Mr. Cherry went to Lorain, Ohio, as superintendent of construction of lines and served as dispatcher on the Lorain Street Railway. From August, 1901, to December, 1903, he was general manager of the company.

Later Mr. Cherry served as superintendent of the Saginaw Valley Traction, Light & Gas Company, and still later as general manager of the Ohio Central Traction Company. Subsequently he became connected with the Buffalo & Lake Erie Traction Company as general superintendent. He served with that company for three years. In 1912 he was made superintendent of the Utica & Mohawk Valley Railway, but resigned three years later to become general manager of the Schenectady traction system.

In 1915 Mr. Cherry joined Allen & Peck as general manager of the Annapolis Short Line. In 1916 he joined the Auburn & Syracuse Railroad and in the following year was appointed general manager for the receiver of the Beebe, with the exception of the Auburn & Syracuse, which remained separate. Upon the discharge of the receiver Mr. Cherry was appointed vice-president and general manager of the Rochester & Syracuse Railroad. This position he still holds. He is also president of the Auburn & Syracuse Electric Railroad, president and general manager of the Syracuse & Northern Railroad and vice-president of Peck, Shannahan & Cherry, Inc., management engineers. In 1920 Mr. Cherry was president of the New York Electric Railway Association. Mr. Cherry was born in 1876.

◆

C. H. Clark

CHARLES H. CLARK, the new president of the American Electric Railway Engineering Association, has been engineer of the Cleveland Railway since 1910. His career, particularly his early career was in many ways spectacular. Although Mr. Clark was graduated from Cornell University in 1892 he really started in to work when only twelve years old as a water boy on the West Shore Railroad. This was in 1882. Nothing seems to have daunted him. He worked and studied and studied and worked until he was graduated from high school in 1887.

Charlie Clark, as he is now familiarly known, had no idea of remaining content with that achievement. Immediately after his graduation from high school he went to work as a timekeeper for T. W. Harris, the contractor who was then building the Woodlawn and Butternut Street railway in Syracuse. In this way he was able to finance his start at Cornell. While studying there he worked through vacations for Mr. Harris in Boston and White Plains. Following his graduation from Cornell University he began his railway career in the manufacturing end of the business with William Wharton, Jr., & Company as draftsman. He was superintendent of the Grays Ferry line in Philadelphia and made numerous surveys for railway lines in and outside of that city. In 1894 he was graduated into the managerial class in charge of the electric railway between Mauch Chunk and Tamaqua, Pa. He next returned to the employ of Mr. Harris and assisted in building the railways in Scranton, Swedeland, Troy, Norristown, New York and Washington. From this work he drifted into general engineering and was engaged in the work of helping to build the Trenton Falls dam. In 1901 he returned to street railway work as chief engineer of the Utica & Mohawk Valley Railroad and remained with that company for two years. Then he went to Cleveland, but during the franchise fight there in which Tom Johnson was one of the contending factors Mr. Clark went to the International Railway, Buffalo, for a short while. In 1908 he became chief engineer of the New York & North Shore Traction Company, Mineola, of which John J. Stanley, the president president of the Cleveland Railway, was then president. Mr. Clark next filled in for two months in work at Rochester, N. Y. In 1910 he returned to the Cleveland Railway as chief engineer.

T. & T. Association Proceedings

Attention Has Been Concentrated During the Past Year on Four Subjects—Progress in Accident Prevention Is Told—Publicity Men Describe Their Methods—Bus Data Is Submitted—Traffic Congestion Is Discussed

ACCIDENT prevention and the development of new business were the topics considered both in the formal papers and discussions by the Traffic and Transportation men at the opening session on Monday, Oct. 6.

President's Address

In opening the meeting of the Transportation & Traffic Association President J. K. Punderford urged full attendance at the meetings. A suggestion of this year's executive committee which he believes will materially assist in editing reports of the several committees is that each chairman prepare a sufficient number of copies of his report so that one can be sent to each member of the executive committee and the sponsor as early as possible after July 1. This will permit each member to make such corrections or suggestions as seem advisable for consideration by the executive committee. Continuing, Mr. Punderford said in part:

The committee on accident prevention has secured a large amount of data from member companies, and is able to make some very interesting tabulations of accident statistics covering the years 1922 and 1923, showing an increase in the different types of accidents disproportionate to the increase in number of car-miles operated and the great need for earnest endeavor to improve the situation.

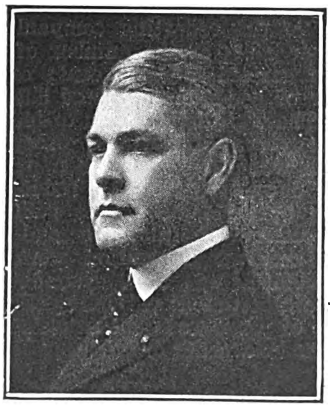
The report of the committee on development of new business indicates that the passenger traffic is still the mainstay of the electric lines.

The committee on relief of traffic congestion has dealt with what I believe to be one of the most, if not the most, important problems for municipal governments and street railways to solve. Ten years ago street congestion in the majority of our cities was not very serious, and as most street railways are not operating any more units than they did ten years ago it is obvious that the conditions have been produced by the large growth of the use of motor vehicles. When it is considered that during the rush hour, when congestion is the worst, from six to ten times the street area is taken to transport a passenger in a privately owned automobile to that taken for the conveyance of passengers in street cars, not to mention the limit to traffic flow due to the narrow streets caused by parked automobiles, it is obvious that any material relief at any practicable expense must be by regulation of the automobile. This subject affects nearly all branches of the street railway industry inasmuch as it has a direct bearing on the economics of schedules, with the incident effect on the amount of riding and the expense of operating an unnecessarily large number of cars to maintain a certain headway. The accident hazard also enters into the situation to a large degree.

J. K. Punderford
Retiring President

The committee on trackless vehicle operation has brought up to date statistical data concerning the use of trackless vehicles, with a large increase in companies furnishing data, which should be valuable to the industry.

One subject which I feel is worthy of considerable attention is that of one-man car operation. Many roads have been able to offset to a degree high wage costs, and in fact some to such an extent as to permit continued operation rather than abandonment of certain lines by one-man operation. The public as yet has not appreciated that such economies in operation are in the public interest and is rather inclined to agree with the opposition of the men to their extended use, not realizing that they must ultimately pay for any waste in operating costs which will be reflected in the rate of fare and service, and that one-man operation is one of the elements to assist in continued operation and at lower carfare than would be possible with two-man operation. Most companies are able to show that such operation has not been attended with increased personal injuries but in fact material decreases, another item of lessened wasteful expenditures in addition to the saving in platform cost.



T. C. Cherry
President-Elect

As most of us know, although the motormen and conductors have, through aldermanic committees and legislative bodies, attempted to restrict the use of one-man cars, when given an opportunity they have frequently bid in one-man car runs to obtain the four or five dollars increase in weekly wage. I believe we should use all proper methods to awaken the public and the men themselves to their personal interest in the extended use of one-man operation.

Time has been allotted to the Advertising and Publicity Section which we believe will be helpful in showing the industry what is being accomplished by this department.

I wish at this time to express my deep appreciation for the sincere and thoughtful work that has been done by members of the different committees and to express my great obligation to Secretary Welsh and his competent staff.

Secretary Welsh was called upon to read the reports of the executive committee and the secretary-treasurer. The former was read by title only as it will be published in the Proceedings, but the latter was read in full by Secretary Welsh. This disclosed many interesting facts and figures relative to the work of the association during the past year. Through the collection and study of data, the committees have developed some exceedingly valuable information which is presented in the various reports. The headquarters staff has co-operated with the committees in securing information and suggesting work for the coming year. The report also contained a suggestion that more individual memberships be taken out by the Traffic and Transportation men, for by so doing their names would be placed on the association mailing list.

The report of the committee on accident prevention was read by Charles W. Chase, president Gary Street Railway, Gary, Ind. An abstract follows:

Accident Prevention

The committee was able to better somewhat the result of the previous year in the obtaining of these statistics, 154 companies having responded to the questionnaire as against 113 in 1923; however, the comparative statistics

ACCIDENT STATISTICS OF COMPANIES REPLYING

	1920	1921	1922	1923
Cost of accidents per 10,000 car-miles operated	$148.00	$127.00	$137.24	$143.67
Cost of accidents per 100,000 passengers carried (including revenue, free and transfer passengers)	188.00	170.00	190.21	196.00
Cost of accidents, percentages of gross earnings	3.2	2.76	3.24	3.22
Average cost per accident reported	$42.20	$38.00	$37.90	$36.10
Number of accidents reported per 10,000 car-miles	3.39	3.32	3.63	3.98

shown in this report as the summary of the questionnaire include the statistics of only those companies reporting for both the years 1923 and 1922. The 154 companies reporting for 1923, or for both 1923 and 1922, represent 36.4 per cent of the electric railway mileage, 30.47 per cent of the gross receipts, and 33.5 per cent of the passengers carried in 1923 by electric railways of the United States, and can therefore be considered to represent a fair average of the experience of the industry in the matter of accidents. The questionnaire for 1923 establishes these important facts:

The percentage of gross earnings expended in cost of accidents in 1923 was 3.22 per cent, being higher than in any year since 1920.

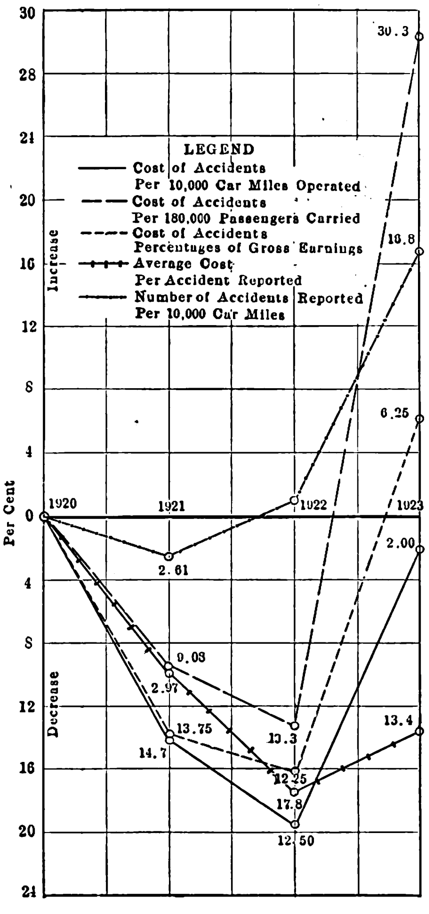
The total number of accidents of those companies reporting for 1923 and 1922 increased 13.31 per cent. Motor vehicular accidents increased 23.8 per cent. Number of car collisions increased 23.24 per cent. Number of fatalities increased 20.44 per cent.

The total cost of claims, injuries and damages, including safety work, increased 8 per cent. The number of persons injured increased 2.75 per cent. The number of passengers injured decreased 0.07 per cent. Against these outstanding increases in number of accidents and percentage of gross earnings we find an increase of gross income of the reporting companies of 8.386 per cent; of the number of passengers carried 4.6 per cent; of the number of car-miles operated 3.24 per cent. These statistics seem to indicate that in years of business prosperity such as was 1923, there is a general letting down of effort to reduce the number of accidents. This points to the necessity of intensive and persistent accident prevention work and of standardizing and systematizing such work so that it will carry through periods of prosperous operation as well as in the lean years of business depression.

The accompanying table is based on the report of the accident prevention committee for 1922 and on the reports of 147 companies in 1923. The accompanying chart shows percentages increase and decrease from the 1920 base. From the analysis it is quite apparent there is a wide field for further intensive effort in the work of accident prevention. A summary of the methods reported as being used by different companies in accident reduction work is also given.

SUMMARY OF REPLIES TO QUESTION ON METHODS

	No. of companies using method
Making employee feel responsibility for own carelessness	3
Inspiring employee with will to be careful	1
Seeing that equipment is in first class operating condition	2
Division of platform men into teams and giving a banquet at company's expense to team having lowest number of accidents in	
1 month	7
2 months	2
3 months	2
4 months	1
1,000 car-miles	1
General educational work, including periodical company safety meetings and group instruction	53
Personal work to platform men individually	13
Bonus	12
One-man safety cars	1
Accident-elimination board in trainmen's room	1
Gold stars given men who operate for 12 months without accident for which responsible	3
Stop signs on cars doors	1
Advertising	1
Merit system	2
Accident prevention placards on cars	2
Accident prevention placards on streets	1
Co-operation with local safety councils	5
Operator of car pays 10 per cent of cost of repairs to vehicles where company settles and where witnesses' statements show that company is at fault	1
Monthly safety periodical distributed to trainmen	1
Display of drawing of horse race with movable jockeys representing various departments, each jockey being moved forward or backward as the number of accidents for that department decreases or increases compared with preceding year	1
Display of National Safety Council and other safety bulletins	6
Posting of monthly accident records	1
Pin maps at all carhouses showing where accidents have occurred	1
Honor roll without bonus for trainmen without accident for which responsible for 1 month	1
Co-operation between employer and employees	1
Removal of grab handles has almost eliminated alighting, and has decreased boarding accidents	1



Yearly Fluctuations in Accidents and Their Cost

The committee believes that the greatest danger point, or at least one of the greatest which may be most easily reached, is that of motor vehicle accidents. The psychology of the situation is now right for the securing of the utmost co-operation from municipal and state authorities, the owners and drivers of motor vehicles, and the public at large. The committee therefore makes the following recommendations:

1. That a continuous and intensive campaign of accident prevention work be carried on by each member company.

2. That such accident prevention work should provide: (a) A systematic campaign to induce local and state authorities to adopt standardized rules and regulations for the control of motor vehicle traffic. (b) Keeping local authorities posted on up-to-date methods of regulation of vehicular traffic in other cities.

3. That subsequent committees on accident prevention should endeavor to promulgate a standard classification of what elements constitute the cost of accidents, so that a uniform report of such expense may be obtained from each of the reporting companies.

4. That every operating company should consider joining and co-operating with the National Safety Council in its work of safeguarding human life and property.

5. That reasonable expenditure be made by the member companies of the industry to insure the greatest possible efficiency in safety equipment.

6. It is recommended that the executive committee of the American Association appoint a committee composed of members of the affiliated associations to be known as the accident prevention committee to carry on the study of accident prevention.

The report is signed by M. W. Bridges, C. H. Evenson, James Harmon. A. W. Koehler, D. E. Parsons. R. M. Reade, S. B. Irelan, W. Phipps, A. Gaboury, C. W. Chase, chairman, and E. M. Walker, sponsor.

John J. Reynolds, claims attorney Boston Elevated Railway, presented an extended written discussion of the report, which he said was moderate yet convincing. More constructive work was needed, as industrial requirements never stand still. The influence of the automobile on accidents was shown by the speaker by means of statistics. In Massachusetts, $15,800,000 is spent annually as the result of automobile accidents. The Metropolitan Life Insurance Company has published a table of the different causes of mortality in America showing that except as to cancer every case of mortality is going down, but that all of the gains resulting from new methods of controlling diseases are offset by the ever-rising number of deaths on public highways.

At the last session of the Massachusetts Legislature a bill was introduced to establish a state fund to indemnify persons injured in automobile accidents where damages could not be obtained from the owner of the vehicle causing the injury. Stricter regulation of drivers is most important.

While electric railway men may realize the need for these reforms, they should at least take the initiative in reporting to the proper authorities the more serious automobile accidents in connection with electric railways which are due to the plain carelessness of the persons operating the machine. They can also co-operate with all means for impressing the need of safety on the public. As regards the electric railway itself, the methods mentioned by the committee are all good, especially 1, 3, 5, and 6, the others being really amplifications of the latter two. With all is the great need of a proper system of discipline, rigorously maintained at all times. In conclusion, Mr. Reynolds said, the railways must not forget that many companies are adding motor buses to their equipment and a close check should be kept on all bus accidents, and every effort should be made to eliminate them as far as possible.

An informal talk was given by Lewis E. MacBrayne, general manager Massachusetts Safety Council, upon the results of the council's meeting recently held in Louisville, Ky. He urged the delegates to stress the fact that in causing the large number of accidents automobiles are taking away the equivalent to a dividend which might have been paid to the stockholders.

A report of the committee on the development of new business was presented by F. W. Shappert, chairman. An abstract follows:

Development of New Business

Replies to a questionnaire sent out by the committee on development of new business were received from a fairly representative number of interurban lines and indicate that the industry realizes the necessity and need of a traffic or sales department. Advertising is necessary, but the real business getter is the personal touch of the traffic department with the traveling and shipping public.

The answers received to a question seem to indicate that practically all lines were now in the freight business and that much importance was being placed in its possibilities for building up revenues. The report would indicate that a majority of the lines in the Middle West are badly hit by motorbus competition on passenger traffic. A few lines have established their own bus lines in competition with their own cars; the effect, however, on the rail revenues is practically the same.

The passenger traffic is still the mainstay of the electric lines, the general average being close to 25 per cent freight, 75 per cent passenger, with a tendency toward greater increases in freight earnings. There are some exceptions. Lines between large commercial centers, or serving a district subject to tourist travel, have not felt the same slump in passenger travel, especially where advantage has been taken of the use of better equipment, faster and more accommodating schedules with a liberal support given to the soliciting department.

The committee felt that due importance was not being given to the traffic department. It is only through the traffic department that real contracts and real business are secured. The operating department must be prepared to handle this traffic with the least possible delay and it must be handled carefully to avoid damage or loss. The traffic man must be familiar with tariffs, routes and schedules and be able by his personality to secure traffic even against odds.

The following points are made covering service in the freight traffic: (a) Adequate, accessible and convenient terminals; (b) a schedule regularly maintained and adapted to the needs of the community served; (c) cars, adequate both as to number and character to suit the merchandise carried in the particular community; (d) encourage new industries to locate on right of way of electric lines; (e) arrange competitive through rates and divisions with all possible connecting lines; (f) eliminate transfer at junction points by arranging interchange of equipment, operating through cars wherever possible; (g) encourage and assist in the establishment of public relations. With this foundation, the traffic department must then, (h) become thoroughly acquainted with the customers; (i) invite all possible suggestions from the public for improvement in the service; (j) cultivate the acquaintance and the friendship of all the teamsters and truckers where possible, and eliminate to the greatest possible extent their complaints; (k) thorough co-operation between the operating and traffic departments and between the operating and other supporting departments is necessary to establish and maintain the kind of service, "To put it over."

The following suggestions are believed of value in the handling of passenger traffic: (a) Clean, comfortable, well painted passenger cars; (b) study the requirements of the property and put into effect such schedules as will supply its needs; (c) inaugurate where possible long distance travel, by operating through cars on fast limited schedules, as this is the only means of inducing long haul travel over the rails; (d) cars should be well lighted and made as inviting and cheerful as possible; (e) great care should be taken to insure reliable service and the maintenance of schedules. By these means the regular travel may be maintained without loss.

There is much extra business which may be secured if proper efforts are made along the following lines: (f) Keep in touch through the agents, newspapers, and convention guides concerning the movement of conventions, lodge meetings, church affairs, picnics and other organized movements of this kind. There is no better way to secure this traffic than a personal visit by a solicitor, even to the extent of assisting in the disposition and sale of the tickets. (g) A representative should, in movements of this kind, accompany the party, to assist in every way possible to their comfort and convenience; (h) efforts should be made to secure the movement of theatrical and vaudeville companies, in their various moves throughout the territory; (i) close working arrangements and quick communication with connecting lines in their respective territories so that advance information regarding movements of interest to both lines can be given; (j) in some cases, in order to stimulate travel, it might be well to put in low Sunday excursion rates to strictly excursion points.

The report was signed by F. L. Butler, J. A. Dewhurst, S. W. Greenland, J. P. Griffin, W. H. Harton, H. G. Monger, F. D. Norviel, C. D. Smith, O. A. Smith, Bert Weedon, M. A. Welsh, R. P. Woods, Samuel Riddle, sponsor, and F. W. Shappert, chairman.

In a prepared discussion Frank L. Butler, vice-president and general operating manager Georgia Railway & Power Company, Atlanta, Ga., observed that the committee members are unanimously of the opinion that the development of new business—of new traffic—could best be brought about by the creation of a traffic department. We are bound to admit frankly, he said, that something has got to be done to offset the losses we are sustaining by competition. The public is not generally interested in our troubles and it appears that a complete breakdown of the service is the only fact that will bring a community to the realization that it has a vital and personal interest in the success or failure of our business.

Take the Public Into Your Confidence

The company which fails to take the public into its confidence by advertising is making a mistake, according to Mr. Butler. It is not recorded, however, that even the best publicity campaign has induced the public to take an aggressive, partisan attitude in favor of any company, and all we can hope for, and all we have a right to expect, is good will, and a receptive attitude. In the past many of us have been content to tell our patrons that we were furnishing good service, and we have left them to their own conclusion as to what we meant. We have not shown them the frequency of our schedules, the speed and regularity of our cars, and the reliability of our service. Neither have we stressed the fact that practically every interest in the community is dependent upon the successful operation of our system. Personal solicitation from the traffic department is the surest method of correcting these conditions.

We no longer have a monopoly, he continued. The competition must be thoroughly understood to be met in a practical manner. We must go to the public and tell them of the low cost and other advantages of our service, and personal solicitation is far better than printer's ink.

That there are splendid possibilities in building up a freight business to offset passenger losses there is no doubt. But we must go after this business, nurse it along and take care of it when we get it. We cannot go after it today and neglect it tomorrow. In going out after this business by personal solicitation, the traffic representatives have the opportunity for creating good will, not only for that individual department, but also for other phases of the company activities.

MORE ATTRACTIVE ROLLING STOCK IS NEEDED

Discussion by various members added even more to the fund of information and constructive suggestions on the subject. W. S. Rodger, traffic manager Detroit United Lines, said that the electric railways must render a service which is superior to that of the private automobile, bus and truck, if the present traffic is to be retained and new business attracted to the lines. He said that parlor car service put on by the Detroit United has been the means of diverting traffic from rubber to rails, and described some of the steps his property is taking to co-ordinate bus and rail service. Among other things buses will be used to transport passengers from interurban terminals at the outskirts of Detroit to the center of the city.

Personal solicitation was held to be of utmost importance in getting new freight business. Experiments in the operation of motor trucks into surrounding territory as feeders to the rail lines have proved so successful that this class of service is now being extended at several points on the system.

C. D. Smith, general manager Beaver Valley Traction Company, showed that the private automobile is more serious to the lines in smaller communities than in the congested cities, due to the fact that more parking space in the smaller towns makes the use of automobiles more convenient. He urged that everything possible be done to beautify and make electric railway cars more attractive, even at the risk of overdoing it for a time. Mr. Smith also outlined the psychological effect of eliminating identification slips in connection with zone-fare collections, and stated that experience on his property had led them to believe that passengers resent the implication of dishonesty when slips are used.

In giving the Pacific Coast viewpoint of the traffic situation, O. A. Smith, passenger traffic manager Pacific Electric Railway, said that salesmanship is needed and that a traffic department is essential for taking care of both freight and passenger business. Mr. Smith illustrated this point by citing examples of results accomplished on his property in soliciting picnic and excursion traffic. He said that members of the traffic department on his property were assigned to ride on each of the divisions from day to day in order to keep in touch with the sentiment of passengers regarding the character of the service rendered, and to report any needed improvements or changes in schedules.

Knowing what the public wants, and filling that want, was cited as the only successful method of increasing traffic on electric railway lines. Mr. Smith said that his company's 65 agents formed an important part of its traffic building organization and that the representatives at various points on the lines were urged by the company to belong to business, luncheon and social organizations and to take an active part in all civic affairs in their community.

Development of new business on city lines requires application of the same principles that have been used on interurban properties, according to W. E. Wood, manager Houston Electric Company. He said that the work of traffic building should not be limited to any one department, but should be an important part of the activities of the management. The first requirement is to have the service right. Unless this is the case, publicity and solicitation will do little good and may actually be harmful.

Following the same idea, F. R. Cogswell, traffic agent Pittsburgh Railways, illustrated how merchandising methods are used to build traffic on his property. He told about the care which is taken in running down complaints, and said that in some cases this practice had made valuable friends for the company. Whenever possible, complaints are followed up by a personal call on the person sending in the letter.

An interesting honor roll plan for agents used by the Texas Electric Railway to stimulate interest in traffic building was described by J. P. Griffin, vice-president and general passenger agent of that property. He said that agents are an important factor in building new business as well as taking care of that already obtained, and suggested that such men should all be active members of the traffic department and responsible to the traffic manager.

The session was closed with a further discussion on the paper by C. E. Morgan, vice-president and general manager Brooklyn City Railroad. Mr. Morgan emphasized the importance of keeping schedules fitted to traffic requirements by frequent checks and by contact with conditions in the community served, so as to make changes when they are required.

Tuesday's Session, T. & T. Association

THE meeting of the T. & T. Association on Tuesday afternoon was called to order at 2:45 by President Punderford. He expressed his pleasure at having the publicity men present their views. The publicity man, he said, is an adjunct to the transportation department, as the business of that department is to sell rides. In the T. & T. Association publicity men will find an opportunity to sell their services to the executives and thus to boost their business.

After paying a fine compliment to Labert St. Clair for the work he has done in publicity for the association, the meeting was turned over to him by President Punderford.

Dwight Burroughs, publicity agent United Railways & Electric Company, Baltimore, Md., was the first speaker. He said that his topic, "Safety and How to Make It Interesting for Mothers and Children," was a rather difficult one. The song writers say everything nice about mother and children and then put it up to father. He said he would do his best.

Baltimore has a good safety department, he said. A number of means have been employed to reach the children. One way that has proved very successful is the use of a "safety alphabet." Each letter has a jingle made up in the form of a nursery rhyme designed to catch the attention of the child. For example:

A is for accident,
Which you may meet
If you are careless
In crossing the street.

A second means of approaching the children is by work in the schools. In Baltimore the school boards have co-operated by setting aside one day a year to be known as "Safety Day." The company also gives to the teachers a textbook which contains suggestions for interesting various classes of pupils. As an illustration, Mr. Burroughs mentioned safety "Don'ts." These have been used very effectively in the lower grades. Topics for essays are used for interesting children who are taking more advanced work. He said that as the result of these topics he had received nearly 100,000 contributions from the public and private schools in Baltimore.

A third method for interesting children used in Baltimore is the display of safety pictures at expositions and exhibits. These safety pictures were designed to show the relation between street cars and the home, one feature being safety. One topic that had been used to good advantage in these pictures was "Safety Bob" and "Safety Betty."

Another plan that he had used was the distribution of safety buttons. These have been distributed widely in the schools. The safety alphabet has also been reproduced in a folder and distributed to children. The old magic lantern in its improved form of automatic stereopticon has been used to good effect for displaying safety pictures. He believes that the use of these methods had prevented many accidents.

President Budd of the American Association addressed the meeting briefly. He regards the work of transportation and traffic men as most fundamental. This department does more than anything else for the success or failure of an electric railway since it is responsible for the service that is given—and the service is responsible for all other things. Many of the details of the service are the foundation for public relations. Following this out, it makes for or against the ability of the transportation department and of the railway to get funds. And funds are necessary to get the wherewithal to give service. In any case, many minor things can be done to give service, which determines the ability to get money.

We have to be sincere in our efforts,

said Mr. Budd, and must be imbued with the spirit of service. To be worth while, it must come from the heart and must indicate to the people you serve that you are of the right sort. Illustrating his point, he mentioned that complaints from patrons are frequently turned over to subordinates. This he felt was unfortunate as the old methods do not apply to the high pressure days of 1924. The best letter writer in the world cannot write a letter that will not be misinterpreted. Eliminating letter writing in answer to complaints and making personal calls by responsible executives is the answer. Such men can properly explain the reasons for the difficulties or why the company cannot comply with the request. In this way human contact can be established. Incidentally, said Mr. Budd, this will react on the officials who have to make many calls outside of office hours, and they will get the reaction to reduce causes for complaints. Above everything, he said, it is necessary to keep the good opinion of the public.

A paper on the subject of "Selling Transportation by Boosting Your Home Town" was read by L. K. Starr. Following this W. H. Sawyer spoke on the subject "It Can Be Done," and James P. Griffin described the methods by which his interurban railway in Texas increased passenger traffic by energetic publicity work. Abstracts of these papers appear elsewhere.

A short talk on the subject of state public service information committees was made by J. S. S. Richardson, director Pennsylvania Public Service Information Committee. Major Richardson said that when Bessemer first explained to a group of steel makers in England the method by which he proposed to make steel, he was laughed at and his remarks were expunged from the record of the meeting. A few years ago the man who advocated public utility companies undertaking publicity work received a similar reception.

People sometimes ask why a public utility should advertise when it is so largely a monopolistic enterprise. The point of view of those who ask this question is not unlike that of the owner of a general store in a small Western town. When asked by the advance agent of a circus if he did not want to advertise his merchandise by a sign to be carried on the back of one of the elephants in the circus parade, he replied that he had been in business for 25 years and every one in that town knew him. To that the agent responded:

"How long has that church been standing there on the other side of the street?"

"About 100 years," he answered.

"Don't they ring the bell every Sunday morning?" the circus man asked.

Bureaus of public utility information came into being because of the misrepresentations of demagogues and certain newspapers. It was thought that the best way to combat these elements was by the formation of an organization which would disseminate the facts. Such bureaus have now been formed in 37 states. Numerous public speaking bureaus also have been organized, and courses in public utility subjects have been arranged in various colleges. This movement is receiving ample financial support from the utility companies, but more than that is necessary. In order for it to prosper and progress, it will be necessary for it to receive more constructive criticism from the executives.

"Cold Soup" was the subject of a paper presented by John S. Bleecker. An abstract appears elsewhere.

W. P. Strandborg spoke extemporaneously, telling of the success which his company has had by using car cards in Portland, Ore. The number of people riding in the cars who see these cards every day is greater than the combined circulation of all the newspapers. Newspaper publicity, however, is very valuable for a railway, he said. It is much better for the railway publicity man to drop in and talk to the newspaper editor than to simply send over a written story and expect to get it published. But, best of all, is the method of buying space in the paper and telling the railway story exactly as the company wants it to appear. An interesting point brought out by Mr. Strandborg was that during the past 13 years, while various "truth in advertising" campaigns have been in progress, not one important violation has been charged against any electric railway.

The report of the committee on trackless vehicle operation was presented by V. E. Keenan, in the absence of W. J. Flickinger, chairman.

Trackless Vehicle Operation

The committee interpreted its function to be the collection of statistical matter concerning the use of trackless vehicles for transportation by street railways and the assembling of such data for the information of member companies. The report contains figures obtained from 34 companies operating 488 buses. It is subdivided into five groups, general information, operating methods, suggested operating rules, maintenance methods and financial statistics. The operating companies are not mentioned by name and the information is not summarized in a way that indicates definitely present tendencies in bus operation. The data compiled by the committee are presented in table below.

There seems no longer to be any doubt, according to the committee, that those who formulate the policy of street railways realize that in the bus they have a very useful ally to the rail car. No progressive railway managements will stand by and see part of their territory served by independent bus operators without making a determined effort to convince the traveling public that it is of mutual interest that all mass transportation be performed by the established agency. Having succeeded in this, as they ultimately will if they are persistent, they have available a combination of facilities with which they can give the traveling public exactly what it wants and maintain the good will of the community.

Under the head of operating methods the committee states that all but three companies from which information was obtained have found it expedient to operate the buses with the same supervisory organization as that which has jurisdiction over the railway operation. In the case of the few companies which reported separate supervisory organizations it was apparent that the general management was handled by the same general officers as the railway, but that the subordinate officers were separate and distinct. Another point brought out was that there seems to be no radical difference between the physical examination required of bus

STATISTICS OF BUS OPERATION

*Not given

drivers and that required for street railway employees. The standard form of examination blank is used by the majority of companies and covers the usual questions. In some instances employing companies require that a prospective bus operator shall have a state chauffeur's license before he will be employed.

It was felt by the committee that a suggestion for a set of rules for the guidance of bus operators would be helpful at this time. Accordingly a book containing 82 regulations designed to govern the operation of buses is presented in the report.

The report states that the general practice is to have bus maintenance supervised by the same organization which has charge of maintenance of railway cars. The committee finds, however, that because employees engaged in bus chassis maintenance require a different training from those engaged in electric car maintenance more satisfactory results will be obtained through the separation of these departments as soon as the number of bus units becomes large enough to keep a separate organization busy during a full working day. There appears to be no uniformity among the companies in their inspection practice.

The financial section of the report is confined entirely to cost figures because the local conditions govern the matter of income to such an extent that revenue figures would be of little value. The total operating expenses and taxes vary from approximately 17 cents per bus-mile up to nearly 33½ cents per bus-mile. Inasmuch as no statement of operating conditions accompanies these figures, it is practically impossible to draw any definite conclusion therefrom.

The committee finds that trackless trolleys are being operated by five railways. This type of vehicle is used to such a small extent that this phase of trackless vehicle operation is left to the consideration of future committees which will have the benefit of greater experience in its use. The fact that the number of companies operating trackless trolleys has increased by two and the number of vehicles by 15 during the past year makes it evident that places are being found where, in the judgment of the management, the trackless trolley can be operated to better advantage than the gasoline-propelled vehicle.

The report is signed by B. W. Arnold, H. F. Fritch, V. E. Keenan, D. A. Scanlon, J. B. Stewart, Jr., O. A. Smith, sponsor, and W. J. Flickinger, chairman.

In discussing this report, C. D. Cass gave details of bus operation on the Waterloo, Cedar Falls & Northern Railway. He suggested that the automotive engineers should make studies of bus design in order to prevent mistakes during the coming formative years of the industry. The scope of this committee should be enlarged, in the opinion of R. N. Graham. The fact that the committee has found the actual cost of bus operation to be nearer 24 cents a mile than 14 cents a mile is important, he said. In fact, the cost, everything considered, is likely to be somewhat higher even than that. Obsolescence must be remembered and included in the cost. Mr. Graham said that city bus operation can be successful only when the load factor is high, the haul is short, and the fare is adequate.

The short length of time which has been necessary to bring the railway and motor bus interests into a spirit of co-operation was mentioned by G. R. Dahl. In no other instance have competitive modes of transportation so quickly harmonized their points of view, he said. Attention was called by this speaker also to the fact that accidents are fewer with bus operation than with railway operation.

Standardization has no place in bus operation, according to J. S. Bleecker, except in the matter of accounting. He said that it would be a mistake to try to standardize in other directions. Especially it would be a mistake to try to tie down the bus drivers by a code of rules similar to the street railway rules of the vintage of 1906. He spoke briefly on the subject of maintenance. In closing, Mr. Bleecker said that he considered a separate corporate organization for the operation of buses to be undesirable in most cases if it is legally possible for the railway company to operate buses under its own name. The discussion of the report was closed by W. J. Locke, who said that although bus operation had heretofore in many cases been unprofitable, there was promise of better financial return in the future. He mentioned also the possibility that steam or electricity might be utilized as a means of propelling buses.

Thursday's Session, T. & T. Association

THE Thursday afternoon session was called to order by President Punderford, following an interesting exhibition of moving pictures showing the activities of the Public Service Railway of New Jersey. In introducing the subject of relief of traffic congestion Mr. Punderford called attention to the difficulty of securing action along these lines by civic bodies. Although the number of automobiles in Connecticut has increased from approximately 10,000 in 1910 to about 170,000 at present, while the number of street cars operated has remained practically the same, the general feeling of automobile clubs is that relief should be given almost 100 per cent by the railways. The report of the committee on relief of traffic congestion was read by D. L. Fennell in the absence of Chairman Paul E. Wilson.

Relief of Traffic Congestion

The committee believes that certain causes of traffic congestion are to be found everywhere throughout the country, and that these common causes of congestion will require a common method of prevention or elimination.

The streets of any city are created for the express purpose of moving the traffic growing out of the business and social intercourse incident to city life. The fact that the cities were laid out and street width determined under totally different conditions from those now existing results in streets entirely inadequate for present use. The seriousness of the problem can only be realized when we remember that there must be moving into and out of the congested district of such a city as Denver within an hour or an hour and a half in the morning and evening rush periods 30,000 to 40,000 persons on streets that will not average more than 66 ft. from building line to building line, further reduced by sidewalks to 42 ft. from curb to curb.

Some form of mass transportation on rails is inevitable if this volume of traffic is to be moved, and this necessity of rail transportation calls for a strip not less than 22 ft. wide for two car tracks with clearance in the middle of this limited street width, leaving under general conditions not more than sufficient space for a single line of moving vehicles on each side of the rail area. Long-time or limited-time parking privilege results in cutting down the width available for traffic flow, so that as a result of extensive studies we find that out of the full area of street space, cities which permit parking utilize 20 or 25 per cent of the street space for stored vehicles, approximately 75 per cent for moving automobiles, considering only the necessary clearance between vehicles, and less than 5 per cent under the same conditions for moving street cars.

The service rendered in the movement of traffic by these three divisions of street area are entirely out of proportion to the area utilized. The standing vehicles, of course, do not provide for any passenger movement. Moving automobiles carry on the average slightly less than two passengers each, while moving street cars, especially during peak hours and in the direction of peak movement, carry from 50 to 100 passengers. In other words, the 20 per cent used by standing vehicles carries no traffic, the 75 per cent occupied by moving automobiles carries from 20 to 30 per cent of the total traffic flow, and the minute 1 to 5 per cent occupied by moving street cars carries the utterly disproportionate 70 to 80 per cent of the total traffic.

In Chicago, it has been found that passenger automobiles form 51.3 per cent of the traffic volume entering the loop on a normal week day, but carry only 18.9 per cent of the passengers. Street cars form only 10 per cent of the traffic and carry 74 per cent of the passengers.

MAJOR CAUSES OF CONGESTION

While the narrow streets, resulting from the failure of city planners to foresee modern conditions, make traffic congestion, there may be recognized three primary causes of present-day congestion. The first of these is the concentration of modern business in every large population center into a relatively small area.

The second cause of the street congestion grows out of the tremendous increase in use of private vehicles. Where a few years ago such a city as

Syracuse had in its streets only 8,000 automobiles, this same city in 1923 had 40,000 automobiles. Detroit, for example, between 1922 and 1923 showed an increase of 28 per cent in the number of automobiles. Chicago last year licensed 261,254, an increase of 133 per cent since 1920. When it is remembered that in the earlier period practically the entire passenger traffic was handled in street cars carrying 50 or more passengers in the rush period and that it takes on an average more than 25 private vehicles to carry the same load, it is no wonder that the streets have reached the saturation point and have, in many cities, passed beyond this toward a condition of traffic stagnation.

The third cause is the demand of the private vehicle owner for the right to stop his vehicle in the business district while he transacts business therein for a period ranging from a few minutes to the entire day. Approximately 20 per cent of the total street area in a business district, worth as bare land not less than $25 per square foot, and graded, paved and policed by the municipality at an expense of not less than an additional $1 per square foot, is actually being utilized by less than 3 per cent of the public as a private garage.

SUGGESTED REMEDIES FOR CONGESTION

Various remedies which have been suggested for the solution of this problem of congestion fall naturally into two groups, the first of which consists of various methods of increasing the traffic area and the second of which looks to increasing the capacity of the existing traffic area. In the first group comes: (a) the opening of new streets; (b) the widening of existing streets either by moving back the building line or the widening of the street bed by the narrowing of the footways; (c) the duplication of the street width by the construction of elevated roadways or subways; (d) the elevation or the arcading of the footways, thus adding the present footway area to the vehicular street width.

There is one distinct objection to all of the remedies of this class. If the business district has already reached the limit of its business population and traffic flow, relief might be obtained by the increase of the street area, but under existing conditions, increased areas will be immediately absorbed by still further concentration of business within the congested district, so that the relief furnished by an increase of the existing facilities would be of short duration.

The second group of remedies consists of those which tend to increase the capacity of the existing street area. The ability of a main street to carry away from the congested district the business population depends solely upon two factors, the number of moving units which it can contain and the speed at which they can travel.

Speed of traffic flow demands first of all that the main arteries which ought to discharge the traffic shall have as nearly as possible an unimpeded right of way. It demands, in the second place, that, as between various types of vehicles moving in the main traffic stream, the preference shall be given to those which are furnishing the maximum of service. It means, also, that the slow moving vehicle unable to maintain the standard speed of traffic flow must ultimately be excluded from the main arteries during the relatively short period of their maximum use, and that the left-hand turn, however convenient it may be to the occasional motorist, must be eliminated where possible.

In some few cases it is possible by the development of by-pass streets which pass around the relatively small congested area to divert from this area the through traffic which would otherwise swell the traffic stream.

It is also possible in some cases, particularly on streets occupied in part by street cars, to facilitate the traffic flow by the use of one-way streets. But the one-way street is apt to concentrate upon one of two streets the outbound traffic which should be handled by both, while the other is practically empty.

It is probable that the most important means of increasing the street flow is the elimination of the standing vehicle during at least the peak-hour period. The capacity of any channel is measured by its narrowest point. To all intents and purposes a single vehicle standing in a 50-ft. street is equivalent to the destruction of from 7 to 10 ft. of street width from that point to the end of the congested area flow.

All of us who drive our own machines appreciate the inconvenience of not being allowed to stop in the congested area or anywhere else for the transaction of business. The seriousness of this situation and the importance of removing this particular form of interference with the traffic flow is emphasized by the fact that out of the 30 cities selected as typical not a single one fails to emphasize the elimination of parking during the peak hour as the most important possibility of relief. Nor is there one that has not advocated some means of protecting the flow of traffic after the taking effect of a non-storage rule.

Ideal conditions of the movement of the general public involve first a free flow of the vehicles used for mass transportation. These vehicles must stop at not less than 50 per cent of the street intersections and they must be operated at frequent intervals. The minimum headway between cars must be from 30 to 45 seconds, and any interference with the movement between stops must inevitably throw cars off schedule and result in delay which inconveniences the entire body of car users. Where driving upon the car tracks between stops and safety zones is unrestricted, the usual condition during the rush hours is that the stopping of a street car at an intersection necessitates the stopping of practically every following car for several blocks in the rear, not for the purpose of taking on or discharging passengers, but simply for a dead wait in the middle of the block. In other words, if 70 to 80 per cent of the population which is moving by the mass vehicle is to be carried in comfort and with reasonable speed, non-street car traffic must be excluded from the rail space, not only at intersections but in mid-block as well.

The private vehicle must also have a free traffic lane. In the few cases where street width is sufficient to provide for double tracks and two lines of traffic flow on each side of the tracks, it is possible to provide for this and still permit a limited amount of stopping at the curb, but even here the result is a destruction of the street width if the stop is any longer than is necessary to take on and discharge passengers, and a slowing down of the speed of the traffic line nearest the curb, where the stopping is limited to the taking on and discharging of passengers. In the large number of cases, however, the street width permits only one line of traffic flow on each side of the car tracks. Delayed street car operation means increased operating expense to the street car companies, and the congestion resulting undoubtedly increases the percentage of accidents and accident cost. But under the modern theory of regulation these extra expenses are passed on to the general public, the result of which is that the majority of the public, riding on the public utility vehicles, not only secure a less comfortable and less speedy service, but themselves pay the extra expense of their own discomfort and delay.

The committee feels that the matter of congestion of traffic on city streets is a public matter in which all citizens are vitally interested; that the only authorities capable of properly passing upon it are the public authorities; that the problem is naturally one within the jurisdiction of "planning bureaus" equipped to study the question and to present it to the citizens in a purely scientific and impartial manner. We also know that too much propaganda on the part of a street car company in any community is likely to create the impression that it is entirely a street car matter, whereas if the question is handled by impartial experts and treated on the basis of sound public policy, the street car company, from the strength of its position, is bound to be benefited by a proper solution.

To summarize, the committee finds: (1) Traffic congestion exists everywhere and is the foremost urban problem; (2) traffic congestion can be greatly relieved if not almost eliminated by regulations that will secure to the public the maximum use of existing streets; (3) these regulations must be of two kinds: first, the restriction of needed street space to moving traffic; the other, the control of moving traffic in and along main thoroughfares or arteries; (4) the problem is one for the general public, rather than any one industry affected; (5) all industries affected should co-operate with public authorities.

The appointment of a standing committee on traffic regulation by the American Association is recommended, this committee to co-operate with both industries and public for their mutual interest in the continuous study of the problem, the securing and applying of remedial measures and the education of the public in both.

The report was signed by G. B. Anderson, H. O. Butler, D. L. Fennell, M. McCants, W. H. Maltbie, James Smith, W. E. Thompson, J. V. Sullivan, sponsor; Paul E. Wilson, chairman.

J. H. Norris, chairman Board of Street Commissioners, Boston, called attention to the reduction in automobile registrations in several states, and the reduced proportional increase in others, as an indication that the saturation point in number of vehicles in use is fast being approached. He said that the first duty of all public officials having to do with traffic regulation, should be to protect the movement of vehicles used by the masses. Mr. Norris also expressed himself as being in favor of the elimination of traffic officers except in extremely congested districts, and also advocated elimination of time limit parking.

Upon invitation of the chairman, H. F. Lansdowne, traffic superintendent London General Omnibus Company, addressed the meeting briefly and discussed some phases of American conditions which have impressed him. He felt that mechanical devices for the regulation of traffic, such as the Fifth Avenue signal system in New York, needlessly interfere with the movement of traffic, and that better results would be accomplished by proper education of drivers. He expressed surprise at the parking conditions in this country. This situation, he said, called for attention on the part of those interested in the relief of congestion. A great measure of relief in London is obtained by prohibiting the delivery and collection of goods during certain hours of the day, according to Mr. Lansdowne. He also said that Lord Ashfield had decided to send a group of his operating officials to this country each year to study American methods, and at such a time that they could attend the annual convention. He suggested that a paper prepared for the occasion would serve to inform American operators of developments in England.

J. A. Stoll, superintendent of transportation United Railways & Electric Company, Baltimore, described some of the traffic conditions in that city. Elimination of left-hand turns on Market Street in San Francisco has speeded up the cars materially, according to M. McCants, general manager Market Street Railway. As for the parking situation, he said that he believed the public ultimately would come to a point where they would insist on relief and that the situation would be worked out because of such a demand from the public itself.

G. B. Anderson, manager of transportation Los Angeles Railway, objected to a policy of allowing the situation to work itself out. He said that the street railway managements and the association have the responsibility of defending the unorganized large group of people who depend on street car transportation daily to and from their work.

Discussion at the recent safety conference held in Louisville by the National Safety Council and carried on by traffic men not connected with electric railways showed a trend toward methods of traffic congestion relief which have been accepted for some time by railway men, according to J. P. Barnes, president Louisville Railway. L. H. Palmer, general manager United Railways & Electric Company, Baltimore, objected to a suggestion by the committee that this subject of congestion be considered by a standing committee of the American Association, and the association voted to refer the matter to the incoming executive committee of the Transportation & Traffic Association.

THE NEW OFFICERS

The following officers and executive committee members were elected for the ensuing year: President, T. C. Cherry, vice-president Rochester and Syracuse Railroad, Syracuse, N. Y.; first vice-president, G. H. Clifford, vice-president and manager Northern Texas Traction Company, Fort Worth, Tex.; second vice-president, J. V. Sullivan, assistant to the vice-president Chicago Surface Lines, Chicago, Ill.; third vice-president, Edward Dana, general manager Boston Elevated Railway, Boston, Mass. Executive committee members: W. H. Boyce, commercial manager Pittsburgh Railways; E. M. Walker, president Schenectady Railway; Samuel Riddle, vice-president Louisville Railway, and Paul E. Wilson, secretary Cleveland Railway.

The new elected president was escorted to the chair by Messrs. Palmer and Clifford. He expressed his appreciation of the honor conferred upon him and then presented a past-president's badge to Mr. Punderford, who responded and pointed out the live topics that are before the association for consideration next year. He asked that the new president be given the same hearty co-operation which he had received.

*It Can Be Done**

By W. H. Sawyer

President East St. Louis & Suburban Railway

Publicity Not Backed Up by Performance Is Worse than Useless—Local Newspaper Advertising Is Best Method of Reaching Public

W. H. Sawyer

IT CAN be done because it has been done. A few years ago it had not been done and there were many people who said, "It can't be done." There were others, and they too were many, who said, "It should not be done." There were even some who said, "It must not be done," but the facts are, *it has been done.* I refer, of course, to effective publicity by electric railway companies.

I pride myself that I was one of the first to insist that it should be done—that it must be done. I also pride myself that I was one of the first to say, "Now that we have proved that it can be done, let us confine our efforts to analyzing how it can be done better." There are some few electric railway executives who do not now believe in, or at least do not now practice, effective publicity.

There are also probably some electric railway executives who do not appreciate that the car riders are their customers, and that one of the chief duties of an executive is to see to it that in so far as it is practicable to do so, his customers are satisfied customers, believing in him and in his company.

There are possibly some few electric railway executives who do not appreciate that cleanliness and courteousness are most essential. There are, in short, some few electric railway executives who should have been thrown out of their executive positions about five years before they secured them. It is a waste of time to appeal to them when there are so many others who are asking for constructive suggestions and help.

It can be done! Let us review the situation as to what has been done by effective publicity, not with the idea of converting those few, who will not see or will not hear, but with the idea of instilling enthusiasm toward greater effort with rightful expectation of greater reward. Effective publicity has caused electric railway companies to be born anew, as it were, to radically and effectively change public sentiment by giving the public—our customers—the facts about their electric railway so that they might appreciate that every time they co-operate with us, every time they help us they put us in a better position to help them in return. We cannot expect co-operation except as we give our customers full and complete knowledge of the facts, take them into our confidence, and do our part toward instilling into them a just pride in their electric railway.

Publicity not backed up by performance is useless, is worse than useless. No man, no company can afford to go on record with publicity unless he gives the facts. He has no right even to promise something which he is not practically sure he can fulfill. It is far better not to use publicity than to come out with publicity which cannot be fulfilled to the very letter and to the limit of the spirit.

---

*Abstract of a paper presented before the annual convention of the American Electric Railway Transportation & Traffic Association, Atlantic City, N. J., Oct. 6-10, 1924.

Our business is capable of reasonably exact analysis, and there is little excuse for any mistakes in our publicity. Our business is above all not a business where we can afford to give false testimony, even though it may temporarily relieve a perplexing situation. Effective publicity has won strikes, has peaceably settled labor disputes, and has been the direct means of obtaining increased fares.

Local Newspapers Are the Best Advertising Medium

Personally I believe that local newspaper advertising is the best method to obtain effective publicity. No electric railway company can afford not to advertise in the local newspapers, and in fact, no business that I know of catering to a local general public can afford not to advertise in the local newspapers. We ask to be treated like other business and we therefore must conduct ourselves like other business and advertise in the local newspapers.

Advertising is a business. Our advertising department should be just as much a part of our business as is our transportation department, as is our mechanical department, as is our engineering department. Effective advertising requires training, study, thought, aptitude and initiative. Some few years ago when I first realized that advertising was essential to the electric railway business I also realized that I personally knew little about advertising, although there was no other branch of the electric railway business with which I was not familiar from actual experience.

So instead of hiring a trained advertising man I set about to train myself in at least the rudiments and essentials. The first year or two I personally wrote practically every advertisement, not because I could do the job better than anyone else, but because I believed that advertising was part of my business. Moreover, I wanted the experience so that I could form definite conclusions based on my own experience as to how effective publicity could best be secured.

How Can It Be Done Best?

How can effective publicity best be secured? As the result of our experience over the past five years, I have my own thoughts, but I am frank to admit that we just scratched the surface, as it were, of advertising knowledge and I am not qualified to tell you how effective publicity can best be accomplished. Even if I thought I were capable of doing this I should hesitate before an audience composed of so many publicity experts. When I consider how many real publicity experts there are here today it brings home forcibly the truth of my subject. It can be done. That's settled. What I want is for the publicity experts to tell us how effective publicity can *best* be accomplished.

Organizing the Public Relations Department[*]

By L. K. Starr

Manager Public Relations Department
Georgia Railway & Power Company
Atlanta, Ga.

L. K. Starr

The Director of Public Relations Should Know Human Emotions and Reactions, Must Know How to Disseminate Information and Must Be Able to Make Friends for Himself and His Company

JUST because a company is well and happy, so to speak, doesn't mean that it never is going to be seized with some serious malady. Therefore, it is probably more important that public relations activities be considered as preventive medicine rather than curative.

Good service of course is the fundamental of good public relations. If we fail to do our best to give good service we will not deserve public good will. In our business, however, good service alone, no matter how cheerfully given, will never hold good public opinion. Grudgingly given, it can never gain friendship. It thus becomes essential that, in addition to rendering good service, we must gain public understanding through the furnishing of correct information about this business. There is often as much harm done by misinformation as by failure to give service. Also it is our duty to give the facts about a business which is so affected in a public interest.

Ten to one the public relations manager knows very little about the detail and technique of operation of the street railway system any more than he knows how to audit the books, direct the building of roadways, the maintenance of equipment or the building of dams and transmission lines. You would not consider employing an auditor to build a transmission line any more than you would employ a carpenter to take out your appendix. By the same token you should never employ a man who doesn't know the business to direct your public relations activities.

There are many ways of building and maintaining good public relations and of disseminating information. There is the necessity of good service. Essential to good public relations are good employee relations, a company spirit created and maintained through inspiring leadership, plus correct information. Essential also is the use of every medium of distribution of information, such as newspaper advertising, motion pictures, employee publications, public speaking, and the like.

The director of public relations ought to be a man who knows something of human emotions and reactions; who has had experience in dealing with the variable moods of the human mind; who can win and hold the confidence of employees; who knows how to disseminate information; who has the confidence of the public and of company officials and who has sufficient personality and knowledge of the business to make friends, not merely for himself, but for the company as well.

Most companies, in the organization of public relations departments, have drawn men from the editorial or news departments of newspapers for their directors. There is a sound reason for this. The daily work of the newspaper man is to study and know the human mind and human emotions. But none of them are successful unless they know what people want and what people think and how people will react under various conditions.

Further, newspaper men are supposed to have a gift of expression in understandable language and the ability to write readable advertising copy. The ability to tell your story in understandable forms is absolutely essential to getting your story to the public. There are many brainy and gifted executives who know their business but can't tell it to the public. It's no reflection on them if they can't "talk the public's language." Let them tell it to the publicity man and leave it to him to tell the world.

So, employ some good newspaper man to direct the work. Let him be the spokesman of the company. Take him into the complete confidence of the inner councils and give him sufficient prestige in the company to command public regard as the company spokesman.

With the creation of the public relations department comes the details of organization, which of course should be left to the department manager. But it should be clearly understood that only through the public relations department is there to be any dissemination of information. This department should give out all information; should direct employee activities and contacts with the public; should advise with all departments on matters of policy and should direct and handle all advertising.

---

[*] Abstract of a paper before the Annual Convention of the American Electric Railway Transportation & Traffic Association, Atlantic City, N. J., October 6-10, 1924.

With the public relations department established under the direction of a trained manager with competent assistants, every branch of public relations activities should be co-ordinated under the direction of the new department. Co-ordination of all public relations activities is just as necessary as co-operation of all departments is necessary.

If you would make your public relations department a success organize it under the direction of some one who knows at least the fundamentals of the public relations business. Recognize the department as one as important as any other in the company. Give it a free hand and opportunity to do its work as its manager thinks it should be done, just as you give your other departments a free hand to do their particular work as it should be done. Tell your public relations department everything about the business; give it authority; put it under the direction of one executive and one only; centralize in it all of your public relations activities of every character.

Support your publicity with performance. You will find that your public is fair when the facts are known and that, when convinced of your honest endeavor, will accord you generous treatment.

Cold Soup*

Standardized Publicity Must Be Given Local Treatment—Railways Should Advertise in the Same Way as Any Other Business—The "Lag Factor" Is Gaining Recognition

By *John S. Bleecker*
Day & Zimmermann, Inc., Philadelphia

THERE is no more sense in undertaking to send out from a centrally located headquarters in New York or Philadelphia prepared publicity copy for a street railway operating in a distant city than in attempting to send a bowl of soup from the Traymore Hotel to the Marlborough-Blenheim expecting it to be hot on delivery. At the same time, there is every reason in the world why soup should be canned, and very delicious hot and cold soup is prepared from tins. It is, however, in every instance given such local treatment as will make it fit the circumstances surrounding its consumption. Publicity matter can also be handled the same way.

I have heard it said that a street railway which was not making money, could not afford to spend money on advertising, and that one which was making money did not need to. As a corollary of the above, I would say that a company which did not spend money on advertising and the establishment of satisfactory public relations could not be successful and that a company making some money without publicity would make a great deal more with it.

Practically all of the publicity matter indulged in by seven traction and nine bus lines passes across my desk. There is no attempt made to standardize publicity for these various properties. Methods applicable at one point are either unnecessary or disadvantageous at another point. Peculiar or unusual local conditions call for special treatment. There is only one general rule applicable to all and that is, "Keep everlastingly at it." We have no set percentage of the gross earnings allocated to publicity and advertising activity, but we do not look askance at the tendency to increase the appropriations from the almost absurd minimum of one-tenth of 1 per cent to as high as 3 per cent. Ordinarily, however, it has been running less than 1 per cent. When the budgets are prepared at the beginning of the year we discuss fully the question of an appropriation for publicity and include the figure decided upon, whether small or large, in the actual estimates. The decision regarding appropriations is made in each case independently of the others.

We urge all operators to give to the question of publicity and advertising the same enthusiastic interest and constructive thought as they do to operating and engineering questions. We do not suggest that they accept so-called "boiler plate" or standardized copy without special local treatment any more than we would recommend that everybody order the same kind of soup for lunch, but we do tell them that soup is nourishing and has a definite place on the menu. We do not send them advertising material and tell them they must use it, but we do send them large quantities of advertising suggestions which have proved beneficial elsewhere. There is no more reason for not undertaking to apply approved advertising matter to a local situation than for not using an accounting form or a motor or wheel which has proved its value elsewhere.

Have something in the newspapers every day, keep in close contact with the newspaper reporters, welcome them into the office, give them all the information that they want about accidents or anything else in connection with the property, remembering that when newspaper items are published that they should be truthful and full rather than sketchy and inaccurate. Moreover, we urge managers to keep in contact with the editorial staff through associations like rotary clubs, country clubs and civic bodies. We encourage the purchase of advertising space in the newspapers, believing that a concern which does not advertise is not alive to its possibilities. We stress the fact that the news, editorial and advertising departments of a newspaper are absolutely separate and distinct.

The character of publicity on the various properties which is favored by the local management and by those into whose hands the details of advertising are placed is as varied as the individual peculiarities of the men themselves. Men who are imbued with the spirit of service and who have experienced the reaction resulting from contact with the public, however, are quite alive to the particular kind of publicity needed in their own localities.

Pamphlets, booklets, general advertising matter and, in some instances, newspaper write-ups are submitted to us for comment, either before they are published or soon afterward, so that we may be of assistance to the local manager, but in no case is the responsibility for the publicity taken off the shoulders of the local men.

There is one phase of publicity which seems to be getting a more thorough recognition than ever, and that is what might be termed the "lag factor." Once the street car magnate went around, his chest out, lording it over the electric light and power man. Today the situation is reversed and the electric light and power man is sorry for the railway man. While certain natural causes have brought about the reversal of position, at the same time it is a fact that to overcome some of the electric light difficulties, intensive publicity was indulged in for many years. Street railways, on the other hand, neglected this publicity until trouble came. It took the electric light and power companies years of continuous publicity to attain their present enviable position, and it will take more than a few months for the electric railways to catch up to them.

The result of publicity is oftentimes not reflected in the condition of a property for months, and perhaps years, after the campaign has been undertaken. Spasmodic publicity will produce spasmodic results, and these spasms will be separated by an interval of time.

It may be that where publicity effort is spasmodic, its consequences could be plotted as a curve, alternately rising and falling, from zero to a maximum, and then back to zero or perhaps below the line. There would be a periodicity and a phase relationship between the publicity and its results which if heard over a radio would be anything but harmonious.

Continuous, constant, intelligent and thorough publicity will eliminate the "lag factor." It is along these lines that we are constantly urging action on the part of those in charge of the properties that we manage.

The Purposes of the Public Utilities Advertising Association*

By W. H. Hodge

Manager Advertising and Publicity Department
Byllesby Engineering & Management Corporation, Chicago

W. H. Hodge

This Organization, Which Is Affiliated with the Associated Advertising Clubs of the World, Is Setting New Standards for Ethics and Co-operation

THE Public Utilities Advertising Association, which was organized at the American Electric Railway Association convention at Chicago in 1922, now has about 230 members, all actively interested in the advertising of one or more of the utility industries—electric railway, electric light and power, gas and telephones. Individuals or companies may take out memberships. Our primary purpose is to increase the efficiency of public utilities advertising toward the advancement of the best interests of operating companies. We want to make every dollar spent for advertising return the greatest possible value. We want to develop further the power of advertising for utility companies so that it will increase earnings paid by a pleased and satisfied public; so that it will further harmonize the relations between the public and the utilities and achieve the sustained good will, which cannot be secured in any other manner.

Advertising in the United States is a large, successful and well organized industry. The public utilities do not yet realize its power and possibilities. Many other kinds of business understood the value of advertising long before we did. We are catching up rapidly, but we still have a long way to go.

Advertising is internationally organized in the Associated Advertising Clubs of the World, which is the clearing house for all that is best in advertising thought and practice, and sets the rules and standards, just as the American Electric Railway Association influences the progress of your industry. It is composed of some 25 organizations representing every branch of advertising, all the way from the advertiser to the many mediums through which it is expressed.

It was only through organization of the Public Utilities Advertising Association that the public utilities could join this important and forceful body and put public utilities advertising on the national advertising map. In this channel we are in touch, in a collective sense, with other advertisers, with the writers and manufacturers of advertising and with the publishers and others who provide the vehicles for reaching the public eye and thought.

As a department of the Associated Advertising Clubs of the World, we are in a position to see that public utilities advertising is accorded the recognition it deserves and to profit to the full extent from contact with those who spend their lives and a great deal of money in making advertising pay. We, also, have something to contribute in the way of experience and methods and from the results of showing utility companies not utilizing advertising fully how they can avail themselves of the opportunities before them.

In the structures of the national utility associations—with one exception—little has been provided to serve as a meeting place for the people in these industries who carry on the advertising functions. Many convention speakers have urged more and better advertising; little has been done to give the men and women actually working with advertising a forum to discuss their problems, ideals, ambitions and plans—to exchange ideas—to help them accomplish the truly difficult things it is so easy to build platitudes about. The national association programs have talked a lot about advertising but they really have neglected it.

We have in mind, also, the fact that utilities advertising will not progress unless we attract individuals of the proper ability and character to these particular fields. It is hoped that our association will be made an agency for employment on the one hand and the development of talent on the other.

We propose to collect and distribute among our members all possible information about and examples of utilities advertising; to assemble data relating to proved results; to study budget making and costs. By the exchange and comparison of products we propose to stimulate originality and develop new and advantageous conceptions of what, when, where and how to advertise.

We are pledged to high standards, accepted ethics and to earnest co-operation with our national, geographical and state utility associations.

The Public Utilities Advertising Association is young, modest and inexpensive. It has hardly started to prove its usefulness. But what it lacks in some respects we hope it will more than overcome in energy and practical accomplishments. We invite the interest and the membership of every utility company and every individual actually interested in better and more efficient advertising practice.

I wish also to say a word regarding certain exceedingly useful work accomplished by the National Vigilance Committee of the Associated Advertising Clubs. This committee, and the Better Business Bureaus which it fosters in many cities, are the police force of advertising. Their business is to keep out and prosecute the untruthful advertisers, the frauds and the fakers. One of their big achievements is the suppression of "wildcat" financial advertising. Every dollar saved to the public means that much money conserved for investment in sound securities such as the public utilities offer.

The National Vigilance Committee and the Better Business Bureaus deserve our moral and financial support. Their work is kept going by sustaining memberships, the cost of which is insignificant compared with the substantial good accomplished for honest people and honest business. They already have been formally indorsed by the customer ownership committee of the National Electric Light Association.

---

*Abstract of a paper before the annual convention of the American Electric Railway Association, Atlantic City, N. J., Oct. 6-10, 1924.

◆

Advertising the Interurban*

By James P. Griffin

Vice-President and General Manager
Texas Electric Company, Dallas, Tex.

THE Texas Electric Railway has valuable interurban connections at Dallas and at five other points has valuable steam railway connections—Denison and Sherman in the north, Dallas in the center, Waco in the south and Corsicana in the southeast. We naturally point much of our advertising effort to care for the opportunities to secure traffic off the interurban and steam railways at these connecting points, also to deliver traffic to them at these points. In our advertising plan the daily and weekly newspapers naturally take a prominent place. We believe, and I feel that this is commonly accepted everywhere, that the newspaper offers the best field for general advertising for the interurban, doubtless reaching more readers than any other medium. It is our policy to carry regularly each day or each week certain space in the various newspapers published daily or weekly in the cities and towns served by us. In the two large cities of Dallas and Waco, where we do not use space each day, we contract for certain space for the year, using this space largely for advertising special events.

Under the Texas statutes we are permitted to exchange transportation for advertising space with the newspaper people, dollar for dollar on regular rate basis, and we have taken advantage of this opportunity to increase our newspaper advertising. We have had printed a special form of ticket for use under these exchange advertising agreements, containing $10 worth of transportation in 5-cent coupons, which the holder presents direct to the conductor on the car. We keep a ledger account with each one with whom we have a contract under this agreement, charging him with transportation as issued, and crediting him with his bills for advertising as rendered.

---

*Abstract of a paper before the annual convention of the American Electric Railway Transportation & Traffic Association, Atlantic City, N. J., Oct. 6-10, 1924.

We believe in using time cards freely, and put out each year through our agents and traveling representatives and by mailing to selected lists of steam railway agents and hotel men some 50,000 of our time card folders. The time cards for the three divisions are printed on a large sheet of cardboard, and are carried in frames under glass in all our stations. Printed cards for each division are framed and displayed in hotels, banks, post offices, drug stores, restaurants, etc.

We also get out special cards showing schedules out of certain principal points, with arriving time as Dallas. For Dallas a card is printed showing the leaving schedules of all the interurban lines serving the city.

We also get out printed blotters for general distribution. These are usually distributed by our traveling representatives when making their trips over our lines into surrounding territory. Car dash signs are used for advertising special events, such as our fairs, etc. The boards are also used quite regularly for advertising theatrical attractions in Dallas, also for the circuses, and other purposes where there seems to be opportunity to attract traffic. We have used some postal cards showing scenes along our lines and our equipment. These have been sold or given to newsstands, drug stores, and other places where postal cards are sold. Some are mailed out and distributed by our traveling representatives when making their trips. We believe that postal cards are entitled to a limited space in the interurban advertising plan.

In our interurban cars car cards are carried, devoted to various thoughts of merchandising transportation, safety of interurban service and use of the interurban instead of the automobile. These cards are placed in frames under glass in the front of the car and on the middle partition. It is our policy to mail samples to a number of advertising men in the industry, and we receive from them samples of cards they are using in similar advertising plans.

This year we joined with the other interurbans in Dallas in installing a booth at the State Fair at Dallas. This exhibit includes a miniature interurban car, which is operated with certain safety devices, and a large map of the various interurbans entering Dallas, with a flasher arrangement so that the several lines and stations are flashed in rotation. A stereopticon will be operated, showing scenes along the interurban lines and epigrammatic interurban advertising thoughts.

One of our chief dependencies of advertising is through the medium of personal solicitation. Our traveling representatives are constantly going over the territory served and frequently into surrounding territory. They personally present the interurban appeal to possible patrons. As one of their means of approach they carry pencils, penholders and notebooks. The pencils are distributed more or less generally at points off our lines; the penholders are usually placed in hotels and at the check counters in banks; and the notebooks are given to hotel clerks, railway agents and others at strategic points. We make it a policy to have our traveling men accompany trade trips of chambers of commerce, business men's leagues, etc., on which occasions they distribute our "hand out" advertising matter.

Advising the public that our agents' are prepared to make theatrical, railroad or hotel reservations for our patrons has been productive of considerable revenue to us. The agent telephones our general passenger office, and receives in return advice as to the making of the reservation. Patrons have found this service dependable, and use it frequently.

Engineering Executive Committee Meets

A MEETING of the Engineering Executive Committee was held at Atlantic City, Oct. 5. Members present were: President H. A. Johnson, C. H. Clark, C. R. Harte, R. C. Cram, Daniel Durie, M. B. Rosevear and G. C. Hecker, representing Secretary Welsh.

The report of the committee on Engineering Manual was approved. Witn regard to revisions to be made in the manual sections between publications of the bound volumes, which now will be every three years, it was agreed that every effort should be made to keep the technical committees active in putting through revisions as soon as desirable. Between publications such revisions will be included in an annual supplement.

A report of the activities of a committee of this association in connection with the division of simplified practice of the Department of Commerce was presented by R. H. Dalgleish. A number of meetings have been held which have been attended by Mr. Dalgleish and C. S. Kimball. The standardization of material used in all branches of industry is included in the program of this department. It was voted that this committee be continued to work with the department of simplified practice.

Mr. Hecker described the exhibit of association standards at the convention. A motion by Mr. Harte was adopted that the railway companies and manufacturers who have supplied material for this exhibit be given a vote of thanks by the association.

Jackson P. Dick, chairman of the committee on purchases and stores, appeared before the executive committee and requested authorization for a joint committee to co-operate with similar committees of the National Electric Light Association and the American Gas Association on purchases and stores. Authorization was granted.

Mr. Harte reported on the A.E.S.C. activities and on the relations of this body with the Engineering Association. A number of specifications now being handled through the A.E.S.C. were discussed. It was brought out that the A.E.S.C. will not take up standards for one or two industries only, but that a general use of the material in question over a wide range of industries is necessary before its standardization will be considered.

At present the reports of the various sectional committees of the American Engineering Standards Committee are incorporated in the report of the secretary of the Engineering Association. It was moved by Mr. Cram and adopted by the committee that hereafter reports of these representatives on the sectional committees of the A.E.S.C. be published separately.

With regard to the standardization of lumber sizes, Mr. Harte moved that a special committee be appointed with representatives from the way, equipment, and buildings and structures committees to investigate and report on the recommendations of the central lumber committee. It was requested that action be taken prior to the Midyear Meeting of the association.

T. & T. Executive Committees

THE executive committee of the Transportation & Traffic Association held a meeting on the veranda of the Marlborough-Blenheim Hotel Monday morning. There was considerable comment concerning the committees which should be continued next year and it was agreed that the subjects of traffic congestion, ride salesmanship, and trackless vehicle operation should be continued. A letter was read from Edward Dana suggesting an investigation to find out what benefits result to railways from conventions held in their localities.

The new executive committee of the Transportation & Traffic Association held a meeting at Atlantic City following the general session on Thursday. A report from the subjects committee was made by C. H. Clifford, vice-president and manager Northern Texas Traction Company. Four general subjects were decided upon, and will include the following: Merchandising, traffic congestion, accident prevention and use of the bus by electric railway companies. A fifth subject will be selected later.

It was decided that the committee on relief of traffic congestion should consider methods of carrying out the recommendations already agreed upon rather than simply an elaboration of these measures which are now well understood by railway men and accepted by them. Attention was called to the importance of specifically defining the nature of the work assigned to each committee. Still another decision made to facilitate and improve the work of committees was that the committee chairman will meet with the executive committee for consideration of next year's reports before final printing.

The News of the Industry

Change in Spartanburg

New Company Offers to Operate Buses on Regular Schedule—Controversy at an End

The South Carolina Gas & Electric Company, formerly the South Carolina Light, Power & Railways Company, was recently purchased by W. S. Barstow and associates of New York. R. L. Peterman, representing the new owners, appeared before the City Council of Spartanburg on Sept. 24, and stated his readiness to put on sixteen buses to augment some proposed restored railway lines. This action is expected to solve the problem of Spartanburg, a city of 25,000 population, where the street cars have been idle more than two years following a long legal fight between the city and the operating company, in which the city contended the company had not lived up to its franchise. Since the case has been in litigation the company has been attempting to handle the city traffic with four buses.

LITIGATION OF LONG STANDING

The controversy in Spartanburg dates back to December, 1922, when the company abandoned railway operation on the ground that it was unprofitable. Later the South Carolina Railroad Commission authorized abandonment in the city, but this action was followed by a mandamus petition by the city demanding the restoration of service. The Supreme Court at Columbia ruled that the company must renew railway operations. The opinion upheld the contention of the city that the franchise of the company to operate cars was a contract, which the South Carolina Railroad Commission had no authority to abrogate. Prior to the decision of the Supreme Court the company with the help of its President George B. Tripp, worked out a plan for the operation of a bus system putting four buses in operation in the city proper with two car lines on the suburban lines. Meanwhile the company decided to appeal to the Federal Court.

But now under a new management, the City Council is willing to meet the Barstow people half-way. At a Council meeting on Sept. 24, an agreement was reached whereby the Barstow management promised a fifteen-minute schedule to outlying mill towns, thus linking up a large mill population with the city and bringing many more thousands of dollars to the merchants in Spartanburg.

The building of the Southern Railway shops in the northern suburbs of the city has already brought several hundred new citizens to Spartanburg, and when completed in January, 1925, it will bring 5,000 more people to add to the city's population. The shop site is one and one-half miles from the heart of the city, and to get the several hundred workmen there now to and from their work is quite a problem. When the five thousand come the problem will be multiplied, unless the Barstow interests solve it by adding still more buses after they have doubled the original sixteen.

Many Provisions of Cincinnati Franchise Still Unsettled

Revision of the provisions of the proposed traction franchise tentatively agreed upon has been completed by the conferees representing the city of Cincinnati, Ohio, the Cincinnati Street Railway Company and the Cincinnati Traction Company. Nine provisions of the tentative franchise ordinance still are in dispute and the conference will be resumed in a final effort to effect an agreement by compromise.

The most important of these is the provision relating to street paving. The city's representatives insist that the operating company shall pay one-half of the cost of restoring existing streets which the cars traverse, while representatives of the Cincinnati Traction Company assert that only the cost of future repairs should be shared by the company, and that it should not be called upon to aid in the rejuvenation of existing worn-out streets. The Cincinnati Traction Company refuses also to defray any portion of the cost of maintaining the office of the Director of Street Railroads, while the city insists the company share in the expense up to $15,000 a year.

A further disputed point is whether or not the operating company should be compelled to rehabilitate the traction system by Dec. 31, 1927, or whether the time is to be extended to Dec. 31, 1928. The remaining controverted provisions pertain to the guarantee fund, whether the 5 per cent dividend should be cumulative during the rehabilitation period, the increased rates of fare and the payment of a 10 per cent premium on stock, if the city determines to purchase the system.

On the question of increased fare for owl service, the company would charge double the day rate of fare between the hours of 1 and 5 o'clock in the morning. The city strenuously objects to that increase, but would permit a provision that a different rate of fare be charged for owl service, if agreed upon by the Director of Street Railroads and the operating company.

The city refuses absolutely to pay any premium on the outstanding stock of the traction company if it determines to take over the system, but will pay par value for such stock. The proposed new ordinance will likely provide that a charge be made for transfers, if by so doing the rate of fare may be kept down.

Eight Cents Authorized

Oklahoma Railway Puts Higher Fare Into Effect—Parking and Jitney Ordinances Adopted

The Corporation Commission on Sept. 28, 1924, issued a temporary order, granting an increase to the Oklahoma Railway to 8 cents with 2 tickets for 15 cents. The company on Sept. 24 filed application for an increase to 10 cents single fare, three tickets for 25 cents. The fares then in force were 7 cents, four tickets for 25 cents. The rate for school children will remain at 2½ cents. The railway company alleged in its petition that operating costs in Oklahoma City were excessively high and burdensome because of automobile traffic congestion, especially in the business district, where automobiles are parked. This congestion, it claimed, resulted in slowing down schedules, reducing patronage and increasing loss from damage suits resulting from collisions. It was also pointed out that numerous railroad grade crossings in the city necessitated frequent stops for flagging cars or to await passing of trains. It was also alleged that automobiles carry many people in and out the business districts who would otherwise patronize the street railway.

COMMITTEE APPROVED OF HIGHER FARE

The company presented the report of a committee appointed by the Mayor of Oklahoma City and made in February of this year. This committee, after thorough investigation, recommended an increase in fares to single fare of 8 cents, with two fares, 15 cents. The company also referred to the receivership application in the federal court brought by the Mississippi Valley Trust Company, representing bondholders of junior mortgages, as a reason why relief is necessary.

The commission, in its order, states that it "is driven to the conclusion that a temporary increase in the fares for the transportation of passengers in Oklahoma City is necessary, such increase to be in effect until a more complete investigation of the affairs of the company may be had, either at the hands of Oklahoma City or by this commission."

The order was put into effect by the railway Oct. 1.

After relief had been granted by the commission, the Mississippi Valley Trust Company, through its attorneys, asked for a continuance of the receivership application. The federal court, therefore, continued the case until Jan. 15, 1925. The City Commissioners have already adopted the 20-deg. parking ordinance and also an ordinance prohibiting operation of jitneys within two blocks of a street car line.

Rensselaer Institute Commemorates Centenary—F. R. Low Awarded Degree

The Rensselaer Polytechnic Institute, Troy, N. Y., celebrated the 100th anniversary of its founding on Oct. 2 and 3 with ceremonies which were participated in by eminent educators, delegates from practically every engineering society in this country, a number of the leading societies abroad and by a large number of the engineering alumni of the institute. In addition to the unveiling of several commemorative tablets and an excellent pageant in the evening outlining the history of the school, the exercises consisted mainly in addresses by prominent educators and engineers.

The principal addresses were made by Secretary of Commerce Hoover, Sir Charles L. Morgan, president of the Institution of Civil Engineers of Great Britain; Henry Abraham, past-president of the Society of Electrical Engineers of France; Fred R. Low, president American Society of Mechanical Engineers, and many others prominent in the engineering world.

Frederick Rollins Low, editor of *Power*, a McGraw-Hill publication, was awarded the degree of doctor of engineering by the institute. Mr. Low is the author of "The Power Catechism," "The Compound Engine," "Condensers" and "The Steam Engine Indicator." He has been editor of *Power* since 1888.

Purchase Proposal Advanced for Greater Kansas City

A new factor has appeared in the electric railway situation in Greater Kansas City. This is the proposal of Mayor Gordon of Kansas City, Kan., to Mayor Beach of Kansas City, Mo., suggesting that the two cities buy out the Kansas City Railways and operate their own systems as a solution to the present transportation problem. He suggests also that both cities apply to their state Legislatures for authority to issue bonds to purchase the transportation system. It is Mayor Gordon's idea that Mayor Beach should appoint a committee of five substantial business men to meet a like committee from Kansas City, Kan., to discuss the proposition fairly.

In his letter he referred to the Kansas City Railways being in receeivers' hands and the difficult problems confronting the receivers, which they have handled well. He said that these problems might be more firmly grappled with if the municipalities owned the systems. He wrote at some length on municipally owned and operated transportation systems, declaring that if economically operated and properly administered they would solve the transportation problems.

He said that the idea that the street car as a mode of transportation is passing into ancient history might be true in the congested districts of New York, or some of the larger cities, but that it was not true in either of the two Kansas Citys, and in his judgment would not be true for some time to come. He said he believed the bus was not a reliable mode of transportation in these two cities because in bad weather it couldn't be operated as successfully.

Bus Petition Causes Stir in Albany

Attorneys for the United Traction Company, Albany, N. Y., and the K. L. W. M., Inc., were given until Oct. 20 to file briefs on the application of the K. L. W. M. for a certificate for the operation of a bus line between Bloomingrove and Troy, following the adjourned hearing before the Public Service Commission on Oct 2.

Opposition of the United Traction Company was based on the fact that the certificate, if granted, would make possible the operation of buses by the K. L. W. M. between Albany and Troy, by operating between Albany and Bloomingrove over a route for which the company has a certificate. The K. L. W. M. contended that even though buses did run to Troy, the travel would be light compared with the traction company, the distance being greater, the service slower and the fare higher.

John E. McLean, who appeared for the traction company, offered in evidence the financial reports of the company for the year 1923 and for the two quarters of 1924 to show that the company could not afford to lose any of its traffic.

Mr. McLean also appeared for the Troy & New England Railroad, protesting against the granting of the certificate because it would permit the K. L. W. M. to operate between Averill Park and Troy in competition with a branch of the railroad. Objection was also made by he New York Central Railroad.

Mayor Makes Suggestion for Rockford Franchise

For many months now the Rockford Traction Company, Rockford, Ill., has been negotiating for a new franchise, but without success. The company has been insisting upon a 20-year franchise on the ground that it will be unable to borrow the money for needed extensions on a franchise of shorter length. Mayor Hallstrom of Rockford and his supporters want the railway to submit an application for a 10-year franchise. The company is also reluctant to pay for any track paving, while the city is demanding that the company pay for all track paving costs. Recently Mayor Hallstrom made counter proposals to the company's plans. He said he would withdraw his objection to a 20-year grant providing the company deposit $750,000 in a Rockford bank as a guarantee so that provisions of the franchise would be carried out. The Mayor's proposal of a $750,000 guarantee fund would be used within twelve months to make certain improvements in the company's rolling stock, line extensions and paving repairs. The tentative draft which was submitted by the company, in the opinion of Mayor Hallstrom, forces the city to pledge public credit with the equity in the property unprotected. He said he didn't care whether the service was supplied by buses or street cars.

International Railway's Buses Given Ten-Year Franchise

The International Bus Corporation, a subsidiary of the International Railway, Buffalo, has been granted a franchise by the City Council to operate buses on Delaware Avenue from McKinley Square to the Buffalo-Kenmore city line and on East and West Delavan Avenues from the city line to Niagara Street. The franchise is for a term of 10 years. The fare will be 10 cents with free transfers to connecting car lines. Under the terms of the franchise the municipal authorities will have the right after April 1, 1927, to take over the bus service.

Application will be made at once by the International Bus Corporation to the Public Service Commission for the necessary consent to operate the two bus lines in Buffalo. As soon as the Public Service Commission gives its consent, the company will place orders for a fleet of double-deck buses to operate on Delaware Avenue and single-deck buses will be placed in service on the East-West Delavan Avenue lines.

The City Council divided three and two on the franchise, Mayor Frank X. Schwab and Commissioner of Public Affairs Frank C. Perkins, the Socialist member of the Council, being opposed. Mr. Perkins renewed his plea for municipal-owned buses on these two routes, but was voted down. The action of the Council turns down the permit sought by the VanDyke Motor Bus Corporation, which proposed a series of city-wide bus routes with an initial investment of upward of $1,250,000. The petition of this company was rejected by the city because there could be no transfer arrangement from buses to connecting car lines.

When the car riders ask for transfers to bus lines an additional charge of 3 cents will be made for a transfer. The carfare is 7 cents so that the 3 cents extra charge for a transfer to buses will make the 10-cent fare when passengers use buses and cars. The previous application of the International Bus Corporation asked for a 10-cent fare and a 3-cent transfer charge. The company amended its application by striking out the transfer charge and by enlarging the Delaware Avenue route.

Safety Bulletin Issued

The safety bureau of the Buffalo Chamber of Commerce has issued a bulletin urging automobile drivers and others to use extreme caution to avoid car accidents. The bulletin says:

> A street car is a heavy vehicle; it cannot always be stopped suddenly and it certainly cannot turn out to pass you.
>
> If an automobile and a street car meet, a street car won't get the worst of the argument.
>
> The motorman is on the alert and nine times out of ten he will avoid an accident if he has half a chance, but the tenth time may send you to the hospital and your car to the junk pile.
>
> Remember: At all streets the street car has the right of way, no matter in which direction the vehicle is approaching from—except where the traffic is being directed by an officer.
>
> Never pass a street car on the left, you may bump into one coming from the opposite direction.
>
> The street car is set in its ways; don't argue with it.

News Notes

Parlor Car Service Begun. — The Eastern Massachusetts Street Railway has started its parlor car service between Boston and Lowell, which is a non-stop service for $1 per trip. Twenty trips will be made on week days and eighteen on Sundays.

Bus Lines Allowed.—Three new bus lines within the city of Syracuse, N. Y., were authorized Oct. 3 by the Public Service Commission. Two of the routes will be operated by the Syracuse Railway Co-ordinated Bus Line, Inc., a subsidiary of the New York State Railways, and the third certificate was granted to Harvey D. Gros, general manager of the Syracuse & Eastern Railroad. Hearings on all three of the applications were held before Commissioner George R. Van Namee. All three certificates provide that transfers shall be made from the bus lines to the Syracuse lines of the New York State Railways.

Fare Increased to Ten Cents.—The Cincinnati Traction Company, Cincinnati, Ohio, increased its rate of fare from 9½ cents to 10 cents on Oct 1. The half cent increase is a result of the service-at-cost franchise which provides that whenever there is a deficit in operating expenses the fare will increase one-half cent every three months until the deficit is wiped out and a surplus of $600,000 is established. Although this deficit gradually is being cut down, it still amounts to more than $1,500,000 W. Kesley Schoepf, president of the traction company, said that the rate of fare probably would have to be increased to 15 cents in order to wipe out the deficit entirely.

Considers Bus Appropriation. — An appropriation of $17,000 for two municipal buses for operation on Empire Way in connection with the Seattle Municipal Railway cars has been considered by the City Council and referred to the city Utilities Department. Vigorous protest was voiced by the Seattle & Rainier Valley Railway, which declared that the proposed buses would be operated in competition with Rainier Valley cars. The company asked that consideration of the appropriation be withheld until the Council took up a pending resolution for the purchase by the city of the Rainier Valley system.

Lower Theater Rates Promised.—Announcement has been made by the Indianapolis & Cincinnati Traction Company, Indianapolis, Ind., that it will restore the low fare night theater rates to Indianapolis. The innovation of an unusually low rate of fare for night travel created a good deal of comment last year and several other railway companies adopted this practice following this company's example.

One-Man Cars in Superior.—After a study of five months on the petition of the Duluth Street Railway to establish one-man car service on its South Superior and Billings Park lines in Superior, Wis., formal approval has been given by the Railroad Commission. Double-truck cars remodeled into one-man types will be placed in service. Insufficient operating income to meet the rising operating expenses was cited by the company as the reason for this measure of economy. Testimony presented to the commission showed that the operating income of the company from Oct. 1, 1923, to April 1, 1924, amounted to only $7,134, whereas the company is allowed by the Commission to earn $8,167 per month alone on its investment of $1,225,000 or $48,999 instead of $7,134 for the six-month period.

Answer Sent to Governor.—Following Governor Pinchot's letter to the Pennsylvania Public Service Commission rebuking it for its "unseemly haste" in authorizing a temporary 8-cent fare on the lines of the Philadelphia Rapid Transit Company. Chairman Ainey has sent an answer to the Governor stating that the commissioners welcome an investigation into the existing fare situation in Philadelphia and into all the commission's actions in this connection.

New Wage Scale in British Columbia.—The British Columbia Electric Railway, Vancouver, B. C., has completed negotiations for a new wage scale for its trainmen. Motormen will receive an extension of their present maximum rate of 62 cents an hour for three years. Janitors, carhouse men and a few others, numbering about two hundred in all, will be reduced 3 cents an hour. One-man operators in Vancouver will not be affected, continuing at 68 cents. In Victoria, where all the men are one-man car operators, the rate will be reduced from 68 to 64 cents an hour.

Hoarding Tokens in Buffalo.—Gambling in car tokens sold by the International Railway, Buffalo, N. Y., is under way with announcement in the newspapers that there is danger that the Public Service Commission will soon hand down its decision on the application filed by the railway company to charge 8 cents cash on local lines in Buffalo or two tokens for 15 cents. The present fare is 7 cents or 4 tokens for 25 cents. Passengers are buying four tokens for 25 cents every time they pay a cash fare and hoarding the three other tokens so they can be used if the fare is raised. This would save car riders 5 cents on every four rides. The only way the International Railway can offset the use of tokens bought now when the fares are increased is to change the tokens, but this would necessitate a large expenditure. Company officials doubt if the increased cost of the new tokens would warrant changing them to prevent such hoarding.

Effort Made to Attract More Riders.—The Fitchburg & Leominster Street Railway is experimenting with a new system to give longer rides for 10 cents. A return check system is used whereby passengers are given twice as much mileage for the same price. Patrons of the south side loop who ride only as far as either terminal without transfer are given a check when they pay a 10-cent fare that will carry them back to their starting point. It is expected that the new system will cause more liberal patronage of trolleys.

Trolley to Carry Mail. — Arrangements are under way at Southington, Conn., to have the U. S. mail en route to the town brought from Meriden by trolley. This was made necessary by the discontinuance of the railroad service by the New York, New Haven & Hartford Railroad.

Transfer of Passengers Brings Agreement.—Following the refusal of the City Council of Olean, N. Y., to sanction the petition of the Iroquois Motor Trails Company of Buffalo, for permission to use the streets of that city in connection with the operation of a bus line from Olean, Salamanca and Buffalo, an announcement has been made by that company that the line will continue on its present schedule. Through an arrangement made with the Olean, Bradford & Salamanca Railway, passengers will be transferred to the railway's Boardman. East Olean line, which will convey them into the city. The bus company, with this plan in effect, will convey the passengers into Olean via the trolley system, free of charge, charging fare only to the Olean city limits.

Bus Service to Start.—The Boston & Maine Railroad has installed an automobile bus service between Ashburnham and South Ashburnham on the Fitchburg division. It gave up the train service some time ago because it did not pay; then it tried a gasoline engine, but had to abandon that also on account of the cost of operation. As a final resort it will try an automobile bus that costs about $7,000 and has a 60-hp. engine. The fare between the two stations will be 10 cents.

Seeks Fare Advance.—The Atlantic City & Suburban Railway and Shore Fast Line, Atlantic City, N. J., have petitioned the Board of Public Utility Commissioners of New Jersey for permission to increase passenger rates. The Suburban line asks for an increase from 6 to 7 cents in Atlantic City, while the Shore Fast Line wants to increase fares from 5 to 7 cents in Ocean City. Other slight increases, including those in school tickets, are also asked from the surrounding towns. The Suburban line would increase the fare from 14 to 16 cents between Atlantic City and Pleasantville.

Bus License Granted. — The City Council in Attleboro, Mass., has appropriated $1,200 to cover the estimated deficit from operation of the Interstate Consolidated Street Railway during the next four months. It has also voted to grant license to the same company to operate buses between Attleboro and Providence.

Wants Two-Men Cars.—A resolution was introduced in the City Council of Erie, Pa., on Oct. 2, by William D. Kinney, Director of Parks, calling for an investigation by city officials into the operation of one-man cars on the streets of Erie by the Erie Railway, the company recently formed to assume the operation and assets of the Buffalo & Lake Erie Traction Company's lines within the city. He called attention to the fact that an 8-cent fare was charged for short hauls on cars which, because they were not manned by two men, he claimed gave inadequate service.

Financial and Corporate

Foreclosure Proceedings Filed

Trustee for the St. Louis Transit Bonds Wants Sale of Property—Suburban Holders Want Interest Protected

The first formal step toward a complete reorganization of the United Railways, St. Louis, Mo., was taken in the United States District Court, Oct. 3, when counsel for the Mercantile Trust Company, trustee for the St. Louis Transit 5 per cent bonds, filed foreclosure proceedings against the car system. The petition asks for a consolidation of the United Railways litigation pending in the federal court and for the sale of the properties of the company for the benefit of the creditors. Federal Judge Faris has expressed himself as favoring an early termination of the present receivership.

SUIT IS DIRECTED AGAINST THE RECEIVER

The suit was directed against Receiver Rolla Wells, the St. Louis Transit Company and the St. Louis Union Trust Company, trustee for the $30,000,000 issue of general 4 per cent bonds. The latter has a foreclosure suit pending alleging the United Railways has defaulted on the $9,790,000 mortgage securing the Transit 5s, which are past due since Oct. 1. Pleading for a consolidation of the litigation, the Mercantile Trust Company contends that foreclosure under the general 4 per cent bonds would seriously impair the Transit 5s, now past due, while the general 4s do not mature until 1934.

Reorganization of the system will proceed without the participation of the holder of the $6,500 000 of Suburban system bonds if their protective committee remains firm in its announced stand of rejecting the reorganization plans as they relate to the Suburban securities.

COUNSEL STATES THE CASE

Stanley Clarke, counsel for the reorganization committee, made this clear, saying:

"We deem more than fair the offer which we have made to pay off $2,000,000 of the Suburban bonds immediately and retire $100,000 additional each year for ten years. The Suburban bondholders will be given an opportunity to deposit their securities whether or not the committee representing them approves of it, and their acceptance is a matter for them to determine."

At a meeting on Oct. 1 held at the United States Bank in St. Louis, the Suburban bondholders tentatively accepted a new proposition from the reorganization committee providing for the guaranteeing and retirement of a new issue of $4,500,000 Suburban bonds to replace the present general issue. Prior to the meeting the Suburban security holders had assumed a belligerent attitude and a long legal battle threatened.

The Suburban bondholders' committee had another meeting scheduled for Oct. 8, to determine what steps to take to protect their interest in view of the foreclosure suit under the Transit bonds. Members of the committee said they were ready to take over and run the Suburban lines as a separate system if necessary to protect their holdings. It was stated that such step would be taken with hesitancy because of consideration for the public, but would become necessary if the reorganization committee did not guarantee the new issue of $4,500,000 Suburban bonds.

Receiver Named for Springfield Property

John S. Bleecker has been appointed receiver of the Columbus, Newark & Zanesville Traction Company, Springfield, Ohio. Attorneys James M. Butler and Paul C. Martin were appointed as counsel for the receiver. A reorganization of the property is the next step. An organization of holders of approximately $3 500,000 of bonds in the company will be attempted. It is expected that the property will be put up for foreclosure sale within a few months. An application for a receivership was made to the federal court in Columbus some months ago by the Irving Bank-Columbia Trust Company of New York. It charged at that time default of payments of interest on a $1,200,000 bond issue.

The company operates between Columbus and Zanesville by way of Newark, the local street car system in the city of Newark and furnishes electric current in Zanesville. Service will be continued as usual under the receivership, according to Mr. Butler.

Receiver Named for Maumee Valley Line

B. A. Webster, general manager of the Maumee Valley Railway, Perrysburg, Ohio, has been made receiver of the property. The appointment of a receiver had been asked by the Commercial Savings Bank & Trust Company, trustee. Suit for foreclosure of a mortgage of $345,000 on the property had been filed in Common Pleas Court at Toledo. The suit comes as a climax to a number of troubles the road has experienced. It now has an application before the State Public Utilities Commission to abandon service, but no action has been taken on the application. A change in grade of the river road between Toledo and Maumee brought about abandonment of part of the territory served by the company. The Maumee Valley Transportation Company was granted a permit on Oct. 8 to operate buses on the east side of the river between Toledo and Perrysburg.

Bluffton Property Bought by Insull Interests

Another purchase of Indiana utility and traction property, amounting to more than $750,000, was made Sept. 29 by the Samuel L. Insull interests of Chicago in the acquisition of the property of the Marion & Bluffton Traction Company, according to an announcement made at Bluffton, Ind., the head offices of the traction company.

Charles W. Chase of Gary, Ind., was elected president of the new controlling concern. Thomas G. Hamilton of Gary was elected vice-president, George F. Mitchell, Chicago, treasurer; W. D. Bohne, Chicago, secretary, and R. M. Scheidt, Gary, assistant secretary and treasurer. James S. Clark of Bluffton, former manager of the Marion & Bluffton Traction Company, will be general manager. William A. Kunkel, Jr., of Bluffton was president of the old company.

The original investment of the old company, it was announced, was $785,000. Stockholders are said to have received par for their holdings. The transfer of the property also included the Linn Grove Light & Power Company lines, which supplied light and power to two small towns near Bluffton. The branch office of the new company will be retained in Bluffton. The main office will be in Chicago.

The traction line extends a distance of 31.8 miles between Bluffton and Marion. It will give the Insull interests a direct line now from Frankfort to Bluffton, the line between Marion and Frankfort having been taken over some time ago. The newly acquired property, which has been operated under the management of Mr. Clark since the death of James W. Sale, is expected to be improved.

Seeks Discontinuance of North Hornell Line

The Hornell Traction Company, Hornell, N. Y., through Frank M. Prentice, president, and Raymond E. Page, receiver, has made application to the Public Service Commission for approval of a declaration of abandonment of a part of its line known as the North Hornell line. The line was constructed in 1913 as an extension from the then northerly terminus near the city line of Hornell to the village of North Hornell. Receipts on the North Hornell line, averaging from $2 to $4 daily, amount to only about one-third of the cost of operating the line, which is about $12 a day, exclusive of repairs and expenses of maintenance.

Since the appointment of Mr. Page as receiver, on July 29 last, receipts for the whole railroad to Sept. 1 amounted to $18,404, whereas expenses for the same period were $19 304, the petition says. The railroad is in immediate and urgent need of new rails, new ties and new equipment, but funds are not available.

Abandorment of the line was consented to by the mortgage bondholders of the railroad, provided the property was used as far as available for repairing the other portions of the railroad and the proceeds of anything sold to be used for the same purpose.

Customers May Purchase on Installment Plan.—The New Orleans Public Service, Inc., New Orleans, La., has announced, following a successful selling campaign of two weeks in which 3,400 employees bought more than 96 per cent of the corporation's cumulative preferred stock offered to them, that stock of the same issue may now be bought by the customers of the company or other local people in large or small amounts, for cash, or on the installment plan, at $10 a month. The shares, it is declared, pay dividends every three months and yield more than 7½ per cent a year on the money invested.

Wants To Issue $2,400,000. — The Lima-Toledo Railroad, Lima, Ohio, has asked the Public Utilities Commission for authority to issue $2,400,000 in securities to pay for property formerly part of the old Ohio Electric Railway. The proposed issue is divided into $650,000 common stock, $750,000 7 per cent preferred and $1,000,000 in 6 per cent 25-year bonds. It is proposed that the issue be dated as of Dec. 1, 1922. A request to issue $2,700,000 in securities in 1922 was refused on the ground that the earnings were not sufficient to carry such capitalization.

Bonds Offered. — Halsey, Stuart & Company are offering at 89 and interest, yielding more than 5¾ per cent, $9,000,000 of first mortgage and refunding 5 per cent gold bonds of the Ohio Public Service Company, Mansfield, Ohio. The bonds, known as series D, are due Sept. 1, 1954.

$7,000,000 Municipal Railway Loan Expected at Toronto.—The City of Toronto, Ont., is awaiting a court decision on a contested valuation of the Toronto Railway, when it plans to sell a bond issue to pay for taking over the utility. The case is now before the London Privy Council, whence it was carried on appeal. A loan of about $7,000,000, to be offered on a competitive basis, is expected.

Approves Issue.—The Arkansas Railroad Commission has approved the petition of the Hot Springs Street Railway, Hot Springs, Ark., to issue $68,000, par value, first mortgage, 8 per cent bonds. The bonds will mature in 30 years. The Hot Springs firm operates both the street railway and the electric light plant and has an authorized capital of $500 000.

Wants to Discontinue Line. — The Menominee & Marinette Light & Traction Company wants to discontinue its Quimby Avenue car line across the river in Menominee, Mich. In making this request, the company maintained that the operating costs of the Quimby line were $11,000 annually, while the revenues only reached $4,000, leaving scarcely nothing to pay for fixed charges or depreciation.

Discontinuance Date Set.—The Alabama Traction Company will discontinue its railway service in Decatur, Ala., and Albany, Ala., on October 11, according to an official notice signed by W. R. Speer, superintendent of the company. This suspension follows permission given several weeks ago by the Alabama Public Service Commission. It is announced that this company had been operating at a loss for some time. Several times schedules were changed, with the hope that operation could be continued. Officials announced that automobiles were carrying so many passengers that it was impossible for the railway to operate at a profit. The company has 7 miles of track and nine cars.

Old Management Retires.—Negotiations during the past two months have resulted in the Pennsylvania & Maryland Street Railway, Elk Lick, Pa., being turned over to the Wilmoth interests of Meyersdale. The Pennsylvania & Maryland was organized by the late C. H. Jennings of Towanda, Pa., and began operating in 1906 between Salisbury and Meyersdale, 9 miles above Grantsville. Later it was extended to Garrett. About a year ago the Garrett end was abandoned and trips were made between Salisbury and Meyersdale. Owing to the improved road through this section passenger traffic has decreased so greatly that the former management decided to quit.

Payments Not Made. — Preferred stockholders of the Worcester Consolidated Street Railway, Worcester, Mass., have not received, for the first time in two years, the usual payment on the back stock dividends due Oct. 1. Officials of the road say the heavy expenses of operation under the new agreement with the employees do not favor the payment.

Bonds Offered.—A syndicate including J. G. White & Company is offering at 99 and interest to yield more than 6.55 per cent $11,700,000 in secured 6½ per cent gold bonds of the Continental Gas & Electric Corporation, which through a recent merger is a subsidiary of the United Light & Power Company. The bonds, known as series "A", are dated Oct. 1, 1924, and are due Oct. 1, 1964. The principal companies controlled by the Continental Gas & Electric Corporation include the Columbus Railway, Power & Light Company, the Kansas City Power & Light Company and the Lincoln Gas & Electric Light Company. The preferred and common stocks of the Continental Gas & Electric Corporation have been sold at this time to provide over $5,000,000 cash, which, together with the proceeds of this issue of $11,700,000 of bonds, will be used to acquire practically the entire remaining outstanding shares and 25,000 additional treasury shares of the Kansas City Power Securities Corporation (owning 100 per cent of the outstanding common shares of the Kansas City Power & Light Company, and not less than 75 per cent of the common shares and a substantial interest in the preferred shares of the Columbus Railway, Power & Light Company, and to provide funds for the acquisition of additional securities of controlled companies.

Personal Items

James G. Nellis Succeeds Charles F. Teagle at Schenectady

Charles F. Teagle, who has held the position of superintendent of transportation of the Schenectady Railway, Schenectady, N. Y., for the past four years, tendered his resignation to the president on Oct. 1. Mr. Teagle will not sever his connection with the company until about Oct. 15.

James G. Nellis will succeed Mr. Teagle, with the title of superintendent, on Oct. 20. Mr. Nellis comes from Auburn, N. Y., where he has been superintendent of the Auburn & Syracuse Electric Railroad for some years past. He is no stranger to Schenectady as he was formerly a division superintendent with the Fonda, Johnstown & Gloversville Railroad at Amsterdam, N. Y. He was at one time manager of the Quincy division of the Eastern Massachusetts Street Railway. He joints the official ranks of the Schenectady Railway with a record of accomplishment in the electric railroad field, which he entered in 1893 with the Cayadutta Electric Railway.

L. V. Sutton, for the past twelve years connected with the Carolina Power & Light Company, Raleigh, N. C., has been appointed assistant general manager of the Arkansas Central Power Company, Little Rock, Ark., to succeed H. U. Wallace, who resigned several months ago. Mr. Sutton has assumed his duties as assistant manager. He is a native of Virginia and is a graduate of Virginia Polytechnic Institute. He has made a study of electrical and chemical engineering and after his graduation from the Virginia Polytechnic Institute was employed by the General Electric Company at Lynn, Mass., for two years.

J. Henry Scattergood has been appointed by Governor Pinchot of Pennsylvania a member of the Public Service Commission, succeeding Samuel M. Clement, Jr., who recently resigned. The new commissioner has had experience along banking, insurance and manufacturing lines. He is treasurer of Haverford College and a director of a bank and of several industrial firms. He was one of the founders of the original committee of seventy. For six years he served as registration commissioner of Philadelphia on the original board named in 1906. During the war he was with the Red Cross in France and twice went abroad for the American Friends' Service Commission in post-war relief work. Mr. Scattergood was born in Philadelphia in 1877 and was graduated from Haverford College in 1896.

Raymond S. Tompkins, engaged in the newspaper business for a number of years, has become assistant to the president of the United Railways & Electric Company, Baltimore. Mr. Tompkins has been a member of the staff of the Baltimore *Sun* since 1916 and represented that paper in France during the World War.

Manufactures and the Markets

News of and for Manufacturers—Market and Trade Conditions
A Department Open to Railways and Manufacturers
for Discussion of Manufacturing and Sales Matters

Car Orders Double in Two Years

Number of Electric Railway Vehicles Built in 1923 Was 103 per Cent Greater than in 1921

According to data collected by the Department of Commerce at the biennial census of manufacturers there was a large increase in the production of electric railway cars in 1923, as compared with 1921, the last preceding census year. The total number of such cars, including both passenger cars and freight cars, was 2,882, as against 1,420. An even greater proportionate increase occurred in value, from $10,128,472 in 1921 to $26,184,713 in 1923.

It will be observed that the total number of cars built is considerably smaller than the total number of cars ordered in 1923, which was 4,029, as told in ELECTRIC RAILWAY JOURNAL for Jan. 5, 1924. This difference is accounted for principally by the fact that the government figures are based on the returns sent in by eight manufacturers engaged primarily in the business of building electric railway cars. The figures published in the JOURNAL, on the other hand, include cars built by other manufacturers who were not engaged primarily in this industry and included also cars built by the railways themselves.

Of the eight companies engaged in the manufacture of electric railway cars two each are located in Missouri and Ohio and one each in Illinois, Massachusetts, North Carolina and Pennsylvania. In 1921 this industry was represented by ten establishments, the decrease to eight in 1923 being accounted for by the fact that one establishment went out of business before the beginning of 1923 and that another during that year was engaged primarily in the manufacture of steam railroad equipment. Statistics of the industry are given in the accompanying tables.

GENERAL STATISTICS FOR THE INDUSTRY: 1923 AND 1921

	1923	1921	Per Cent of Increase
Number of establishments	8	10	.....
Wage earners (average number)	3,978	2,912	36.6
Maximum month	Nov. 4,838	Jan. 3,598	.....
Minimum month	Jan. 3,271	Dec. 2,304	.....
Per cent of maximum	67.6	64.0	.....
Wages	$5,880,773	$3,199,145	83.8
Cost of materials (including fuel)	$17,312,194	$7,880,405	119.7
Products, total value	$29,074,062	$14,856,068	95.7
Value added by manufacture	$11,761,868	$6,975,663	68.6
Horsepower	10,028	Not reported	.....
Coal consumed (tons of 2,000 lb.)	44,630	Not reported	.....

NUMBER AND VALUE OF CARS BUILT: 1923 AND 1921

	1923	1921	Per Cent of Increase
Electric railroad cars			
Number	2,882	1,420	103.0
Value	$26,184,713	$10,128,472	158.5
Passenger			
Number	2,767	1,358	103.8
Value	$25,695,757	$9,525,402	169.8
Freight and other varieties			
Number	115	62	85.5
Value	$488,956	$603,070	—18.9
All other products (includes value of rebuilt cars)	$207,485,685	$153,633,097	35.1

Comparative Labor Statistics for Ten-Year Period

Startling figures are given in a study of labor wages from July, 1914, to July, 1924, by the National Industrial Conference Board, New York. The board reports that in twenty-three leading manufacturing industries covering, on the average, 700,000 employees, wages show an advance of 127.3 per cent, and taking the relation of the changes in earnings to the change in the cost of living from the common base of July, 1914, the figures show that the wage earner in these industries is 27 per cent better off today than he was in July, 1914. The drop in the cost of living from the high peak of 1920 has been considerably greater in proportion than the drop in wages from the same high peak. Consequently, the purchasing power of the dollar is greater than it was.

Less striking but still of considerable significance are the changes in employment and hours of work. Employment in identical manufacturing plants throughout the period advanced 12 per cent between July, 1914, and June, 1924. This is a remarkable indication of expansion when it is remembered that employment in June of this year was at a low ebb, being 25 per cent lower than in June, 1920.

The average work week has dropped more than five hours during this ten-year period. The average nominal or full-time work week in July, 1914, was fifty-five hours, but with June of this year it had dropped to 49.9 hours. In the same way the average work week per wage earner declined from 51.4 hours in July, 1914, to 45.4 hours in June, 1924. In connection with the latter figure, it should be remembered that manufacturing activity was considerably below normal in June of this year and consequently the average week per wage earner is lower than the normal work-week of this general period.

Register Business at Peak

An interesting light is thrown upon the present status of the electric railway industry by a recent statement of John F. Ohmer, president Ohmer Fare Register Company. More Ohmer registers are being sold to railways at the present time, according to Mr. Ohmer, than ever before in the history of his company. This is in addition to large purchases of registers for buses and other recording devices made by this manufacturer.

Power Show Coming

The Third National Exposition of Power and Mechanical Engineering will be held in the Grand Central Palace, New York, from Dec. 1 to 6, 1924. The large increase in the use of the individual motor drive on machine tools has led the managers of the show to make a special effort to bring a group of manufacturers of modern economical motor-driven machine tools into the show as an object lesson of what can be accomplished in securing savings by the greater use of the electric motor in general manufacturing. Exhibits of bearings, couplings, belting and belt drives and gearing will be extended and elaborated at the coming exposition in New York.

Rolling Stock

Interstate Public Service Company, Indianapolis, Ind., to perfect its coal transportation plans, will purchase 100 new gondola coal cars. The company also has included in its 1925 program for development the purchase of additional rolling stock equipment, part of which will be 40 new freight cars, 20 box cars and the same number of flat cars. This equipment was deemed necessary to care for the expected increase in general freight traffic.

Metal, Coal and Material Prices

Metals—New York	Oct. 7, 1924
Copper, electrolytic, cents per lb.	12.875
Copper wire base, cents per lb.	15.125
Lead, cents per lb.	7.80
Zinc, cents per lb.	6.56
Tin, Straits, cents per lb.	49.375
Bituminous Coal f.o.b. Mines	
Smokeless mine run, f.o.b. vessel, Hampton Roads, gross tons	$4.275
Somerset mine run, Boston, net tons	2.075
Pittsburgh mine run, Pittsburgh, net tons.	1.875
Franklin, Ill., screenings, Chicago, net tons	1.375
Central, Ill., screenings, Chicago, net tons	1.175
Kansas screenings, Kansas City, net tons.	2.35
Materials	
Rubber-covered wire, N. Y., No. 14, per 1,000 ft.	$5.25
Weatherproof wire base, N. Y., cents per lb.	17.75
Cement, Chicago net prices, without bags.	2.20
Linseed oil (5-lb. lots), N. Y., per gal.	1.03
White lead, in oil (100-lb. keg), N. Y., cents per lb., carload lots	0.12
Turpentine (bbl. lots), N. Y., per gal.	0.88

Modernization Taking Place in Accounting Practice

ONE of the most important subjects given consideration by the Accountants' Association at its recent convention, that of cost accounting, was covered in a comprehensive paper by Henry S. Day of the Westinghouse organization. In his paper, Mr. Day brought out the advantages to the operating man of a cost accounting system which will reflect, to as accurate a degree as possible, the expense of operating and maintaining various property units. It was the thought of some members of the association, as was evidenced by the discussion, that the installation of such systems might require certain revisions in the accounting methods at present in use in determining operating expenses, but it is generally agreed that the subject should be given some thought. The advantages to the operating department of even a simple cost accounting system, particularly when operating data pertaining to bus operation is being compared with similar railway statistics, are quite apparent. In connection with this subject, the suggestions made for consideration of similar studies on fixed capital and plant inventory records are also worthy of favorable comment.

It was the general opinion among the members of the Accountants' Association that the report of the stores accounting committee was the best ever presented to the association on the subject. The suggestions on harmonizing the stores records with the general ledger are of particular value. Inventories are too often compared with records which are not in agreement with the general accounts, and it goes without saying that proper control of the company's investment in materials cannot be obtained until the physical inventory and the financial records are known to contain the same elements.

During the coming year the Accountants' Association is planning to give particular attention to a number of new subjects, particularly bus accounting and cost records. Its work will continue to be of value to the industry and the association should receive all the assistance and encouragement possible.

Classification of Bus Accounts to Be Studied

THE adoption of a uniform classification of bus accounts is a subject of interest to any electric railway operator, regardless of his present policies in connection with bus operations. As was pointed out in an editorial in *Bus Transportation* for September, at present it is extremely difficult to secure satisfactory comparative operating data, since there are so many different accounting classifications in use. As a result, the various items of direct and indirect expense are subjected to all kinds of interpretations. As an illustration, the costs per mile sometimes quoted by various manufacturers and operators show differences of 100 per cent or more. Under such conditions, electric railways already operating buses cannot obtain figures from other operators which correspond with their own, while companies contemplating bus operation are at a disadvantage when attempting to secure the advance information which is so vital to them. It might also be said that the operating costs of electric railway properties where buses are neither operated nor contemplated should not be compared with bus operating costs unless they contain the same elements, and even then care should be used to prevent drawing erroneous conclusions.

The action of the American Electric Railway Accountants' Association in assigning this work to a special committee, of which M. W. Glover of the West Penn Railways is chairman, is of particular interest at this time, when a number of companies are considering the operation of buses. The executives of these companies should receive the benefit of the best and most comprehensive operating data obtainable. This study should cover not only the revenues and details of operating expenses, but also property costs, taxes, obsolescence, changes in standards and other similar subjects considered during recent years by the electric railway industry.

There is a large field for constructive work ahead, and it will be to the advantage of the electric railway industry, the bus manufacturers and the bus operators if the committee to which this subject has been assigned is given full co-operation by member companies.

Physicians and Surgeons Hold Session at Claims Convention

THE wide range of subjects closely related to electric railway operation was again instanced in the session by physicians and surgeons at the Atlantic City convention. Occasionally in the past a member of the medical profession has been asked to present a paper before the Claims Association, usually on some topic connected with damage claims, so that the claims representatives present could have an aspect of the medical side of the injuries for which suit is often brought.

Some of the papers presented at the session on Oct. 7 were of this nature, but others showed the growing closer interest which railway companies must take in medical matters in connection with their personnel work. This includes not only the medical and surgical care of the men, so that they can be kept in good condition, but similar care extended also to their families by the company.

A natural step in this medical work is periodical examinations, a topic discussed by two papers at the convention.

While the theoretical justice of such examinations will be admitted by the employees, those who have cause to fear rejection will be apprehensive and will oppose the idea. This is undoubtedly one reason why re-examination is not more general. But, after all, as was brought out at the meeting, the medical examination is for the benefit of the men quite as much as for the company. If a man has a defect, it can often be cured if taken in time. If not curable the men should understand that everything will be done which is possible to keep them in the service in less responsible positions. There should also always be a chance of a medical appeal from the verdict of the examining physician.

Periodical re-examinations of trainmen are bound to come, particularly on those railways where operating conditions are severe, and there is consequently much danger from the physical failure of the trainman. The Claims Association is to be congratulated upon developing facts upon this subject.

Electric Locomotive Manufacturers Now on Common Ground

TWO significant announcements in the heavy traction field were released for publication this week, and appear elsewhere in this issue. The first is that the New York, New Haven & Hartford Railroad has contracted with the General Electric Company for seven locomotives of a new design to operate on the New Haven's 11,000-volt, single-phase system; the other is the first comprehensive description of the electrical features of the Ford-Westinghouse locomotives being built for the Detroit & Ironton Railroad, which will be used on a 22,000-volt, single-phase system.

While both of the new locomotives described are somewhat radical departures from anything yet built they both will utilize the same type of electrical equipment. Each will take current from a single-phase contact line and step it down through transformers, after which it will be converted to direct current by means of synchronous motor-generator sets. In both cases propulsion motors of the familiar d.c. series type will be employed.

These announcements are of great import in the progress of railroad electrification. The division of opinion regarding the relative merits of the different systems, which has given rise to serious controversy at times, has held back electrification. Steam railroad executives have felt that if electrical engineers and manufacturers could not agree, it was undesirable to proceed with the expenditure of such large sums of money. This was pointed out in an editorial in this paper for Jan. 6, 1923, in which the further statement was made that signs pointed toward a realization by the manufacturers of the deterrent effect of the controversy, and that developments might be expected along the lines which have now taken shape in these latest locomotives. While these developments have taken longer than was anticipated at that time, the progress made is noteworthy, and it is hoped will be but the forerunner of greatly increased activity in railroad electrification.

It has come to be more or less generally accepted in both schools of electrification opinion that the single-phase a.c. system is most advantageous for distribution, and that the rugged series d.c. motor is the most satisfactory propulsion unit. Thus, the latest locomotives of both the General Electric and the Westinghouse companies embody what may be said to be the best features of both the principal systems of electrification heretofore employed. If they work out satisfactorily in practice, and there seems to be no reason why they should not, they offer one basis on which both manufacturers may be ready to compete for the business of electrifying any railway where an a.c. distribution is considered essential by the purchaser or his experts.

Control Features of New Locomotives Are Not New

THERE is nothing fundamentally new in the form of control used in these new a.c.-d.c. locomotives for the New Haven and the D. & I. roads. The direct current from the motor-generator is fed directly to the propulsion motors without the interposition of resistance, as is customary in d.c. traction. Instead, there is a voltage control obtained by varying the field of the generator, making it unnecessary to waste energy while starting or when operating at reduced speeds. Such a system was first proposed by H. Ward Leonard before the American Institute of Electrical Engineers in 1892, and described in the *Street Railway Journal* for July of that year—over 32 years ago. The need for a control of this type did not arise, however, and it never came into commercial use. In fact, not a locomotive using the principle was built in this country prior to the present orders.

The original Ward Leonard control was planned for use with a direct-current supply system, so that the only advantage was in the perfection of speed control obtainable. This was offset by the excess weight of equipment, so that some form of series-parallel control always has been considered superior for straight d.c. work. In the present adaptation to the single-phase contact line, practically the only refinement introduced is the provision for separate excitation of the propulsion motor fields to permit control of the rate of regeneration, and the substitution of a single-phase synchronous motor for a d.c. shunt motor to drive the motor-generator set.

Some have said that this new type of locomotive is universal in that it can be interchanged among railroads electrified with either the direct-current or single-phase system. This is true provided the locomotive is equipped with the standard series-parallel control apparatus for operation with a 600-volt d.c. overhead, in addition to the motor-generator control equipment. But the present-day commutator type single-phase motors may also be operated on d.c. lines, provided the locomotives are supplied with d.c. control equipment. Thus, the universality of use is not a feature exclusive to the motor-generator type locomotive. For example, all of the New Haven passenger locomotives are arranged for operation on either form of current. However, the complication of providing a complete changeover of connections to the motors when transferring from one system to the other has been one of the serious handicaps with which the New Haven has had to contend. This difficulty would also apply to the motor-generator type locomotive if it were undertaken to make it universal.

The Brief that Won the 1924 Charles A. Coffin Prize

The story is told by the railway of the work it has done in all phases of its operation to merit the distinction which it has won — The advertising done to create traffic and the various measures employed to build good will stand out as the chief contributions to the industry — Many modernization steps have also been taken which have successively improved the cost side of the operation and brought the operating ratio down to the low figure of 61 per cent — A story worthy of study by every railway management.

By the Northern Texas Traction Company

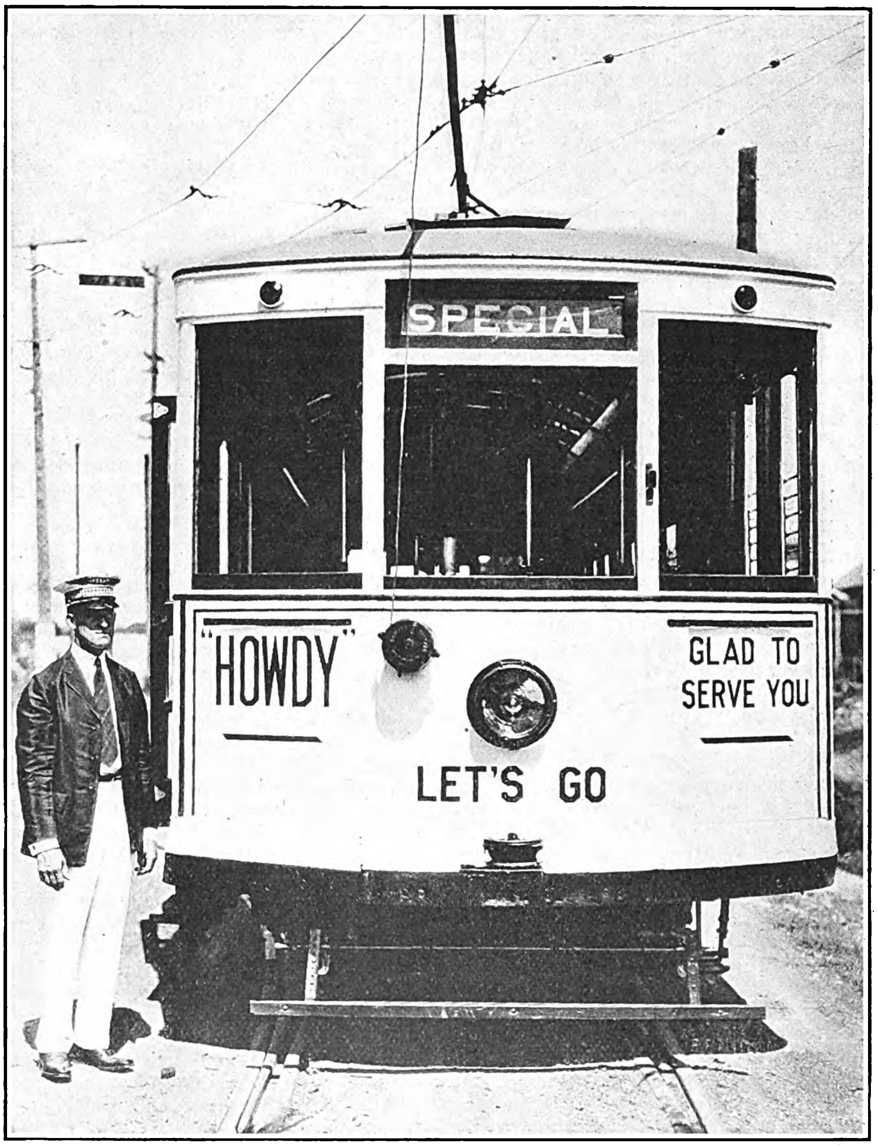
Fort Worth, Tex.

THE Northern Texas Traction Company operates all the street railway service in the city of Fort Worth, Tex. It also operates an interurban railway between Fort Worth and Dallas, a distance of 34 miles, providing a high-speed, frequent service between these two cities of 150,000 and 200,000 inhabitants respectively. The Fort Worth-Dallas interurban line also furnishes transportation service to people located in the towns between the terminal points, including Handley, Arlington, Dalworth and Grand Prairie.

Under the name of the Tarrant County Traction Company, but with the same personnel, we operate a high-speed interurban line between Fort Worth and Cleburne, Tex., a distance of 32 miles. We also do the lighting and power business in the smaller communities served by our interurban lines, but we do not do any of the lighting and power business in the terminal cities.

The company owns 177 miles of equivalent single track, 192 city and 58 interurban cars. Our power house has a capacity of 11,000 kw. and we operate seven substations. Our organization personnel totals 750 men and women.

The public relations and standing of the Northern Texas Traction Company in the community it serves are the best. In spite of increasing cost and private automobile competition, this company, by paying rigid attention to all details of operation, has kept its ratio of operating expense to gross revenue down to the low figure of 61 per cent for the year. During the year ended Dec. 31, 1923, this company built and put into operation 6.65 miles of city track, which gives it the distinction of having made the largest extension of new lines of any company operating in a city of this size, and also of making the third largest track extension of any street railway company in the United States, being surpassed only by the extensions made by the Twin City Rapid Transit Company, Minneapolis, and by the city of Detroit.



Front of One of the White "Talking" Cars Used Effectively for Advertising Purposes by the Fort Worth Company. Note the "Natty" Uniform Worn by the Operators of These Two Cars

Popularizing Railway Service

The ways in which this company uses initiative, skill and enterprise to popularize electric railway service are many and varied. A great deal of the popularity of our service, both city and interurban, is due to the loyalty of employees, who are constantly striving to give that touch of personal service in their contact with the public which is so essential in present-day practice.

This company keeps a close check on the transportation needs of the community served by it, and the service rendered is based upon the fundamental policy of providing short headways and anticipating the public's requirements.

There is little doubt that the popularity of our electric railway service has been the means of maintaining a high per capita riding in the face of the ever-increasing use of the private automobile. Business is created by this company, and, in doing this, we do not hesitate to use every legitimate means at our command. This company has a product to sell—transportation. We use up-to-date and novel sales methods in order to sell it. We believe we have shown much initiative, skill and enterprise in popularizing electric railway service. Illustrative of this are the different methods used to bring our merchandise to the attention of the buyers. Such methods include the poster campaign, newspaper advertising, white "talking" cars, etc., all supported by a high-class service.

It is conceded by those who have anything to do with the advertising for this company that the outstanding piece of advertising done, aside from the general newspaper and car card advertising, was the placing in regular service of two white "talking" cars. One of these cars was a double-truck, one-man car, and the other a single-truck, standard Birney car, the two types being selected to impress upon the public mind the kinds of cars now representing the latest standards. The bodies of these cars were painted a dazzling white. The trucks were painted black and the window sash finished in mahogany. Appropriate statements were painted in black on the side sheeting and letterboards, as well as on the dashes. The wording on the dash, common to both ends of each car, was as seen in the accompanying picture.

"Ride the Street Cars and Save the Difference" occupies the full length of the letterboard on each side. On one side of each car appeared "Our Service Is a Shopping Convenience" and "You Don't Have to Park Your Street Car." Between these two signs were the words "Think It Over." On the opposite side of each car the signs read:

"The Convenience of Our Service Is Increasing Daily."

"We Appreciate Your Patronage."

The words "Think It Over" were repeated between these two messages.

Regular trainmen instructors were selected to operate these cars, and they were furnished with special uniforms to emphasize the distinctiveness of the white cars. White caps, similar to those worn by police officers, with the word "Operator" in gold braid across the front; white shirt and collar, black silk coat, white flannel trousers and black shoes made up the uniform. It is needless to state that these men looked mighty fine in these outfits and that they were highly complimented upon their appearance by hundreds of their patrons.

Both cars were operated in regular schedule over the different lines in the city, carrying their share of the riding public. They were kept in service exactly one month. They were withdrawn from service for only one reason, namely, to change the outside wording.

When the cars made their initial appearance, newspapers were enlisted to explain to the public their purpose. Advertisements were run from time to time to advise the readers as to the routing of the cars. One of these advertisements is reproduced on another page of this issue.

As an additional aid in making the white car advertising scheme an absolute success, dash signs calling attention to the white cars were carried on all other cars operating in the city. The wording on these signs was as follows:

"Do You Believe What the White Cars Say?"

"A Memory Test—Can You Repeat What the White Cars Say?"

On the first day the cars appeared, and for several days thereafter, people would congregate on the street corners in order to read the messages of the cars as they pulled up to load or unload passengers. And during the entire time they were in operation the public never stopped commenting upon them. It was practically impossible, for example, to go into any public gathering, such as a noon-day luncheon, without hearing some favorable mention made of the white cars.

When we put out the dash sign asking the public if it could repeat what the white cars say, it was not long before the question was a popular greeting. A man, for example, would meet a friend on the street and greet him somewhat like this: "Hello, Bill, can you repeat what the white cars say?" Usually there followed a friendly contest between the two to ascertain which one had the better memory.

Local newspapers carried feature stories and photographs of the cars, dealing with them in the most friendly manner. The cars have now been out of service about one month, but there is still popular discussion about them. It is impossible to determine the direct benefit derived, but we do know that as the result of the operation of these cars, many people were attracted to our service.

DASH POSTERS EFFECTIVELY USED

While the above mentioned campaign of advertising to popularize our service was going on, we also realized that a poster on the dash of our city cars would be a very desirable way to advertise for new business. A dash sign is practically a traveling billboard and it can be used very effectively to put over an idea. We have done this by appealing to the automobile owners to "Ride the Street Cars and Save the Difference." These dash posters are changed every ten days, so that a new message is frequently placed before the public. The dash advertising is based on two fundamental ideas: First, that our service is convenient, and, second, that it is economical. Every one of these dash posters carries a definite message calculated to make the automobilist see the advantage he will gain in convenience and economy by using the street cars.

That the "Save the Difference" campaign is a success is best testified to by the number of people who, to our personal knowledge, now ride the street cars to and from home and their places of business. The slogan is often heard on the streets of Fort Worth. People when asked what they are going to do when they intend to board a street car will say, "I'm going to save the difference."

Whenever something out of the ordinary is going on in the city, we also use dash posters to invite the public to use the street cars. For example, two days before Easter Sunday we ran a special poster with the following message: "Let Us Take You to Church Easter Sunday." Incidentally, the ministers of the city were pleased with this.

While dash sign advertising has been practiced by many companies for years, the effectiveness of the campaign as conducted by this company is directly attributable to the thought and originality of the copy used. It has resulted in attracting many riders to the street cars. Following are some of the slogans used on the dash posters:

"Ride the Street Cars and Save the Difference."

"You Don't Have to Park Your Street Cars—Save the Difference."

"Are You Saving the Difference the Street-Car Way?"

"Don't You Agree that the Difference Is Worth Saving?"

"Get Acquainted With Your Neighbor; Ride the Street Cars."

"Your Neighbor Rides the Street Cars and Saves the Difference, Why Don't You?"

"You Won't Have to Park Your Street Cars During the Stock Show."

"Ride the Street Cars; Build a Home With the Difference."

"Going to Dallas? Ride the Interurban and Save the Difference."

"There Is a Difference! Save It on the Street Cars."

"Own a Home First."

"Our Service Is an Economic Convenience."

"Our Service Is a Shopping Convenience."

"Howdy, Folks—Can You Repeat What the White Cars Say?"

INTERIOR CAR CARDS CARRY ON THE THOUGHT OF THE DASH POSTERS

The fact that people are on the street cars is no reason why we should not appeal to them through advertising copy placed inside the cars. We do this by means of car cards located at each end of the body, so that one of the cards faces the passengers at all times. The wording on these cards is linked up with the dash posters. These interior car cards, as well as the dash posters, are changed about every ten days.

The interior car cards on the city cars carry a direct appeal to the people of Fort Worth, whereas those on the interurban carry a different story directed to travelers, many of whom do not live in our territory. Examples of the copy used on the interior car cards follow:

"Howdy—We Are Glad to See that You Are Saving the Difference Today. Do It Again Tomorrow."

"Good Morning, Neighbor! Let's Get Acquainted Today So We Will Know Each Other When We Take the Street Car Tomorrow."

"Your Neighbors Have No Parking Troubles—They Ride the Street Cars and Save the Difference Not Only Today, But Every Day. Why Don't You?"

"Own Your Own Home. There Is Room for 20,000 More Homes Along Our Car Lines. Systematic Saving Makes Home Ownership Possible. Ride the Street Cars and Save the Difference."

"Build a Home First—On One of the 20,000 Available Residence Lots Now

Served by Our Car Lines—With the Difference."

"The Value of Our Service to You, As a Shopping Convenience, Is Increasing Daily—We Appreciate Your Patronage."

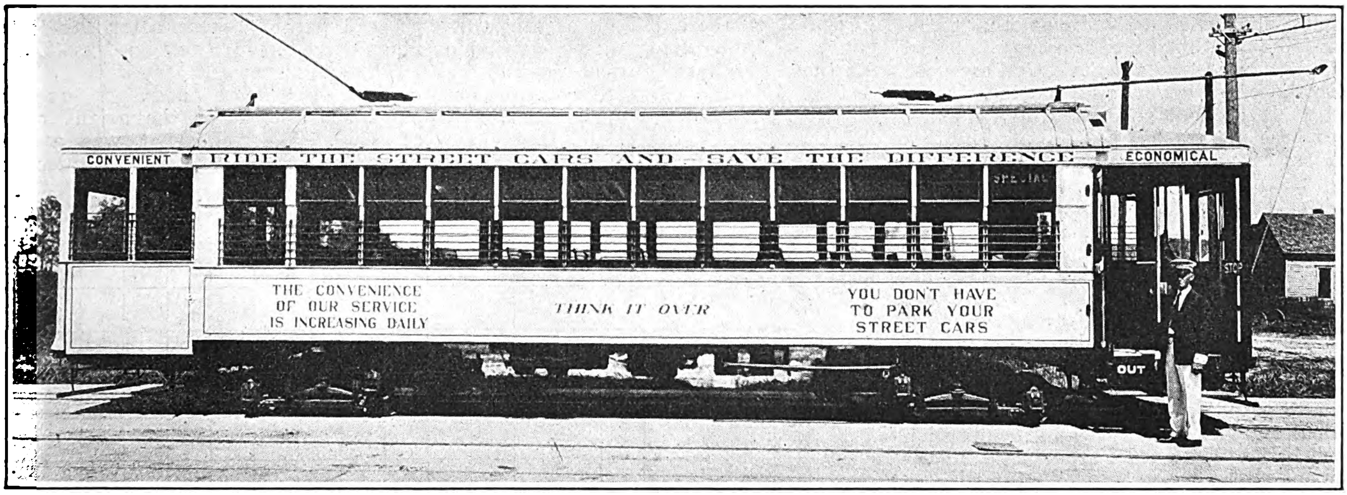
"Don't Forget that Round-Trip Tickets Save You 10 per Cent. Buy Them and Bank the Difference."

"This Train Is Propelled by Electricity—But Is Operated for Your Convenience, With Courtesy and Safety."

DEVELOPMENT OF SHORT-HAUL REAL ESTATE

It is the usual course of events in growing cities for real estate men to promote new residential additions remote from the street car lines, and then start agitation for a street car line to the new addition without inquiring as to the unjust burden it might put upon the street railway company. This company has not been without this source of annoyance in Fort Worth. Due to the activities of real estate promoters, this company in the past built and extended some of its lines until the point was reached where the length of haul became so long that a few lines have shown a deficit.

About a year ago we cast about for some means of checking, at least for the present, this selfish desire on the part of new addition promoters. We made an accurate count of all vacant residential building lots within four blocks in any direction from all our city lines. This count established the fact that there were more than 24,000 vacant residential building lots within four blocks of street railway lines. We limited the territory canvassed to four blocks in either direction from a car line, as we figure that is about the maximum distance, under urban conditions, that a person would care to live away from a car line.



CONVENIENT

STOP
OUT

This Shows the Wording Painted on the Side of the Double-Truck One-Man White "Talking" Car

When we secured this information we put it out to the public both by interior car cards and newspaper advertising. In this advertising we used the figure of 20,000 lots instead of 24,000 as the count showed, in order to be conservative. The campaign has had the desired results, as it has brought incontrovertible facts before the public that this company has anticipated its needs long in advance and that with the abundance of building lots adjacent to the street railway lines it is an imposition to ask us to build and extend lines, as our present lines will serve a city of 100,000 more people than we now have.

The result of our efforts is that building lots adjacent to our car lines are booming and the development of short-haul real estate is successfully under way.

NEWSPAPER ADVERTISING TIES IN

We believe in newspaper advertising based on strictly business lines. By that, we mean that we advertise our service at opportune times and not when the newspapers request us to. We do not hesitate to tell the public what we have to offer in the way of service. At times we use big "smash" advertisements and at other times we use smaller ads, all depending on the message to be delivered. Our appropriation for newspaper advertising amounts to about one-half of 1 per cent of our gross revenue.

This newspaper advertising carries two dominant ideas: First, that the service is dependable, safe and economical; and, second, it follows out the "Save the Difference" message and the convenience of our service. This advertising is often tied in with the promotion of real estate additions, the opening of a new street car line, the opening of the baseball season, or special feature sections got out by the newspapers.

We advertise our city and interurban service in all three of the Fort Worth daily newspapers. In addition, we advertise in labor and church weeklies. We also advertise our interurban service in the Dallas dailies, and in 100 weekly newspapers within the Fort Worth trade territory.

100 PER CENT SAFETY CARS ADD TO POPULARITY

This company prides itself on having pioneered the way with one-man safety cars, we having been the first company to completely equip one line with Birney safety cars. Since this original installation back in 1916, we have gradually added one-man single and double-truck cars to all our city lines until at the present time all our city service in Fort Worth, requiring some 200 cars, is one-man operated.

We believe that Fort Worth is one of the few cities of more than 150,000 population which can boast of 100 per cent one-man operated street cars. Of course, this company has gradually brought about the one-man operation over a period of eight years. By so doing, we have completely sold the public on the idea because we have shortened the headway and increased the schedule speed on all lines, until now it is frequently said that Fort Worth has the best street railway service in proportion to its size of any city in the country.

The change to one-man operation has been accomplished without laying off any men, due to the fact that the increased service rendered has provided a place for all. All the car operators are enthusiastic over one-man operation and they would not care to revert to two-man operation of cars.

SPECIAL ADVERTISING PRACTICES

Always having in mind the idea of more riders and more revenue, we never hesitate to take advantage of large public gatherings to have unique exhibits. In the fall of each year a state fair is held in Dallas. This fair attracts people from all over the state, and, as a consequence, our Fort Worth-Dallas interurban and Fort Worth-Cleburne interurban lines benefit by increased riding. Naturally, we are interested in the success of this fair. We always take space and utilize it to promote electric railway riding, as well as to further our safety campaign. The annual Fat Stock Show and Southwestern Exposition which takes place in Fort Worth in the spring is another opportunity which is utilized in the same way.

This company employs a general passenger agent, one of whose duties is to secure special car business over either the interurban or city lines. He has been very successful in securing a good many special car and train movements per month. A good deal of this success is due, we believe, to our practice of hanging large signs on the sides of the special cars or trains which tell who it is that is traveling by special car, and where the party is going. Incidentally, parties hiring special cars like the idea, as it attracts attention to them. These signs are placed on the cars by the company free of charge, as it is good publicity for us.

Every day on which the Fort

Worth "Panthers" of the Texas Baseball League play at home we run a special street car around the city with large signs on either side of it, calling attention to the baseball game that afternoon, and also soliciting the patronage of the fans to and from the baseball park.

This car runs over a definite route while it carries the baseball advertising. It is operated this way for 2¼ hours, after which the banners are taken down, and this car goes into regular tripper service between the business section of the city and the ball park. Thus, the non-revenue car-miles operated by this car are kept small, and its advertising value more than makes up for the cost.

Among other things used to sustain the popularity of our service are painted billboards located in strategic positions, some of these boards being illuminated at night. We rent these boards from a local advertising concern. The copy is changed every three months. At times, the copy on all boards is the same, while at other times it is varied, but all of the copy is based on the same fundamentals that are used in the other advertising matter.

It is difficult to ascertain the exact amount of new business created by this form of advertising, but we do at times get evidence of good will or riding stimulated by the billboards.

We constantly try to be original with our advertising, as we think it is the out of the ordinary which attracts attention. During March of this year several business institutions in Fort Worth, including ourselves, contributed to an advertising display which was on exhibition for two weeks in one of the show windows of a leading furniture dealer. This display was in connection with the "Forward Fort Worth" movement. The theme was a miniature of part of one of our downtown streets. Automobile trucks and street cars and other street traffic were mounted on a moving belt. Each of the firms contributing to this display used the space allotted for advertising purposes. This company had two small street cars on the moving belt. On the sides of each car were small signs about the "Save the Difference" and "Get Acquainted With Your Neighbor" ideas. This advertising display attracted a great deal of attention both during the day time and at night.

Dash Destination Signs

All the cars of this company have illuminated route sign boxes installed in the upper right-hand corner of the front and immediately to the left of the entrance. In addition to these illuminated route signs, for use on cars which do not go through to the end of the line, a special destination sign is carried on the dash as a means to avoid having passengers get on the wrong car. These signs are 12 in. x 20 in. in size, and are made of sheet iron. They are supported on the dash by means of two hooks which engage in loops on the dash. A color scheme is also used in addition to the lettering to help differentiate between cars turned back at different points. The color scheme worked out for a line with four turnback points is as follows:

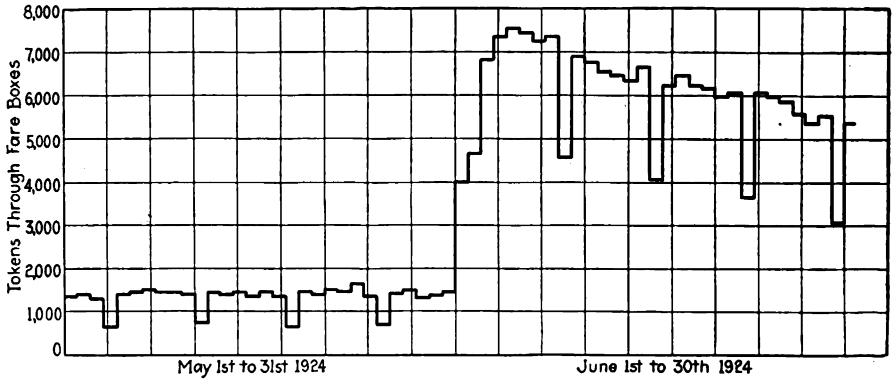
1. White background and black letters, besides denoting the destination of the car, signifies that its destination is the first turnback point on the line.
2. Red background and white letters signifies that the destination is the second turnback point on the line.
3. Green background and white letters, the third turnback point.
4. Black background and white letters signifies that the destination is the end of the line.

While the idea of dash destination signs is not new to the street railway industry, we believe that the color scheme of dash destination signs, as now used by this company, is a new and novel, as well as useful, adaptation of them. These signs have assisted prospective passengers to distinguish their car at a distance and have greatly reduced the necessity for transferring passengers who had boarded the wrong car.

How Token Use Was Increased by Five Times Overnight

Since the inauguration of an odd fare (7 cents) on the city lines of this company, we have had tokens available for those who cared to use them at the cost of 7 cents each without reduction in price. We did not push the sale of the tokens with the result that little use was made of them.

During the early part of 1924 we increased the schedule speed of our cars to a maximum. Upon doing this we decided to try to get the public to use tokens and thus relieve change making on the operator as much as possible. We also came to the conclusion that if we could get tokens out to the public there would be more street car riding for the reason that anyone would part with a token easier than he would with 7 cents in cash.



Graphic Illustration of How the Sale of Tokens Jumped Overnight to Five Times the Former Level

Another reason for desiring greater use of tokens was the installation of traffic control signals in the business district. If everyone used tokens, the operators' job would be easier and the car delayed less; a second's delay sometimes meant a delay of 45 seconds due to traffic being given the signal to move on cross streets.

With the idea in mind of increasing the sale of tokens, we started in to find out why the public did not use more of them. The reason seemed to be that people were afraid they would lose the tokens because they would be scattered loosely in their pockets. The solution seemed to be to give the people something in which or on which to keep tokens. After investigating we finally decided to give away split rings on which tokens could be kept.

On May 31, 1924, the men on our city cars gave every passenger who boarded the cars one of these rings contained in a small envelope. Printed on the envelope were the reasons why the use of tokens would benefit the passengers. About 35,000 of these rings were given away between 5 a.m. and 2 p.m. All the operators were supplied with tokens and every effort made to sell them. The results exceeded our expectations.

Before these token rings were given away, the number of full-fare tokens which went through the fare boxes averaged between 1,300 and 1,400 per day. After the rings were given away and an effort made to sell tokens the number of full fare tokens going through our fare boxes immediately jumped to an average of between 6,000 and 7,000 daily. The chart reproduced herewith showing full fare tokens taken in daily from May 1 to June 30, inclusive, vividly illustrates the increased use of tokens after the token rings were given away on May 31.

The rings cost 1¼ cents each. We ordered 40,000 of them. Rings and envelopes cost us in the neighborhood of $600. We believe it was a well made investment and a good piece of advertising.

We have popularized our service to the extent that we have made it easy to carry tokens and have made the tokens easy to buy, as all trainmen have them for sale and they also may be bought at our ticket offices. The increased sale of tokens has increased the number of our riders and in addition has provided a means of forcibly impressing upon the trainmen that they are the salesmen of the company's product —transportation.

Paint Cars Every Nine Months

We believe in frequent painting of cars as a means of attracting patronage. During the year we have completed our program of repainting every car on the system, both inside and out. On the city cars it was formerly our practice to paint one-man cars palmetto green, but we have discarded this practice and now paint all city cars cadmium yellow, as we believe the latter to be more noticeable.

Since the completion of our new paint shop, we have perfected a painting schedule whereby every car on the system will get into the paint shop once every nine months. This frequent painting keeps our cars looking clean and fresh and has caused considerable favorable comment.

SOMETHING DOING ALL THE TIME

This company does not believe in letting the people of this community forget that there is a street railway company. We are constantly doing something that is real news.

When we completed our new paint shop we entertained the Fort Worth Salesmanship Club at a luncheon in this building. Of course, this gave us the opportunity to conduct all present at the luncheon through the shops and barn and thus explain what it takes to keep up a street railway system.

On other occasions members of this company give talks before luncheon clubs on street railway problems and situations. At other times the traction company will put on all the entertainment at a noonday luncheon club. For this purpose, a number of our talented employees are organized and they never fail to put on an entertaining program which reacts to the company's benefit. Whenever we open a new car line, or finish some big improvement, we stage a celebration to commemorate the inauguration of better service to the public.

We try to be original in our advertising, so much so that the people of Fort Worth often ask, "What will they pull next?"

We believe in boosting for the towns and cities to which we render service by contributing as liberally as possible to all worthy causes, whether it be for charity, buying stock in a new enterprise, such as a new hotel, cotton mill or other civic betterment. In other words, we are counted on as being live wires in this community, and we try to live up to this reputation.

Gaining Public Good Will

We have the public good will in our territory, and all that we have done this year is in line with our policy of being good citizens of the community and such as to continue to merit the good will we now enjoy.

We co-operate with the newspapers in our territory and give them any necessary information they may desire. This company does things which the public and the newspapers are quick to notice and the result is that we receive a large amount of publicity in newspaper stories, which are very beneficial to success in gaining and keeping public good will.

We do not use a press agent to create newspaper publicity for this company; we do not need one; we are constantly doing new things and creating legitimate news which the newspapers are glad to run as news items.

One of the secrets of our success in gaining public good will is to furnish street railway transportation to growing, outlying sections of the city. During the year we built and put into operation the Riverside line, which runs from the business district to the Riverside section of Fort Worth.

While this line was being constructed we ran White buses from the business district to this suburb on a 10-minute headway. The bus fare was the same as the car fare and transfers were issued from one to the other. The daily receipts on this bus line averaged about $50.

When we opened the street car line to Riverside, we withdrew the bus service. The street cars run on a 12-minute headway, but the patronage immediately increased over what it was on the bus line, and the increase has remained steady ever since the opening of the line. The receipts on the Riverside car line average around $110 per day, as contrasted with the bus line receipts of only $50 per day.

That the people of Riverside were happy to be connected with the business section by street railway service is testified to by the reception planned and carried out by the citizens upon the inauguration of service on Jan. 24, 1924.

IT'S A REAL PLEASURE—

To travel over the city's many car lines, and say—

Howdy!

To the thousands of Fort Worth men and women who have shown such sincere interest in the story which we are telling about the convenience and economy of our service.

Today we will be operated over the Lake View-Stockyards and Arlington Heights lines.

WATCH FOR US!

And let us become better acquainted.

Cordially yours,

THE WHITE CARS

OF

NORTHERN TEXAS TRACTION CO.

Our interior messages to you are also very interesting. Read them.

A Typical Piece of Copy Used in Newspaper Advertising in Conjunction with the White "Talking" Cars Stunt

The first car left the business district carrying Mayor Cockrell of Fort Worth, Manager G. H. Clifford of the Northern Texas Traction Company, several other officials of the company, and a score of prominent Riverside citizens. Arriving at the Riverside end of the line, the first car was met by hundreds of Riverside citizens. After several complimentary speeches had been made, the traction company officials were served with coffee and cake by the ladies of the Parent-Teachers' Association. On the day of the opening of this line the Hearst morning newspaper ran a special news section as part of the regular edition, which featured various activities of this company and what the car line meant to Riverside. Of course, the company bought paid advertising in this edition, but the news items and stories ran on the part of the newspaper were of immense value to the company.

On Feb. 25, 1924, another new line, known as the Sycamore Heights line, was opened during a snow storm, which is out of the ordinary in this locality. The fact that we opened the line on schedule, in spite of the snow storm, caused much favorable comment, as it showed that we do things when we say we will. This occasion met with a response from public and newspapers similar to that described for the Riverside line. The Fort Worth *Star-Telegram* got out a special supplement to its regular edition on the day preceding the opening of the line, and this gave us much free publicity.

Much good will was engendered by building a replica of a French box car for the use of a local American Legion organization known as La Société des 40 Hommes et 8 Chevaux. The body was built at cost and the railway donated the truck. The car is hauled around the city during parades and other events and the company charges nothing for the motor car and motorman employed for the purpose.

Another activity which has gained good will is the policy of beautifying the grounds around buildings owned by the company. This was inaugurated two years ago, and so many compliments have been received on the work that we have this year carried it forward on a much more extensive scale than heretofore.

TRAINMEN SCHOOLED IN COURTESY

We have schooled our trainmen in the idea that it is the little things that count and it has brought results from the standpoint of gaining public good will. The company has the reputation of having very courteous trainmen and we annually receive many letters from the public commending this or that act on their part.

Until this year we followed the general practice of holding general meetings of our trainmen; at these meetings the proper care of our patrons was stressed. However, the number of trainmen present was so large that the talks had to be very general. We, therefore, changed to a new policy of holding these meetings by lines, with the meeting in charge of the inspectors of the respective lines. This had two good results: First, it emphasized our policy of treating the inspector as though he was the independent manager of his line, with complete responsibility for it; and, second, since all present were facing the same conditions, the talks and discussions could be more specific. The idea of treating the passenger as though he was a guest has been stressed at these meetings and the results have been very gratifying.

Our power generating station and interurban carhouse are located at Handley, Tex., a small unincorporated village 7 miles east of Fort Worth. This village has no fire-fighting equipment.

Our power station, carhouse and other property at this place are fully equipped with fire-fighting apparatus, including plenty of standard size hose, water and high pressure power pumps.

We have placed all this equipment at the disposal of the citizens of Handley in case of a fire in the village. Many times our employees at this place have laid over a quarter mile of hose and put out a fire, which if not checked might have razed the entire village. Our property is not endangered by a fire in the village because of its isolated position.

Needless to say the free use of our fire-fighting apparatus, together with the efficient work done by our employees in the rôle of fire fighters at times, has resulted in much favorable good will toward this company on the part of the citizens of this community.

COMPANY PARTICIPATION IN CIVIC AFFAIRS

It is a recognized fact that this company is in the forefront of all movements for the development of the city and this policy is the foundation for the public good will we now enjoy. The following are cited as examples of some of the civic events we participated in during the past year.

During November, 1923, the city held a three-day celebration of the 75th anniversary of the founding of the city. The celebration was staged under the name of "The Diamond Jubilee."

The company contributed both money and time to the success of this celebration. Flag decorations were put up on our trolley span wires by our line crews; we worked in conjunction with the general committee so that our cars would not run on streets on which parades were being held. One night during the celebration Alvin Owsley, then national commander of the American Legion, made a speech in Dallas and was scheduled to make a speech in Fort Worth so shortly after his Dallas speech that it would have been impossible to get to Fort Worth in time by our regular interurban service. In line with our policy of being on our toes, we placed a special car at his disposal and brought the commander and his party from Dallas to Fort Worth in the record time of 49 minutes. This one act alone gave us front page newspaper publicity.

During the year the Fort Worth Chamber of Commerce reached a determination that the development of Fort Worth required the enlargement of its manufacturing industries. The manager of this company, together with other prominent citizens, was successful in securing a cotton mill to locate here, contingent upon the residents of Fort Worth subscribing for a substantial block of stock in this mill.

Inasmuch as this company has consistently followed the policy of taking part in all enterprises that would benefit the city, a cash subscription of $10,000 was made in the stock of this new industry. Our attitude in this matter resulted in much favorable comment and confirmed public opinion that we were good citizens. This cotton mill is well on its way to completion and it is expected to be in operation by Sept. 1, 1924.

During the first part of July we decided to get some idea of where the people lived who use our interurban service. We desired to get this information so that we could develop our advertising program in an intelligent manner. In getting this information we only wanted to know where the party lived and his occupation, hence we did not ask for names as they were not essential for our purpose. We decided to get this information by means of cards distributed to the passengers on the interurban trains by the conductor. At the same time we decided also to find out what the patrons of the interurban lines thought about our service, and invited their suggestions and criticisms.

The total number of cards put out to passengers on both local and limited trains was 1,134. Only 9 per cent of this number made any criticism of our service and these were of a minor nature, although in nearly every case of complaint it was due to causes beyond the control of the company. The other 91 per cent of the passengers invariably praised our service and had no fault to find; some of them made suggestions for the betterment of the service, all of which are under consideration.

Among other things done by this company which all tend to gain and keep public good will are the memberships maintained by the company in local civic and luncheon clubs. Members of this organization make it their business to attend club meetings and affairs, and the reaction from this is noticeable in our sustained good will with the citizens of this territory.

We never miss an opportunity of escorting individuals or parties of students through our shops and power house and over the property and explaining the details and thought necessary to provide the transportation for their benefit.

To sum up the story about the good will enjoyed by this company, we have gained it by fair dealings, telling the public our story, and by ever being on the alert to render the relatively small details of service which of themselves may appear unimportant but which in the aggregate make the difference between having good will or not having it.

Taking Advantage of Better Practices and Equipment

From the economies put in practice by this company during the past ten years we are now reaping substantial benefits. The chart reproduced herewith graphically illustrates by car-mile figures the substantial economies now being enjoyed.

The first graph shows the cost of trainmen's wages per car-mile by years from 1918 to the first six months of 1924 inclusive. The period from 1918 to 1920 was one of increasing wages. Since then our trainmen's wages per car-mile have steadily decreased until today the figure is 6.35 cents per car-mile. There has not been any reduction in trainmen's wages. The reduction in trainmen's wages per car-mile has come about solely through economies which have been put into effect, such as the wide adoption of one-man cars and fast schedule speeds.

The second graph shows the kilowatt-hour energy consumption per car-mile over the period from 1918 to the first six months of 1924, inclusive. During the period from 1918 to 1920 we ran a large amount of heavy equipment so that the energy per car-mile averaged around 2.2 kw.-hr. During the period from 1920 to 1921 we added a large amount of light-weight rolling stock. We paid rigid attention to the economies to be effected with coasting clocks, so that since 1921 our energy consumption per car-mile is down to 1.75 kw.-hr. and has remained at this figure to date.

The third graph shows the cost of equipment maintenance per car-mile. This has also shown a material decrease in cost per car-mile due to economies effected by our modernization program. Light-weight rolling stock has been a factor in this. Our program of building new and up-to-date shops, the installation of modern tools and shop equipment, and the educational work carried out with the shop men have all been factors in the steady decline of our equipment maintenance costs from 3.5 to 1.9 cents per car-mile.

The fourth graph shows the cost of maintenance of way and structures per car-mile over the period from 1918 to June, 1924, inclusive. The reduction to the present cost of 1.4 cents per car-mile from the 1920 peak of 2.55 cents per car-mile has been brought about because of the adoption of light-weight rolling stock, the extensive use of track welding equipment and the use of modern track tools.

These reductions in maintenance costs have been achieved in spite of the fact that the wage scale that now prevails on this property is as high as it was in 1920, the standard of maintenance is higher than at that time and the condition of the property has been improved to a material extent.

HEATER CONTROL EFFECTS SAVINGS

All our cars are equipped with electric heaters. Until recently the use of heaters in our cars was carried on without any systematic attempt in regulating when they should be turned on or off. This practice resulted in much waste of electrical energy due to the fact that trainmen would turn the heat on in the morning and then permit it to be on all day in spite of the fact that it might not be needed. Recently we adopted our present system of heater control, from which we are now making a substantial saving in energy used.

At six convenient places in the city we have placed red colored electric lights, known as heater lights. These lights are so placed that at least one of them is passed by cars on every division. When the red light shows it is a signal to all trainmen to turn on their heaters. When the lights are off, it is a signal to all trainmen to turn off the heaters and the division inspectors see that this is done.

The turning on and off of these heater lights is done by the chief inspector, or by some one under his direction. Thus the control of the electric heaters is under one man.

In addition to this, the trainmen report daily on their trip sheets the number of hours the heaters were in use and whether one-half or all the heaters were in use. Knowing as we do the current consumption of the heaters in various types of cars, we compute therefrom the amount of electricity which is used for the electric heaters.

With this system of controlling the heaters, we are saving a considerable sum as compared to our former practice.

EXPANSION OF SHOPS

We are now reaping the benefits of a shop expansion program formulated some four years ago. During this year we completed a new paint shop at our East Front shops. This paint shop is of reinforced concrete construction, with Fenestra sash, thus providing ample light. It is equipped with sprinkler system throughout. Within this new paint shop we can house 10 cars at one time, thus giving us ample facilities to keep our rolling stock well painted.

The expansion of our paint shop facilities has enabled us to expand our carpenter shop also by adding to it the space formerly occupied by the old paint shop. The carpenter shop can now handle 15 cars at one time. This expansion of our shop facilities now gives the mechanical department ample space in which to keep the rolling stock in good shape, so essential to the rendering of high-class street railway service.

A "BOGEY" ON EXPENDITURES

For a number of years we have been operating on a budget system, which we designate as the "bogey." This system, which shows its value year after year, is the means whereby expenses are kept track of daily. Our bogey estimates are made covering the period of a calendar year in advance, and are set up in detail for each month. This bogey covers the estimated expenses per month for each account.

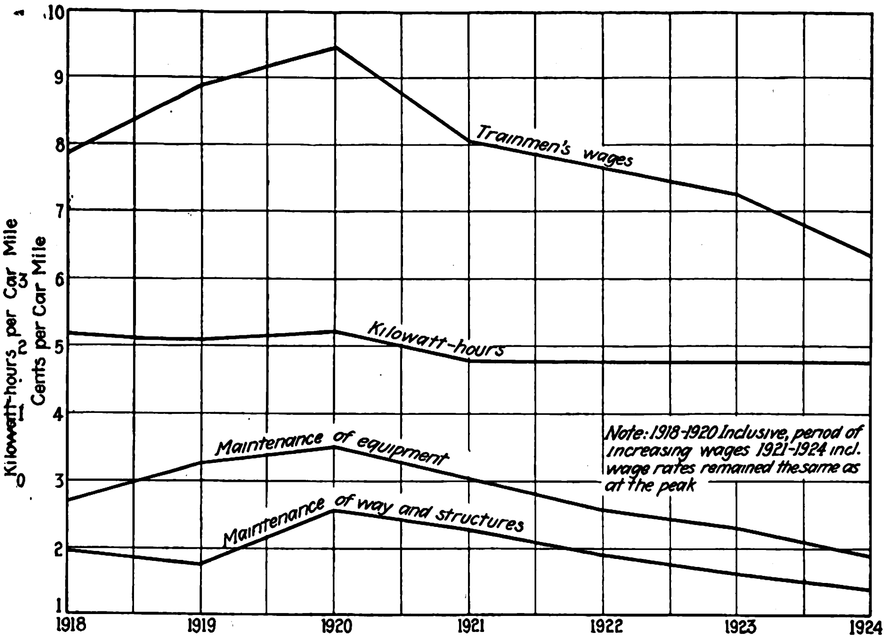
At the time that the revenue and expense bogey is worked up, the construction estimates are also worked up for a year in advance. After this has been approved, the cash requirements of the company by months are also worked up for the ensuing calendar year.

After the bogey has been approved by the manager, the amounts allotted to the various accounts are typewritten on special bogey sheets. A clerk has charge of keeping the bogey. He daily enters all charges, including labor, against the proper accounts. By this method, it is possible to get out a statement on any day showing just how the expenses stand in relation to the amount allotted for the different accounts. The bogey clerk gets out these statements about every six days. The head of each department receives a copy, on which it is stated whether the accounts he is interested in are running under or over estimate, and how much. The department head can then act accordingly.

The fact that one bogey clerk keeps track of the comparison between estimated and actual costs for all departments results in a co-ordination of expenditures which did not prevail under the former general practice of each department head keeping day to day memoranda of his departmental charges. In addition to this, economies are effected at an earlier date than would be secured if a department head was required to wait for accurate cost figures until he received the official financial report for the month.

FIRE PREVENTION

Especial attention has been paid on this property to the prevention of fires, because we recognize the fact that a fire may destroy a building or equipment that is essential to reliable and continuous service. All of our buildings are equipped with all appliances that the location and use makes possible, such as sprinklers, hydrants, pumps, fire hose and the correct type of extinguisher for the equipment housed in these buildings. We have also organized fire-fighting brigades which drill at frequent intervals in order that they may be prepared to extinguish fires.



Curves Show the Results Obtained from Various Modernization and Economy Measures

We realize that "good housekeeping" is essential to the prevention of fires and take especial care to maintain clean premises. In order that proper supervision may be given to this, we have organized a routine of monthly inspection by one of our office employees. This takes into account not only the housekeeping, but the inspector also notes wiring conditions and other items which may be the cause of fires. This inspector's report is made to the superintendent of the company and is carefully followed up to be sure that all defects are remedied.

We believe that this system has been of great benefit to us in preventing fires and is an example of our attention given to insurance matters, which, together with a strict observance of prevention practice, has resulted in a decrease of 20 per cent in our insurance premium at the present time, as compared with the rates in force in 1920.

The East Front Street shops and carhouse of this company cover a square block. The master mechanic and foremen in the ordinary course of their work must communicate with each other at frequent intervals. During January of this year a complete intercommunicating system of telephones was installed at this plant, so that one foreman can call any of the others without leaving his particular shop. The master mechanic can also call any particular foreman or department without leaving his office.

This system of telephones has more than justified the cost and expense of installation. A large amount of time is saved by the foremen in exchanging conversations about their routine duties, and they are able to give closer supervision to their respective departments, thereby increasing their own efficiency as well as that of their subordinates.

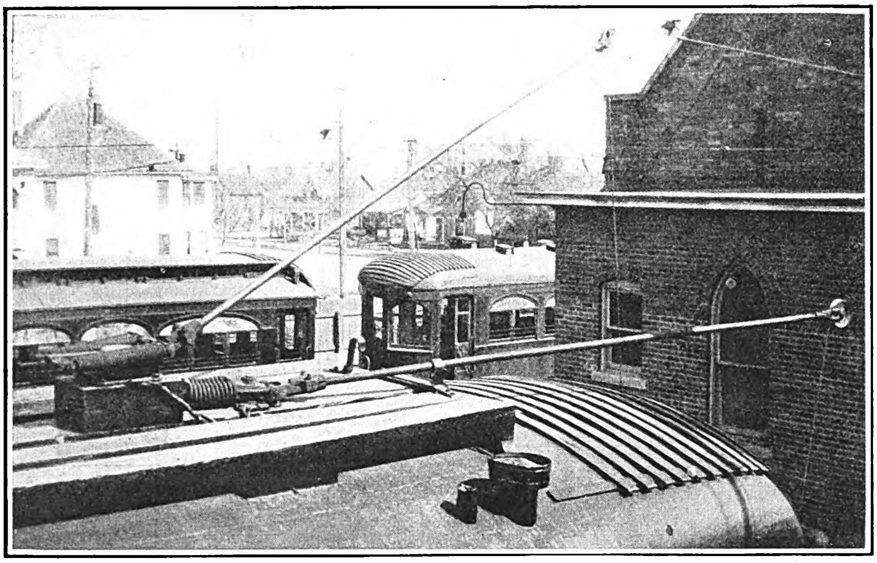
COURT ROOM MODEL OF STREET INTERSECTION

This company has had the same difficulties as other companies in defending suits for damages arising from accidents in which our cars are involved. The jurors in most cases seem to want to be fair to the company and the plaintiff. However, it happens in nearly every case that our lawyers and claim agent have a difficult time to explain by a word picture just how an accident happened, so that the jury will get the correct understanding of just what took place.

In order to eliminate this vexing situation, we built to scale a portable model of a street intersection. This can be taken into court and on it can be illustrated just how an accident took place. One of the streets in this model has double tracks on it and the dummy gage between the tracks is the same gage as the tracks, so that in the event an accident took place on a street on which there is a single track this dummy gage is used to illustrate the single track. The street cars and automobiles used on this model were bought in toy stores and are approximately in proportion.

Of course, this model only shows a tangent track layout, but it is sufficient for our purpose. If we have an accident on a curve, which requires illustrating, we make a drawing of the conditions for the jurors to look over.

This model street intersection is a very effective way to help the jury visualize the exact way in which the accident happened. By means of the model all the conditions at the time of the accident can be shown in a much more satisfactory way than by a long-drawn-out word picture. The jurors appreciate this as they realize it is for their benefit, and that the company is only trying to show them just how things happened so that they can arrive at a proper decision.



Each Interurban Is Supplied with Two Trolley Poles, One Equipped with a Wheel and One a Shoe, to Facilitate Backing and to Avoid Delay from Trolley Pole Trouble on the Road

This model is retained in the claim agent's office and is used by him regularly in discussing with claimants how an accident happened. In many cases our claim agent has been able to make a more satisfactory adjustment of damages through the use of this model, and in some instances has been able to convince the claimant that there was no liability on the part of the company.

CHARTS SHOWING CURRENT USED

On a property of this size the electric current consumed for various purposes, other than car operation, amounts to a considerable sum annually. We believe in using all the current necessary for convenience, but we try to discourage any waste of current.

In order to bring before the employees in the various buildings just what progress they are making in the reduction of current consumption, we post charts showing thereon the current consumed last year as compared with the current consumed over the same period this year. The line showing current consumed last year is in black and the line showing the current consumed this year is in red.

These charts are kept up to date by weekly meter readings. They are posted in conspicuous places in the various buildings. A small notice above each chart, the wording of which is changed frequently, exhorts the employees to do all they can to keep down the light and power bills. The graphic story conveyed by the charts is accomplishing results.

ELECTRIC ARC WELDING

During the present year, in order to meet the ever-increasing uses of the electric welder, we have installed at our East Front Street shops a low-voltage motor-generator welding unit with automatic welding head and control panels.

Up to this time we have used a resistance-type weld with great success where it could be applied, and for other work have used the oxyacetylene torch. With this new equipment we replaced the resistance welder and also handle with it much of the work previously done with the oxyacetylene welder.

The new welding unit is to be preferred over both previous methods. While it does not entirely replace the oxyacetylene welder it relieves the necessity of preheating in most cases, does away with the danger of explosions and is more economical. With the new unit the ordinary welding job can be done much faster; it practically does away with the danger of accident by shock; the equipment is much more easily regulated and requires no helper to operate it; it does not burn up the work and does a great deal better job than the resistance welder.

With the use of the automatic welding head, it is possible to reclaim worn flanges and treads on rolled and cast steel wheels successfully. This item alone means a very important saving in wheel replacement cost through an indefinite extension of the life of wheels. It is an economy which was not available to such an extent with the equipment previously used.

New Construction Standards Save Money

The advent of the light-weight car directed the attention of this company to a consideration of the construction standards in use. Particular attention was paid to track construction. We found that track could be built of lighter steel, and that changes could be made in ballast and foundation which would make these less expensive. In our 1923 presentment to your committee attention was called to some of these new standards as exemplified by sandwich type construction and concrete paving surface.*

During the present year we had to install several new sidings on some of our single-track lines, due to the fact that the headway between cars was to be reduced. It happened that the track on which it was desired to install these sidings was of the solid concrete type construction, with 70-lb. low T-rail, which was a standard type of construction at the time this track was built. We hit upon a plan of installing these sidings at a big reduction in cost over the ordinary method of installing sidings.

The tangent track rails, which were in place, were not disturbed, as we used these rails for the inside rails of the two tracks composing the siding. Of course, we had to excavate a space on either side of the siding. At each end of the siding a small amount of each rail of the tangent rails had to be cut out so that the switch fixtures could be placed. The entire tangent track at the siding, except as noted above, was not disturbed. This method of constructing sidings resulted in about a $1,500 saving per siding installation as compared to the practice of tearing up the tangent track and placing a siding in the ordinary method.

The overhead on our interurban lines is catenary construction and we use trolley poles with trolley shoes for current collection. Until a year ago our practice was to equip each motor car with one trolley base, pole and shoe. A spare trolley pole and a wheel were carried on each car tied to the trolley boards, so that in case the pole in use was jerked out of the base or bent while the car was on the road, the conductor would be able to insert the spare pole in the base and continue on the way. However, this required several minutes time.

The local cars on the Fort Worth-Dallas interurban have to back in or out of sidings to permit the limited trains to pass them. With only one trolley pole equipped with a shoe it was necessary for the conductor to hold the trolley rope in backing up, as it is dangerous to back up with trolley shoes without doing this.

About a year ago we decided to equip all our interurban motor cars with two complete current collecting trolleys, the trolley ordinarily used containing a trolley shoe and the other a trolley wheel. Now when a car loses a trolley on the road and bends or breaks a pole, all that is necessary is to put the other trolley on the wire and keep going. Also when a car has to take a siding, the conductor pulls down the trolley with the shoe on it and lets up the one carrying the wheel. This allows the car to back up without the necessity of the conductor holding the trolley rope. After the car is on the main line and ready to proceed the conductor pulls down the wheel contact and puts up the shoe.

---

*Described in ELECTRIC RAILWAY JOURNAL, page 1010, issue of Dec. 15, 1923.

This improvement in construction practice has resulted in a greater reliability of service because it very seldom happens now that a train is delayed on the road due to defective current collecting apparatus.

ACCIDENT PREVENTION WORK

We developed last year a system of analyzing the individual performance of trainmen with regard to accidents.

This work has been carried forward during the past year and the results justify its continuance, as the number of accidents and amount paid out during the year continue to show a decrease over previous years, in spite of the fact that the number of automobiles in Fort Worth increased more than 5,000 and the number of revenue car-miles operated by the street cars increased approximately 100,000 miles over last year.

The educational work done by this company during the past year has also contributed to the good showing made. A feature introduced this year along educational lines was to hold joint meetings between claim adjusters, transportation department inspectors, and other interested employees. At these meetings all angles of claim department work are discussed. This has resulted in close co-operation between the claim and other departments, since there is a better understanding of claim department requirements.

In Fort Worth on certain streets our tracks cross at right angles paved streets on which the automobile traffic is heavy. The automobiles travel at a high rate of speed, at times without thought of the danger lurking in approaching the street car tracks.

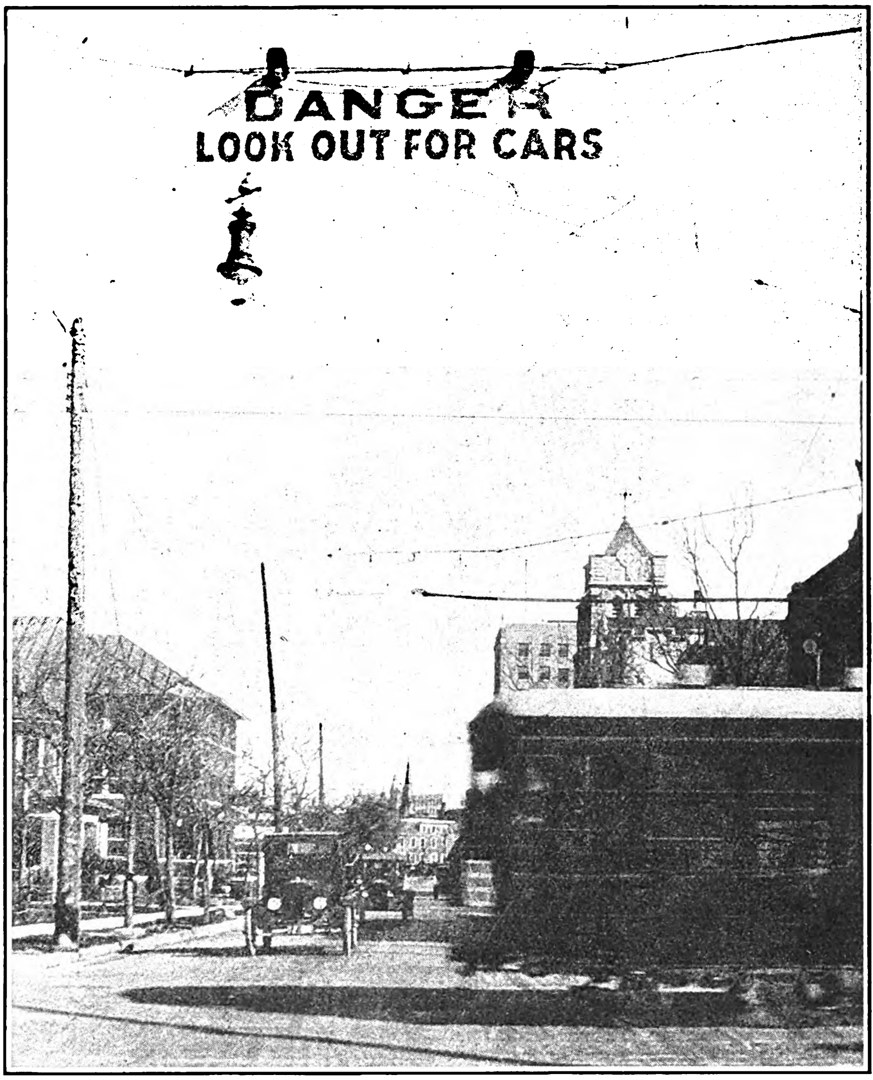
In spite of the fact that our operators approach these crossings with due caution, we had to devise some means of warning the automobilist that he is approaching a street car track in order to keep him from running head on into the side of the street car.

We have put up signs, stretched across the street, visible in both directions and illuminated at night. They read "LOOK OUT FOR CARS" and are painted with a white background and large black letters. These signs have been of great benefit in reducing accidents.

On our interurban lines we have erected signs on the span wires particularly where the interurban leaves the public highway for the private right-of-way. Several of these signs are in use; they also are illuminated at night.

Building Good Employee Relations

This company particularly prides itself on the good relations existing between management and employees. This state of affairs is due to the broadmindedness of the management in treating the employees as members of an organization all working together for the common good. What is good for the management is good for the employees, and what is good for the employees is good for the management. The result of this relationship is evident in many ways. There has never been a serious difference of opinion between the employees and the management of this property.



Warning Signs Placed at Crossings of Car Lines with Heavy Automobile Traffic Streets Have Helped to Reduce Collisions of Motor Cars with Trolleys

The employees have been made acquainted with full details concerning this company and it has been made plain that there are no secrets in the operation of the property. This has resulted in the employees having an understanding of the necessity for inauguration of new economic practices. It has gained for these economies the whole-hearted support that was so necessary to make them successful. The employees realize that the company expects everyone to do more than his duty and these economies have been obtained without the payment in any form of a bonus or a commission. Furthermore, the labor turnover among the employees of this company is very small, which means we have a group of contented, loyal employees.

On the other hand, the management always has the employees' welfare in mind by providing such things as mutual aid for the benefit of those who get sick; educational facilities; clean, sanitary work shops; clean wash and locker rooms; up-to-date tools and equipment with which to render the best possible service to the public; money is loaned when necessary, and last, but not least, a kindly word and the benefit of experience are given when asked for.

If the employees of an organization are in debt they are sure to be dissatisfied with their employment. Working conditions on street railways make it possible for the employee to keep out of debt unless he is improvident, or unless he, or members of his family, become ill.

Sickness in the family is a drain upon the employee, but if the wage earner is able to work it is not so serious as is the cessation of wages through illness of the family head. Recognizing this, we long ago organized an aid society which would pay the employee during his illness.

From time to time the scope and benefits of this association have been changed with the idea of giving the employee the maximum benefit possible. The first of this year we further increased the benefits until now they are as follows:

Payment of $2 per day sick benefit for 120 days and $1 per day for the next 60 days, a maximum of $300 for each illness.

Complete medical attendance, including services in case of major operations, and an eye, ear, nose and throat specialist.

A hospital allowance of $15 per week in

case the association physician believes hospitalization is necessary.

Drugs as prescribed by the aid physician.

A death benefit of $500 in case the employee is a member of less than six months standing and $1,000 after six months employment.

For all the above, the employee pays $1 per month and the company subscribes a like amount. Membership is compulsory with all white, permanent employees of the company.

We have for some time realized that preventive medicine would be desirable and that it would be much better to keep the man well, if possible, than it would be to cure him after illness. Beginning on Jan. 1, 1924, the Aid Society offered its members the privilege of complete annual physical examination, and the company has encouraged all the employees to take this test. Although there was no compulsion, more than 90 per cent of our employees have availed themselves of this offer.

The results of this test have been highly gratifying and the examinations have exposed many conditions which, if they had been allowed to develop, would have resulted in serious illness, chronic afflictions or, in some cases, death. The economic benefit to the employee is evident and the company has been the gainer by reason of the improvement in the employees' health, since we have found that poor health is conducive to accidents.

We have also recently arranged for group insurance of such of our employees as cared to increase their life insurance. Through the Southwestern Life Insurance Company more than 85 per cent of our employees are insured for 70 cents per month per $1,000 of insurance, with certain limitations as to the amount of insurance each employee could take.

VOCATIONAL EDUCATION

This company has developed a real desire on the part of a great many employees for educational work. This educational work has become a permanent thing in the company organization. Beginning on Sept. 1, 1923, we started the second year's work with our three electrical shop classes and they have been conducted very successfully during the past winter.

A number of the employees have started correspondence school courses this year, and a number have finished their courses. Still other employees have taken up educational work with various local educational institutions.

The number of employees taking educational work this year shows an increase over any previous year. At this time 112 employees are taking educational work, which is about 16 per cent of the total number employed. Employees are reimbursed for any money they may have paid out on account of completing their courses.

This company long ago saw the benefits to be gained by the people of Fort Worth if a full time director of vocational education were appointed to direct the work in Fort Worth. We have been interested in getting this accomplished for the past three years and finally on Jan. 1 of this year our efforts, together with that of others, were successfully concluded when the Fort Worth Board of Education appointed a full time director for the work.

DISCUSSION OF A.E.R.A. PROCEEDINGS

It is impossible for all department heads of this organization to attend the American Electric Railway Association's annual convention. However, we have not overlooked the fact that department heads who do not attend the convention would derive much benefit from a knowledge of the papers and discussions which took place at the convention. We believe that we have devised a way by which effectively to bring a digest of the proceedings before all department heads.

As soon as the published proceedings of the convention are received, a general committee of three is appointed from the department heads to review them. This general committee then appoints sub-committees and designates which part of the proceedings the various sub-committees shall handle. Each sub-committee in turn has a chairman. Each sub-committee chairman apportions out the particular subject that each sub-committeeman shall report on and the time.

In this way every subject in the convention proceedings is covered. The digest of the subjects as worked up in a paper by the designated department heads is read before all the department heads. After the paper is read, the meeting is open for discussion on that subject and many valuable points are brought out in this way.

This manner of bringing out the salient points covered by the annual convention was started this year and we believe we have made a forward step by thus acquainting the department heads with the best thought in the industry, and it also stimulates the department heads to think how the ideas can be turned to good advantage on this property.

MEN SUGGEST BUSINESS SOURCES

At intervals the manager of this company has made it his business to hold meetings with all the city and interurban trainmen and acquaint them with the trend of the company's affairs. These meetings have served to make the trainmen feel that they are a vital part of the Northern Texas Traction Company's organization, and as such are entitled to know the trend of affairs. The trainmen are given facts and figures which enable them to give the public intelligent answers to any questions asked them.

At one of these meetings with the city trainmen during the early part of May, 1924, G. H. Clifford, manager of this company, told the trainmen that he would like to have their individual ideas on how to increase the company's business. Each trainmen was requested to send him a letter setting forth his ideas on the subject. Mr. Clifford offered first, second and third prizes of $25, $15 and $10 respectively for the best letters written.

Ninety-five per cent of the trainmen sent in letters in response to this request. Many good suggestions were gained from them. The competition for the prizes was keen, and it was with difficulty that the committee, including the manager, finally decided on the winners.

A similar competition was recently held for the interurban trainmen, and all of them, without exception, turned in letters.

OTHER ACTIVITIES OF THE MANAGEMENT ON BEHALF OF THE EMPLOYEES

This past Christmas a Christmas Tree Party was given for the salaried employees and the members of their families. Presents were distributed to all, after which dancing was enjoyed. This party was most successful and we believe it will be an annual affair.

This company owns a camp at Lake Worth, which is about 10 miles from the business center of the city. This camp is used for the benefit of all employees, mostly during the summer months. The camp is open to the employees free of all charges, which also includes all the equipment contained therein. Hardly a week end passes during the summer that some group of employees does not make use of the camp. Part of the equipment is a motor boat which helps to make the use of the camp still more pleasant.

Every so often some of the employees will get up a swimming party and go to the natatorium in Dallas. On such occasions as this, the company furnishes free special interurban cars for the round trip. Generally before leaving Fort Worth enough food is taken aboard the car or cars, so that on the return trip from Dallas supper can be eaten aboard the train. Such parties as these are participated in by the officials and a good time is had by all.

NEW CAPITAL REQUIRED DURING THE YEAR

We sold $500,000 of five-year 7 per cent coupon notes to our employees and the public during March, 1923. With these funds we were able to carry on part of the construction work required during the present year. The economies herein before mentioned in this presentment have assisted us to finance the balance of our construction program out of earnings. For this reason, it has not been necessary for us to sell securities to the public during the past year. We believe, however, that our position has been strengthened and when new outside capital is required we will be able to obtain it on most favorable terms.

To sum up, we try to be among the first with regard to new devices which will result in economies both from original ideas and from ideas and practices gained from a study of other properties. However, we never lose sight of the fact that such economies as we adopt must improve our service to the public or lighten the burden on our employees.

We believe that service means more than giving a transportation service. The service we offer is fast. The headways are much less than they should be on most lines, but we believe that patrons should wait as short a time as possible for a street car. Furthermore, the frequent headway on our lines practically insures a seat for every passenger carried, and even during the peak hours it is not unusual to note the absence of standees.

We have modernized our property and our service. We have something good to sell—transportation—and we are selling it by modern methods, by advertising and by delivering the goods.

Claims Association Proceedings

The Medical and Surgical Session, a New Feature This Year, Brought Out Many Interesting Facts on Malingering, Re-examinations of Employees and Other Technical Matters—Topics at Other Meetings Included Automobile Hazards, Prevention of Highway Crossing Accidents and the Influence of the Claim Department in Promoting Good Public Relations

THE first session of the American Electric Railway Claims Association this year was held on Monday afternoon because of the setting aside of Wednesday as exhibitors' day. There was a good attendance when President W. H. Hyland called the meeting to order at 2:15 p.m. in Claims Hall on the Million Dollar Pier. An abstract of President Hyland's annual address follows:

President's Address

The history of railway transportation does not tell us at what time the claim agent or adjuster made his appearance in this country. Enough, however, is known of past ages, both from history and comparative conditions of society in our own time, to show that men have been employed from time to time, not to determine the rights of people, but to adjust their grievances and terminate their quarrels.

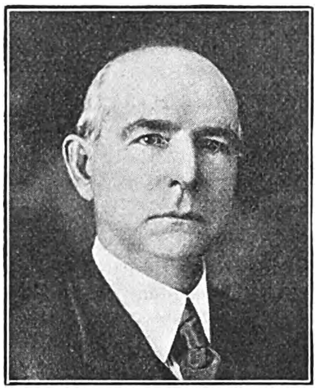
We, of course, are not particularly interested to know when the claim agent or adjuster first appeared in this country, but we are concerned indeed with the causes which made his coming inevitable and the variety of problems with which he has had to deal from his advent to the present time.

For many years the claim department of a railway consisted of only one man who performed the duties of the investigator, adjuster and claim agent. He was the unit of this economic enterprise. There were no interrelations with other claim departments, and the policies and undertakings of one were unknown to the other. Co-operation, which is the purpose of any organization, was absent in any real sense.

In 1904 the situation became so serious, however, that claims men called a meeting in St. Louis, Mo., to consider ways and means of protecting their enterprise and safeguarding the interests of electric railways. At this meeting the "Street Railway Claim Agents' Association of America" was organized.

This event, we believe, marked the first milestone on the highway of progressive claims work. Today the association adequately represents the various advances in all departments of thought and knowledge bearing upon claims work, and we believe that it is a trustworthy and competent interpreter of our needs and of our problems.

By reference to our program it will be noted that there is no joint meeting scheduled for the Claims and Transportation & Traffic Associations. One reason for its elimination this year was due to the belief of your president and executive committee that the medical and surgical committee, being a new committee, should have an entire day to carry out its program. It also appeared that if a joint meeting were scheduled, it would seriously interfere with the remainder of the program of both associations. With the elimination of the joint meeting we were able to revise our program and rearrange our schedule whereby all subjects approved by our executive committee were retained.



W. H. Hyland
Retiring President

At our last convention meeting you will recall that the incoming administration was instructed to take up with the parent association the question of employing a safety engineer or secretary to vitalize and make enduring the work of the Claims Association. Mr. Allison and Mr. Hellmuth were appointed a committee to draft a resolution setting forth the necessity for the employment of such a safety engineer and Mr. Hellmuth presented the resolution at the meeting of the American executive committee in January. The matter was referred to the committee on policy and finance. It was finally decided not to appoint such an official as the budget for the year did not provide for such an expenditure and the finances for the year would not justify it, and it was believed that the parent staff at association headquarters might be of greater service to the Claims Association.

H. D. Briggs
President-Elect

The recommendations of the committee were approved and I therefore presume likely there is some disappointment that the efforts of your committee in this matter did not prevail. But on the other hand, I believe we shall find both reasonableness in the decision and comfort in the thought that the parent association desires at all times to do that which is for the best interests of all the affiliated associations.

Realizing the advantages of an early start, your committees were appointed promptly. In addition to the committees provided for, there was appointed a committee on uniform state law governing the operation of motor vehicles approaching railway-highway grade crossings.

In planning the work of this committee it was the original intention to seek the aid of the United States Chamber of Commerce, the National Safety Council, the American Railway Association and by the appointment of committees in each state directly to take up with prominent state legislators and other agencies within each state concerned in the conservation of human life the imperative necessity of a law governing motor vehicles approaching grade crossings. Later the work of this committee was curtailed to the gathering of data bearing upon the subject and to the drafting of a proposed universal state law. Although the work of the committee is but a beginning, it will have accomplished much good in turning the minds of the people into a channel of thought bearing upon a condition which causes more suffering and a greater sacrifice of human life than any other agency in this country at the present time.

Your officers have received many invitations from associations engaged in accident prevention work to attend their meetings. These invitations were accepted and delegates were duly appointed to represent our association. In this connection I believe we also should establish the practice of extending invitations to officers of other associations engaged in similar work to attend our meetings; in fact, I believe that we should strive to secure for our association as members men engaged in claims work in England. It would be highly advantageous for both the claim agent abroad and the claim agent in America to know the policies and practices of each other, and it would be, I believe, a consummation devoutly to be wished by both.

In conclusion, I sincerely wish to thank all who have in any way helped to make this convention a success, and especially do I thank the chairman and members of committees who have labored so faithfully to furnish us such an interesting and instructive program. And I also wish to express my gratitude to our secretary, Mr. Welsh, and his assistants for the fine helpfulness and courteous service rendered me during my term of office.

The reports of the executive committee and of the executive secretary were then presented. The former was a record of the minutes of the meetings of the executive committee. An abstract of the report of the executive secretary follows:

Report of the Secretary

The following committees were authorized by the executive committee and appointed by the president at the beginning of the year: (1) Accident prevention, (2) claims department aspects of motor bus operation, (3) employment, (4) medical and surgical work, (5) resolutions, (6) subjects, and (7) uniform grade-crossing law.

The committees on employment, resolutions and subjects are standing committees, appointed each year for specific purposes. The accident prevention committee was appointed to continue studies of this subject begun in previous years. The remaining three committees are new, in so far as their assignments and activities are concerned.

The committee on claims department aspects of motor bus operation was appointed as a result of a resolution passed by the executive committee of the American Association, requesting each affiliated association to interest itself in problems common to motor bus operation.

The medical and surgical committee is the result of a generally accepted belief that the doctors should take an active part in the work of the association and have a definite part in the convention program. One entire session of this convention has been allotted to a medical and surgical program arranged by the chairman of the committee.

The committee on a uniform grade-crossing law was instructed to study the laws of the various states and prepare a suggested grade-crossing law which might be considered desirable for adoption uniformly throughout the country.

All of the committees have for presentation here reports of unusual interest to the members of this association. In addition a number of interesting papers have been prepared on subjects recommended by the subjects committee and approved by the executive committee. The net results of the year's activities will be laid before you in these sessions.

As a matter of record, there is given herewith a statement of the Hooper-Holmes Bureau reports, by member companies of the association for the year ended May 15, 1924:

Company	No. of Reports
Cleveland Railway Co.	1,625
Duluth Street Railway Co.	66
Georgia Railway & Power Co.	111
Hudson & Manhattan Railroad Co.	386
Illinois Traction System	7
Market Street Railway Co.	421
Memphis Street Railway Co.	60
New York State Railways (Rochester)	7
“ “ “ “ (Utica)	159
“ “ “ “ (Syracuse)	259
Pittsburghs Railway Co.	160
Tacoma Railway Co.	16
United Railways Co. of St. Louis	1,085
Union Traction Co. of Indiana	99
United Railways & Electric Co. of Baltimore	2,430
Total	6,891

During the year, your president made a special effort to communicate with every representative of your association and sent a special letter calling attention to the work of your medical and surgical committee. In addition, a personal letter was sent to each company's doctor urging him to attend the convention. Your president also designated a representative in each state to stimulate interest in the convention, and letters were sent by him to the various companies in his district. In all of these ways an effort has been made during the year to focus the attention of claims men throughout the country on the activities of the association and to provide for them the fullest opportunity for a discussion of their problems.

It may not be generally appreciated that the membership in your association is equal to that in the parent American Association. In other words, every member company is entitled to send representatives from its claims department to the convention and to designate one as its official representative with the power to vote. It frequently happens, however, that members of your association doubtless do not receive the communications of the association, since under our arrangement but one officer in each company is designated to handle association correspondence for all departments. One way in which the members of your association may have a closer contact with the headquarters office is by taking out individual membership. This will place you on a special mailing list and provide you with an annual subscription to the official magazine and includes one copy of the proceedings of your association.

In conclusion I wish to take this opportunity to say that the services of the headquarters staff are available to the officers, committees and members of your association and that we will be very glad to be of as much assistance as possible in making the work of this association more effective.

The report of the committee on uniform grade-crossing law was then presented. It was read by H. D. Briggs, assistant general claim agent Public Service Railway, Newark, and a member of the committee. An abstract follows:

Uniform Grade Crossing Law

The committee on uniform grade crossing law has followed the work of the national Conference on Prevention of Highway Crossing Accidents, held under the auspices of the National Association of Railway Commissioners. As a result of the study made the committee has prepared a draft for a uniform grade crossing law which is presented as an appendix.

The report was signed by H. D. Briggs, W. E. Robinson and W. G. Fitzpatrick, chairman.

On the motion of John J. Carlin, claim agent Richmond Light & Railroad Company, New York, the association voted to request the American Association to send a copy of the law proposed in the report to the attorney of every member company, so that he might review it and see how it corresponded with the law in his state.

The president announced the appointment of a nominating committee to report before the close of the convention and consisting of: Samuel B. Hare, Altoona, Pa.; W. F. Weh, Cleveland, Ohio; C. B. Hardin, St. Louis, and H. V. Drown, Newark, N. J.

The report on the claims department aspects of motor bus operation was presented by G. T. Hellmuth, claims attorney Chicago, North Shore & Milwaukee Railroad. Before presenting the report, Mr. Hellmuth referred to the recent meeting of the National Safety Council at Louisville which he had attended, and where, he said, important information in regard to methods of reducing accidents from automobiles had been brought out. He commended the work of the National Safety Council to the support of his auditors. He then read the report of the committee on motor bus operation. An abstract follows:

Claims Aspects of Motor Bus Operation

The committee was asked to study the requirements of electric railway companies in the examination of bus drivers over and above such requirements as there might be imposed by state laws and to present information on the aspects of bus accidents peculiar to bus operation and not ordinarily encountered in the operation of rail cars.

Bus and coach operation can be divided into at least three phases: In cities of large population, such as New York, Chicago, St. Louis or Detroit, bus transportation has been intensively carried on along lines similar in some of its characteristics to street railway carriage in these cities, i.e., there is a sufficient volume of traffic to permit of the gathering of much accurate statistical information and to call for the best type of operating management.

Interurban buses may be classified as next in importance as concerns revenue and extent of operation. In this class longer hauls are made on highways outside of city limits, and consequently much greater speed is at times attained.

The third class of buses engage in tours for all-day trips, or for longer periods of time. The company conducting this kind of bus service must particularly look to it that its rolling stock is sent out over the road in first class condition, as much mileage may be covered before the bus is returned to the shops; also the driver must be one who can be trusted to operate with the highest degree of care, even though he knows that he is miles away from headquarters and not under the observation of the operating department. On these long hauls, a higher rate of speed is usually attained than for buses in purely interurban use.

The committee is of the opinion that there is a marked lessening in accident frequency in bus operation in comparison with carriage by car.

Vehicle collisions are relatively very low, due, we think, to the high braking efficiency with the rubber to pavement contact, and also to the possibility of veering in direction, and in this way avoiding a threatening collision.

Passenger accidents fall into the very familiar classification known to all of us, viz., boarding and alighting, personal injuries due to sudden stops and starts, and injuries received by passengers on buses in collision with other buses or vehicles.

Both as to collisions with other vehicles and as to passenger accidents, the experience of two of the committee members' companies shows a very low accident rate. One of the companies in the year 1924 reports a motor bus accident cost of approximately $240 per bus, covering both urban and interurban operation, and the other company reports a total accident cost of $1,000 for the first six months of 1924, using forty buses, largely in interurban operation, but with some urban carriage. The following figures relate to the Chicago Motor Coach Company and the Fifth Avenue Coach Company:

CHICAGO MOTOR COACH COMPANY

Data on accidents for the six months' period beginning December 1, 1923, and ended May 31, 1924.

Collisions between coaches and other vehicles for which coaches were considered at fault — miles per accident	7,702
Collision between coaches and other vehicles for which coaches were considered at fault—passengers carried per accident	29,846
Personal injury cases due to sudden stops — miles operated per accident	65,089
Personal injury cases due to sudden stops — passengers carried per accident	252,224
Personal injury cases, boarding and alighting, for which coaches were considered at fault—miles operated per accident	39,839
Personal injury cases, boarding and alighting, for which coaches were considered at fault — passengers carried per accident	154,381
Cost of accidents per mile	.00695c
Per cent of gross receipts	1.77

FIFTH AVENUE COACH COMPANY

Data on accidents for the twelve-month period ended June 30, 1923.

Car collisions	52
Persons struck	52
Vehicles struck	1,563
Boarding	223
Alighting	167
Other accidents	1,209
Total	3,266
Injuries:	
Passengers	801
Employees	165
Others	104
Total	1,070
Serious accidents included in the above:	
Killed	5
Fractured skulls	1
Broken limbs	2
Other serious accidents	15
Total	23

The Fifth Avenue Coach Company, during the fiscal year ended June 30, 1923, to provide for payment of claims the company charged expenses and credited a reserve at the rate of 1¾ cents per bus-mile from July 1, 1922, to Dec. 31, 1922, and at the rate of 1¼ cents per bus-mile from Jan. 1 to June 30, 1923. It actually expended during the fiscal year $189,374 and there was left in the reserve for the year $10,327. The ratio of money expended for accidents and damages to the total operating revenues was 0.033.

The committee feels that by far the most important portion of its assignment lay in the study of the methods of bus operators whereby maximum safe operation is obtained. This prevention divides itself into three main channels: (1) Careful selection and training of bus operators; (2) proper choice and maintenance of equipment; and (3) public accident prevention.

Some interesting facts on the practice of the Fifth Avenue Coach Company in these particulars are given in a paper read in 1920 by G. A. Green before the S.A.E. (See abstract in the ELECTRIC RAILWAY JOURNAL for July 24, 1920, page 175.—EDS.)

Dr. A. J. Snow, consulting industrial psychologist for a number of industries, has made a study of drivers' selection tests, and states that after giving alertness tests to taxicab drivers for Chicago operators, he has found that those drivers who failed to qualify on tests for alertness are almost invariably the drivers whose accident records are bad. (See also ELECTRIC RAILWAY JOURNAL for Sept. 13, 1924, page 387.—EDS.) Professor Snow feels that mental alertness tests are of great value in choosing men qualified for driving, and he also says that the physical examination must not be ignored in selecting drivers and that "the physical examination should cover sight, hearing, heart and blood pressure, and no man who is seriously defective in any of these respects can be considered a safe driver." Professor Snow considers age as an important factor, and an analysis made by him showed that drivers between the ages of 30 and 39 had fewer accidents than those between 20 and 29. Other particulars are given in an article by Professor Snow in the July, 1924, copy of the *National Safety News*.

The report was signed by C. L. Young, D. M. Finch and G. T. Hellmuth, chairman.

H. C. Davy, assistant treasurer Metropolitan District Railway, London, said that on the London General Omnibus System there are some 3,000 buses which make 120,000,000 bus-miles a year, and the receipts were $45,000,000 per year. The accident costs were about 1 per cent of the gross, or less than that generally reported in America.

H. O. Allison, commercial manager Beaver Valley Traction Company, New Brighton, Pa., then presented the report of the committee on accident prevention. An abstract follows:

Accident Prevention

The committee said that accident prevention as an association study in recent years began with the Claims Association. Later a safety committee was appointed by the American Electric Railway Association and functioned for one year. Then the work of accident prevention was assigned jointly to the Claims Association and the T. & T. Association, and last year a joint report was submitted. This year individual reports will be submitted to these two associations.

The committee recommends that there should be only one accident prevention committee and that this should be a committee of the American Electric Railway Association so that the committee will represent the entire industry and get the benefit of the experience of all departments. Too close association of claims men with accident prevention work, in the opinion of the committee, might be detrimental to their efforts toward adjustment of claims after an accident occurred.

The report was submitted by E. L. Lindemuth, F. W. Mulford, Frank H. Warren, Allison J. Van Brunt and H. O. Allison, chairman.

This report aroused considerable discussion because it was taken by some delegates as the recommendation that claims men should withdraw from organized efforts to prevent accidents and leave this work to other departments of the company. H. O. Allison, chairman of the committee, disclaimed such an idea, but declared the committee believed an accident prevention committee, made up only of claims men, to be wrong. Other departments more directly responsible for accidents should also be members of the committee.

At the motion of Mr. Allison the recommendations contained in his report were then withdrawn, and in their place the association passed a motion made by him recommending to the American Association the appointment of an accident prevention committee, the personnel of which should be representative of the entire industry, and that the committee should function during the coming year.

The afternoon session concluded with an address by Col. H. E. Winsor, superintendent of investigations and adjustments Tacoma Railway & Power Company, Tacoma, Wash., on "What Can the Claim Agent Do Toward Encouraging Better Relationship of the Employees of the Company." This is published in abstract elsewhere in this issue.

Tuesday's Session, Claims Association

TUESDAY'S session was devoted to a symposium on medical and surgical topics. It was in charge of the chairman of the committee on medical and surgical work, Dr. Hart E. Fisher, chief surgeon Chicago Rapid Transit Company, Chicago. Dr. Fisher presented the report of the committee, as follows:

The medical and surgical committee was formed in November, 1923, and its purpose was the stimulation of interest in medical and surgical matters in their relation to the transportation industry. Many companies are far advanced in this phase of their organization; but there are many which are just now realizing the necessity of some medical supervision.

One of the first steps taken by the committee was to obtain the names of the medical representatives of the member companies and to urge their co-operation and presence at this convention. The committee wrote to approximately 350 member companies, and received in reply the names of 600 physicians. From this number, the committee again wrote to 221 of those who appeared to be most eligible to render assistance in medical and surgical work. The response was practically unanimous, and about 50 per cent offered active assistance, listing the questions in which they were most interested. A program of appropriate subjects has been arranged and it is to be hoped that now the work can be carried on with far-reaching results.

The report was signed by H. M. Bascom, M.D., E. W. Miller, M.D., and Hart E. Fisher, M.D., chairman.

Malingering

The first paper presented in the medical and surgical symposium was on "Malingering" by F. L. Mosser, surgeon Third Avenue Railway System, New York. The paper is published in abstract elsewhere in this issue.

President Hyland, in calling for discussion, said there was always danger that malingering will be suspected when it is not being practiced. He instanced an accident on the road with which he was connected in which a passenger fell backward and injured his spine, because the screws which held his seat fast came loose. The company fought the case but lost and had to pay a judgment of from $6,000 to $8,000. The injury was real and the man walks with two canes today.

Another delegate spoke of a case where a young girl who had suffered from infantile paralysis claimed an injury and collected $7,500, but the girl is now back at work and as well as before the alleged accident.

Dr. J. A. Watts, chief surgeon San Antonio Public Service Company, described two or three cases of genuine malingering and also the case of an employee with a stiff back which seemed to be of that kind, but an X-ray showed a deformity which caused trouble under the work of bending and lifting in which the man was engaged. This work was changed, and there has been no further complaint.

A delegate asked Doctor Mosser whether an unfriendly doctor could use a temporary local anesthetic to produce anesthesia during the visit of a company doctor on a patient. The doctor replied that this might be accomplished by a blow or by certain drugs, but except for a blow, it would be difficult to fool the physician.

Dr. J. J. Wymer, surgeon New Orleans Public Service, Inc., told of the case of a man who claimed he had been injured in a collision and deceived a number of leading psychiatrists in New Orleans. Finally, the company paid him $6,500 and inside of two weeks he was entirely well.

Dr. H. L. MacLean, chief surgeon Virginia Railway & Power Company, said that it ought not to be difficult to detect malingerers. They have to be coached by a doctor, and no educated and decent doctor would participate in such a fraud. It would have to be a poor doctor to do the coaching, and it ought not to be difficult to catch him. The practice with his company is to go directly to the doctor in charge of any person injured and get his facts.

Doctor Mosser warned that unfortunately some very prominent physicians sometimes are capable of coaching in cases of this kind.

President Budd Addresses Convention

At this point President B. I. Budd, American Electric Railway Association, entered the hall, and said in part:

"It is a great pleasure to have this opportunity to say a few words to you. The work of the Claims Association is one of the most important of our entire association, not solely because that department of our various member companies involves the expenditure of great sums of money, but more particularly because what they do have a direct bearing on public relations, and public relations are, perhaps, the very most important considerations of every factor that enters into the operation of the utility company. I do not know where there is a better opportunity to convey the best side of the company to the public than where the contact is made with some one who is injured and who not only feels a grievance on account of possible suffering and loss of time, but also a sense of money lost and a sense of a desire to bring retribution on the company which brought about the injury.

"So it requires a great amount of skill in diplomatic work to meet this situation. The claims department has difficulties that would appear to the uninitiated, as they often appear to me, to be almost insurmountable, where the representatives of the department go into an atmosphere absolutely unfriendly. Yet, after the claims representative has entered, it is more than likely that the person is made a friend, one who can be relied upon to control the opinions of a great many people in his or her neighborhood in favor of the company. I have had some very striking examples of this. I had a man who used to write letters to me over a period of a year of the most unfriendly and rabid character. It almost seemed a personal animosity, although he did not know me except as the head of the railroad. None of these letters was such as could be answered, and in accordance with our practice, we never answer letters where there is anything in the nature of a complaint. We always make a personal call, and letter writing is strictly taboo in our organization in connection with complaints.

"Finally, after a particularly strong letter, I met a friend who lived in the neighborhood of this complainant and asked what kind of a man he was. My friend said that he was highly educated and had a nice family and was a very good sort of fellow. I thought it was strange that a man like that could write letters of such an intemperate character, so I asked my friend to invite me and him to luncheon. At this lunch the complainant told me the history of his animosity toward the company. It seems that eight or ten years before, a member of his family was injured, and the claims representative of the road (before I had anything to do with it) not only did not act fairly but made a bad impression upon him. I readily agreed to make an adjustment in the matter. Since that time the man has been one of our best friends. Often he calls me up to tell about inequality of service, that is causing irritation or something that can be corrected to advantage. This indicates that the claims department, though small in size, can be a tremendous force in improving public relations.

The following papers were then read: "Organization of a Medical Department," by J. J. Wymer, surgeon New Orleans Public Service, Inc.; "Medical Survey of Employees" by Alden Coffey, chief surgeon Northern Texas Traction Company, and "Periodical Re-examination" by E. W. Miller, chief surgeon Milwaukee Electric Railway & Light Company. These papers will be found in abstract elsewhere in this issue.

Re-examinations and Personal Injury Cases

At the conclusion of the presentation of the papers on re-examination of employees, one of the delegates asked if Dr. Miller had found any disposition on the part of the employees to object to the medical treatment of the members of their families and also whether such treatment was rendered at the home or at the central medical headquarters.

Dr. Miller explained that the acceptance of treatment for sickness by the men for their families was entirely voluntary, but the department endeavored to give as good service as they would receive from any physician or surgical source, and it was found that this service to the families was appreciated. No attempt was made by the department to supply the services of specialists, just complete medical service, and this was given in the home and in the office. During 1923, some 60,000 house calls had been made without charge. The other physicians in the city had not indicated any opposition to this plan, although the department treated persons able to pay the fees of private practitioners.

Dr. Fischer, Chicago Rapid Transit Company, said that when that company began its periodical re-examination a number of years ago there was some opposition to it on the part of the men, but now they realize its importance and that where any defects are discovered, the company gives men less responsible and hazardous positions where possible. Thus, a man disqualified as motorman can often be used in train service as a conductor or guard. It has been found that as these examinations are continued, the defects discovered have become less with each examination. It will be found also that the death list will decrease. Such a medical survey is conducted every two years and covers all of the employees of the Chicago Rapid Transit Company. To make such an examination acceptable, the company should explain to the men that they are getting without charge something which most men are glad to pay for, and they should really be more interested than any one else in learning whether they have any defects. The discovery of such defects in time will often prolong their lives.

Dr. Miller, in discussing the treatment of personal injury cases, said that the Milwaukee policy, begun long before he went to Milwaukee, was for the company to look out for the medical treatment of all persons seriously injured by the railway, when that was practicable, whether the company knew that it was legally responsible or not. The automobile had greatly increased the number of serious injuries on the street, and the Milwaukee company has in the hospitals now a number of automobile cases, mostly surgical. These patients are receiving whatever treatment is necessary. He was satisfied that this policy was desirable.

Dr. Driscoll, Richmond Light & Railroad Company, New York, suggested that that policy might make a jury think the company was liable in cases where it was not. He recalled the case of a slight collision between two cars where no one was injured, but one woman fainted. He happened to be present and administered some aromatic spirits of ammonia to the woman who fainted. Later she brought suit and his act in administering this simple restorative was greatly emphasized and was largely the cause of a verdict of $1,600 awarded against the company. The company, however, had appealed the case.

Dr. Miller explained that he did not mean that the company supplied treatment to cases where there was no liability, but simply to the doubtful cases. However, if treatment is begun in any case, it is continued except where litigation is brought.

Dr. H. L. MacLean, Richmond, Va., said his company followed the same policy of treating every one injured by the cars, whether the company was responsible legally for the injury or not. He had been asked in court if he was still the physician of a claimant and he always had great pleasure in explaining to the court and prosecuting attorney that it was the principle of the company to extend treatment to any one injured, whether the company was liable or not.

G. R. Whitmore, general claims attorney Illinois Power, Light & Traction Company, Peoria, Ill., said that company at first followed the plan described in Milwaukee and Richmond, but during the last five years applied only first aid service, i.e., for the first 48 hours. In the case of employees treatment is provided during the whole period of disability.

President Hyland explained that on the road with which he is connected, the company doctor visits the injured patient always. Such a visit is required by the New York State law and by the regulations of the Interstate Commerce Commission.

The papers on "Hospital Associations" by Dr. H. M. Bascom and on "Co-operative Hospitalization for Corporations" by Dr. F. S. Macy were then presented. They will be found elsewhere in this issue.

At the conclusion of the session, on motion, a vote of thanks was extended to the attending physicians and surgeons for the information given on various topics, and the association voted to continue its medical section.

Thursday's Session, Claims Association

THE first paper presented at the session on Thursday afternoon was that on "Pelvic Fractures" by Dr. J. A. Watts, San Antonio, Tex. At the conclusion of the presentation of the paper, a vote of thanks was unanimously passed to Doctor Watts for his valuable paper and the hope was expressed that he would attend the meeting of the association in 1925.

In the discussion Doctor Miller, Milwaukee, explained a diagnostic sign for fractured pelvis which was first developed by Doctor Lehman of Milwaukee and was not found, so far as he knew, in any of the books. If the patient is placed on his back with both legs extended and has a fractured pelvis, he cannot raise the heel of his foot on the side of the fracture with his leg in extension.

In answer to requests, Doctor Watts then explained the position of the foot with an upward and backward dislocation of the femur. On request he also gave some facts on the subject of sacro-iliac strain.

C. B. Hardin, general claim agent United Railways of St. Louis, presented a paper on "Automobile Hazard." Mr. Hellmuth then read a prepared discussion contributed by H. K. Bennett. Both of these papers will be found in abstract elsewhere in this issue.

Automobile Hazards

S. W. Baldwin, attorney the Connecticut Company, said that the question of examinations for drivers of automobiles had been considered with great thoroughness at the recent convention in Louisville of the National Safety Council. In the Eastern Atlantic States, from Maine to Maryland, and including Pennsylvania, there is an automobile commissioners' conference, and in all of these states some sort of license to drive a car is required before a person may go on a highway, except under instruction. The speaker hoped that a similar practice would be followed elsewhere.

A discussion developed along the direction of the possibility of accidents to automobiles between blocks and Mr. Hellmuth pointed out that in not all cases is the automobile driver responsible for such accidents. If an automobile proceeding on the track is stopped by something ahead and is run into by the car behind, the railway is responsible. This is also the case where a car attempts to turn in a block and the engine stalls when the automobile is on the track, unless the motorman keeps a proper lookout.

J. H. Handlon, San Francisco, said that 70 per cent of the accidents on the Market Street Railway were in connection with automobiles. A serious danger now is the financial irresponsibility of many automobile drivers, and another is their carelessness even when insured. Eventually, he believes, the insurance companies will have to classify their risks in various ways, as whether the car is operated in a congested district, whether the person owning the car is the exclusive operator, his past experience and past record, the nature of the driver's employment, and whether he drives only occasionally. Premiums for such casualty insurance would vary accordingly. Eventually, he believes also, there will be state insurance and compulsory insurance.

Mr. Carlin, Richmond Railway & Light Company, argued in favor of collecting damages from automobile drivers who injured trolley cars. He thought that, especially in smaller communities, the effect was to make drivers more caretful.

In reply to a question, President Hyland said that under the law of New York State the trolley car has the paramount right between streets because it is a public carrier. This does not mean that this right destroys the last clear chance doctrine. If something is in the way of the trolley car, it doesn't have paramount right until that obstruction is out of the way.

Mr. Handlon, San Francisco, said that of all the automobile accidents of his company, only 19 per cent result in claims. While his company files claims against automobile owners who injure trolley cars, its practice is to confine these claims to cases where the damage is considerable or where the automobile comes in contact with motionless company property, like standing street cars.

Mr. Baldwin, New Haven, did not see that it would create ill feeling if the company insisted only on just claims for damages.

Mr. Hardin, St. Louis, mentioned an arrangement which the St. Louis company made with the owner of a large number of motor trucks, by which the damage to both sides is divided equally. Previous to this time from five to twenty collisions occurred during a month with the trucks of that concern. After that, they practically disappeared because the truck owner realized that if there was an accident, he would have to pay half, whether his driver was at fault or not. The plan worked so well that it has been followed by the company with a number of other large users of motor trucks.

H. V. Drown, Public Service Railway, Newark, says his company believes firmly in collecting damages from automobile drivers where they are at fault. The money collected is substantial; the lesson in carefulness is worth while; and if the driver is insured, the insurance company learns to pay promptly.

Prevention of Highway Crossing Accidents

H. A. Rowe, chairman of the committee on prevention of highway crossing accidents, American Railway Association, and claims attorney of the Delaware, Lackawanna & Western Railroad, was introduced by President Hyland as having saved a great many lives by his efforts. His paper is printed elsewhere in this issue.

Mr. Rowe added a few comments to his paper. He said, among other things, that on the steam roads there is always the danger that a collision with an automobile will derail a long train. The slogan "Cross Crossings Cautiously" had been pushed through posters, pamphlets and talks, and had undoubtedly been effective. It was impossible to eliminate all grade crossings. In the last ten years the company with which he was connected had eliminated 150 at a cost of $96,900 for each crossing eliminated. The effect of the slogan has been not only to induce caution but to encourage the newspapers to place the blame for crossing accidents where it belongs rather than always to place it on the railway. Mr. Rowe said he found that those involved in railroad crossing accidents represented all classes in the community including the learned and captains of industry, showing that all classes were careless at railroad crossings.

In reply to a question as to means for protection, Mr. Rowe said that he favored electric and pneumatic devices operated in conjunction with the approach of the train. Crossing gates are being abandoned because many automobilists seem to delight in smashing them. After the gate, there is manual protection with a man waving a "Stop" sign. This seems better than a flag system because the employees sometimes use the wrong flag and all highway travelers do not know the meaning of the flag. If the flagman waved a white flag, the automobile driver might think that it was an invitation to approach, whereas if the flagman used a red flag, the train would stop. Hence, the stop sign is preferable.

In reply to another question, Mr. Rowe explained that railroad crossing gates were painted in black and white stripes because it was believed these were the most conspicuous colors to use on the average highway. Prior to the adoption of this combination, there was a great variety of colors, and painting was often neglected. With something definite as to color, it is easier for them to be maintained in good order. He hoped that the time is fast approaching when there will be a national uniform system of crossing designations, rules of the road, inspection of cars, inspection of drivers, etc.

A resolution was then passed expressing the thanks of the association to Mr. Rowe for his paper and presence at the meeting.

Nominations

The nominating committee then made the following report:

President, H. D. Briggs, assistant general claim agent Public Service Railway, Newark, N. J.

First vice-president, J. H. Handlon, claim agent Market Street Railway, San Francisco, Cal.

Second vice-president, C. B. Proctor, claim agent Memphis Street Railway.

Third vice-president, J. S. Kubu, assistant superintendent accident department, Cleveland Railway.

For members of the executive committee: S. J. Herrell, claim agent Knoxville Power & Light Company; L. F. Wynne, general claim agent Georgia Railway & Power Company; G. T. Hellmuth, claims attorney Chicago, North Shore & Milwaukee Railroad; Dr. Hart E. Fisher. chief surgeon Chicago Rapid Transit Company.

For convention secretary: E. L. Lindemuth, claim agent Wilkes-Barre Railway.

As there were no other nominations, this ticket was elected.

The new president and vice-presidents were then escorted to the chair, and expressed their appreciation of the honors conferred on them.

A past-president's badge was then presented by Russell Sears of Boston to the retiring president, W. H. Hyland. To this President Hyland fittingly responded, and at 5:30 p.m. President-elect Briggs, who had taken the chair, declared the sessions of the convention to be over.

How the Claim Agent Can Help Better Relations[*]

By H. G. Winsor

Superintendent of Investigations and Adjustments
Tacoma Railway & Power Company
Tacoma, Wash.

H. G. Winsor

Various Ways Are Suggested, Based on Practical Experience, Where the Claim Agent Is Particularly Well Fitted to Help

THE success of our member companies is and always will be dependent to a considerable degree on a good understanding of our problems by our employees and by the public. As to methods, local conditions must govern to a considerable extent. In our own organization we have had splendid success through employee representation in working out our problems.

In June, 1922, we set up an organization which is termed the Electric Company Co-operative Committee and is composed in part by company officials appointed by the manager, and in part by employees elected by secret ballot. We have found this an excellent medium through which we can understand each other better, and secure for both the company and our employees a considerable improvement as regards the conditions affecting operation. We also have a "foremen's conference," and at present are planning a men's conference, both of which will eventually be co-ordinated with the work of the co-operative committee.

The beneficial results of taking the employee into your confidence and discussing with him, frankly, all of the problems you have to face will surprise the most ardent advocate of democracy or the highly developed psychologist.

For several years there has been a rapidly increasing number of publicity advocates in the public utility field. The official who still believes that he must keep secret the most interesting and important facts in connection with the operation of an institution which serves the public is likely to be referred to as a relic of bygone days, and rightly so.

The importance of success in publicity cannot be overestimated, but to be assured of success its direction must be placed in the hands of a man who by education and experience is fully competent to win and retain the confidence of both the management and the public.

What the claims official can do to encourage or assist in the consummation of such an improved condition must of course depend to a considerable extent on the opportunity presented in each individual case. However, we should never overlook the fact that initiative often develops opportunity and furnishes a medium for successful accomplishment.

In our association and contact with the employee we stand, or at least should stand, in the light of an impartial arbiter as well as a friend. While we have no voice or vote in the administration of justice, as between the employer and employee, our estimate of fairness and our influence for a "square deal" is, I believe, generally recognized. We have the responsibility of showing to our employees that it is not only our duty but our pleasure to see that everyone with whom we do business is assured of prompt attention and fair treatment. This applies with equal force to the employee and the public.

In our dealings with the public there are many ways in which we can promote better relations.

The investigator who interviews a witness will leave either an impression of his fairness or the reverse. The form letter mailed from the office carries with it a suggestion of impartiality. The investigation of a complaint and a satisfied customer may count heavily on the right side of public opinion.

Courtesy must not be confined to the platform men. Every official, and especially the claims men, who by the nature of their duties are subject to unusual conditions in business conduct, should studiously maintain a courteous demeanor.

Claims officials should affiliate with civic organizations and take an active part in the work which such bodies are doing. They should be well trained and suitably equipped to develop discussions tending to educate the public in the problems incident to the particular kind of service which is furnished. It is also possible to secure through an affiliation, valuable assistance from the membership whenever it becomes necessary.

---

[*] Abstract of a paper before the annual convention of the American Electric Railway Claims Association, Atlantic City, N. J., Oct. 6-10, 1924.

Safety organization and work in the public schools furnishes a medium for improved relations with the community. In our city this work has been going on for eleven years. During that time more than 27,000 pupils have received the safety scout button, which must be earned by passing an examination. Many of the pupils who were in the classes several years ago are now driving automobiles; others are engaged in business or industrial occupation, and the lasting impression made when they were of school age has a most favorable result, where relation with our business is concerned.

Medical and Surgical Session

A Special Feature of the Claims Meeting on Tuesday Afternoon—Prominent Physicians and Surgeons Present Papers on Technical Topics

THE meeting of the Claims Association on Tuesday afternoon was conducted under the direction of the medical and surgical committee, Dr. Hart E. Fischer chairman. Altogether seven papers by leading medical and surgical officers of prominent electric railway companies were presented. The discussion brought out so many interesting points that this meeting will probably be a permanent feature of future Claims conventions. Abstracts follow of the papers presented at the Tuesday afternoon meeting.

Malingering

By Frederick L. Mosser, M.D.

Surgeon Third Avenue Railway System, New York

THOSE of us who are called upon to make decisions concerning malingerers are subject to much criticism, especially by the laity, as to whether we have exercised a sufficient degree of fairness to which each individual is entitled before we make our final decision. Those who under the law are responsible for the results of accidents, in the causation of which they have had no part, should not be subjected to greater burdens than those for which they are legally responsible. With these points as a basis, let me mention the several essentials which are necessary in order to cope better with the subject.

WHAT IS A MALINGERER?

Perhaps no better picture can be drawn to illustrate this than that of the surgical spine, the symptoms and complaints of which, as you know, suddenly disappear after the injured receives his compensation settlement. And right here let me add that there is absolutely no doubt that the number of malingerers has increased, both at home and abroad, since compensation laws have been operative.

There are two kinds of malingering; one which manifests itself frequently in such cases as fractures or strains, or any injury requiring several weeks for convalescence; and the other, the absolute faker, where there is an absolute deception on the part of the subject of both objective and subjective symptoms. In the former class are those injured and confined in railway accident hospital wards, where there has been created a certain amount of friendship among themselves, and everything is very comfortable. They have plenty of time to play games, to smoke, etc. Under these circumstances, they feign all manner of symptoms, first, to prolong their stay and keep away from work, and second, with the idea that they may develop a permanent disability, eventually collecting more compensation.

Some of the artificially created conditions which pass in review are the individuals who deliberately injure themselves. Purposely placing the hand or foot under the wheels of cars is often resorted to. In this, it will generally be found that the wounds are right sided, especially if the individual is right handed. A further point is that self-inflicted wounds have no bruising connected with them. Crutches, spectacles, strappings, trusses, bandages, freshly applied iodine, are frequently used to create the appearance of disability. Frequent complaints of malingering are pain and hyperesthesia. In this we find that the history is unsustained, and ordinary traits of suffering absent.

It is impossible to formulate any symptoms of this malady. A distinction should be drawn between deliberate simulation or exaggeration of symptoms, and that which is unconscious. In the latter variety are those who are morbidly solicitous about their health, chronic invalids, etc., and I have found that persons of intelligence and education have more difficulty in deceiving, as they are bound to express themselves freely. Reticence in these matters should arouse suspicion.

A good way to handle malingerers is to let the patient think he is fooling you. Give him your sympathy, and assist him in exaggerating his symptoms more and more. In other words, give him plenty of rope and he will soon hang himself. The surest means of detecting malingering is to have a thorough understanding of the types of people who actually do it, the way they behave, together with a careful consideration of the circumstances surrounding the case. The vast majority of malingerers are those who exaggerate some actual defect, and it is the problem of the examiner to decide whether the defect complained of is of sufficient cause for the individual to take the attitude he does.

THE TREATMENT OF MALINGERING

In my opinion the treatment of malingering is to prevent it. This in itself is a problem which to a great degree is yet unsolved; but it seems to me that the product of our combined efforts is the essential element to be employed as the panacea against deception.

The Organization of the Medical Department

By J. J. Wymer, M.D.

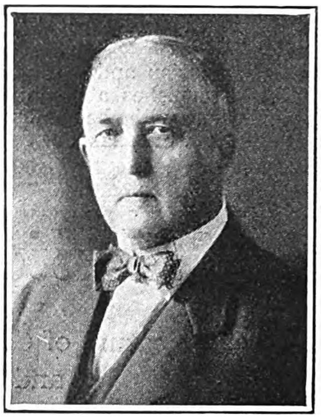
Surgeon New Orleans Public Service Company

WHEN an attempt is made to operate a medical department as a part of a large corporation many things should be borne in mind. For instance, the location of the department should be as nearly central as possible, or at least in close proximity to, if not in the same building as, the general offices. Effort should be made to get away from excessive outside noises and to have large, ventilated and well-lighted rooms for all parties connected with the department. The equipment should be as modern as possible and all details should be carefully studied out.

Having completed the office and equipment, an introduction of the entire staff with all chiefs of departments should be the next step, so that an acquaintanceship will exist between every working member of the staff and every department head. At this meeting a brief talk by the chief surgeon, explaining in detail the method of examination of new employees and why he rejects for certain physical conditions, will enlighten them and will probably

J. J. Wymer, M.D.

Ernest W. Miller, M.D.



H. M. Bascom, M.D.

later result in a very close co-ordination. In the organization of the medical department it should be generally understood that every new employee, regardless of position, shall be referred to the medical examiner for examination. Subsequent examinations should be required of every employee in the service at least once every two years, and if any defect is found which would make an employee a hazard, a careful notation should at once be made of it on the record and the head of the department to which he is attached notified. At the same time an opinion should be given as to the employee's capability of carrying on in his former occupation.

The medical department should be open all day, and after closing hours some member on the staff should keep in touch with the switchboard to take care of any emergency. At the same time the switchboard operator should know at the end of each day who will be on duty after the closing of the office and where he can be found.

When treating an injured employee the company's physician should try to remember that the man probably comes because he has been directed by his superior to call upon the company's physician for medical or surgical assistance, and that otherwise he would probably seek relief from his family physician or some institution. This means that every effort should be made to render him as free from pain as possible, and certainly to have him leave the office with a feeling that he has not only found a good doctor but at the same time a friend. In all subsequent visits he should receive the same degree of courtesy, whether treated by the head of the department or his assistants.

When it is necessary to send back to work a man who is not entirely well but is physically qualified to perform some labor, he should he told that this is being done for his own good and that a certain amount of work, forcing him to use the injured limb, will be a means of his getting 100 per cent recovery, which he probably would not get if he remained at home. When the department is returning a man not physically fit to do full labor, a note should be written to his foreman or the head of the department, setting forth what the man is capable of doing. This will help to eliminate any friction which may occur between the foreman and the employee.

If the medical department is located in a large city, it should not attempt to do the work of an old-time practitioner. If a man with a foreign body in his eye or any other accidental eye injury comes for treatment it is better to turn him over to an eye specialist, one who is known to be capable of handling such injuries. The same applies to the ear and nose. This may be the means also of saving the company doctor considerable embarrassment, should a damage suit result, following termination of the case. It is a good policy to X-ray all joint injuries, show the man the plate and discuss it with him freely. In fracture with displacement, it is well to get the skiagraph before the reduction, if possible.

The medical department should make periodic sanitary surveys of the properties, reporting the physical sanitary defects to the general manager, at the same time sending a copy of the list of such defects to the head of the department. This report should cover building, lighting, toilets, urinals, drinking founts, disposal of rubbish and drainage.

At intervals throughout the year, lectures should be given to the foreman on first aid and resuscitation, and a heart-to-heart talk on the conservation of health of the employee by promptly reporting all types of injuries, regardless of how minor they may seem at the time of the accident. Stress should be laid on the facts that in giving first aid the promiscuous use of iodine, thrown pell-mell over the injured member, is not good and is likely to cause iodine burns, which are more difficult to handle than the original injury; that loading an abraded surface with raw cotton as a first aid measure is also bad because it is so difficult to remove when the patient reaches the surgeon's office, and that there are other points which the layman considers good treatment but are decidedly bad from a surgical standpoint.

To handle all personal injury cases, which comprise injuries sustained by the riding public or track accidents to pedestrians, the medical department should ascertain the full extent of injury and advise the claim department so that a settlement may be made and release obtained in cases where the company is liable before the claim finds its way to a shyster lawyer. The department should also assist the company attorney in formulating questions to ask the expert witness for the plaintiff.

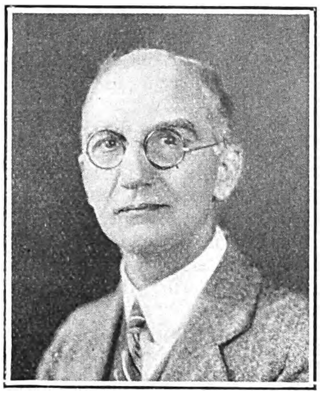
The medical department should further examine any employee who is sent to the office by the head of another department to determine if the employee is capable of performing the work assigned to him. This need is occasionally brought about by employees complaining that the work assigned to them is too heavy and that they are physically unfitted to do it. When an employee finds or knows his inability to do the work assigned to him will probably result in a call at the office of the medical department, and if he is unable to fool the doctors, he will think twice, and the result will be better co-operation between the men and the heads of the departments.

The writer is of the opinion that all personal injuries should be taken care of by some member of the staff. But no attempt should be made to treat the injured individual other than giving him first aid, if the company physician happens to be the first one to see him. The injured individual should then be advised to employ his family physician, and it might be well in some instances to learn who the family physician is, so as to be able to communicate directly with him. This method of procedure unquestionably will make the general practitioner feel more kindly disposed toward the company, and in the event that he sees the case first it will be less difficult to obtain information from him concerning the injury and also his permission to examine the patient.

Another reason for not continuing in the treatment of the injured individual is the likeliness of the courts or juries to attach liability to the company at times when no liability exists.

The writer does not believe that the system used by some companies of having a number of doctors of a district appointed and to have one see the case for the company is as good as a medical staff. The argument against district doctors is that the company incurs the enmity of many physicians living in the same district, and they make it exceedingly difficult for the company to get any information on the case. It is not advisable to pay for any information which the doctor is

J. A. Watts, M.D.



F. S. Macy, M.D.

Alden Coffey, M.D.

willing to furnish, because bought information is not worth much when held before court or jury.

When medical information is obtained for the claim department from another physician it is well to quote that physician's statement verbatim, then, if it does not agree with that of the company's physician, it would be well for him to render his opinion on a separate piece of paper, marked confidential.

It is not desirable to have regular specialists on a company medical staff. A better plan is to have a working agreement with as many as possible in the city in which the company operates, to see cases sent to them and render opinions. The testimony of such a specialist in open court has considerably more weight than if he was attached to the company's medical department. The services of the specialists should be only for the examination and opinion and should not include treatment.

X-ray examinations may be made in the office of the medical department, if it is provided with proper equipment, and in cases of personal injury, the negative should be carefully marked at the time the plate was taken, so that there will not be the slightest question as to identification of the plate if it has to be presented in court. Should the personal injury case terminate in damage suit it is always well to have the plate studied by one or more independent radiologists and their written opinions submitted to the company's attorney. The radiologists should be advised, at such a time, that they may be required to give testimony in open court upon their findings.

Periodical Re-examinations

By Ernest W. Miller, M.D.

Chief Surgeon the Milwaukee Electric Railway & Light Company

PERIODIC re-examinations should be undertaken from the standpoint of the benefit to the individual, whether made for the corporation, a benefit association or by an individual physician as a purely personal professional matter, since improvement in the physical wellbeing of each individual as a cog in the wheel of industry will mean added efficiency to any industry.

Physical examination for employment has become quite universal among larger industries. The Milwaukee Electric Railway & Light Company has for twelve years, to my personal knowledge, required physical examination for employment of all trainmen, and I am told that such examinations date back approximately 20 years. A definite amount of work has been done on re-examination, but not in any sufficient amount to warrant tabulation of statistics.

The physical re-examination of employees may be divided into (1) the scope of the examination, (2) the analysis of the findings, and (3) the disposition of the defective.

The scope of the medical examination should not present any possibilities of argument, yet many so-called thorough physical examinations are frequently cursory affairs, and the individual who has submitted himself to examination leaves the office of the physician with a feeling of false security. As chief surgeon of the Milwaukee Electric Railway & Light Company, with an employed personnel of over 5,000 and a well-organized Employees' Mutual Benefit Association, we have possibilities of knowing more about the physical wellbeing of our employees than some concerns which have undertaken systematic periodic re-examinations. The close personal contact of the medical department with the employed personnel has been for some years past a source of great gratification to me. We learned very early in the existence of our benefit association that preventive medicine could best be practiced by taking medical care to the individual rather than permitting the individual to seek medical care, and by this means alone the days disability per member per year were reduced 50 per cent during the first three years of the operation of our benefit association.

Our next great step has been the extension of medical and surgical service to the members of families of our employees. Frequently through this channel have we been given information concerning incipiencies of conditions which might have been most difficult to determine by physical examination. This contention is borne out by the marked reduction of days disability per member per year, since the introduction of preventive medicine to the members and the medical and surgical service to families of married employees. I do not in any way wish to detract from the advantages of physical re-examination, but merely cite the possibilities of the plan of procedure as we have developed it.

If any corporation is to undertake physical re-examination, every known means of diagnosis must be available. Not many years since a physical examination could have been called complete which today would be considered less than cursory. A complete history, in my opinion, is as essential as a thorough physical examination. In suspected cases, the X-ray examination would be paramount. Obscure gastro-intestinal cases, as well as chest cases, must necessarily be fluroscoped and plated. Many cases would require a blood Wasserman and some cases both blood and spinal Wasserman. Routine urinalysis need not be mentioned seriously, since no examination would be complete without both chemical and miscroscopic urinalysis. Examination of the teeth must be made in the light of our knowledge of focal infection, and in doubtful cases the examination should be referred to a dentist, who in turn may demand dental X-ray, dental transillumination, or any other modern means of dental diagnosis.

The history in any given case may lead us to some premature conclusion, which can be substantiated or disintegrated by the clinical and laboratory examination. Too often are we misled by the history of a case and often influenced in our physical examination, as well as our conclusions.

My early experience in the industrial medical world was among foreigners, with whom I could scarcely converse at all, and physical examination with all the means at my command at that time for diagnosis were necessary. I have always felt that this early training made for better final results to the patient, since it was necessary for me to make all examinations with an absolutely open mind and uninfluenced by any history. However, with the added advantages of laboratories, X-rays, etc., I believe it is an easier matter for the medical man of today to make physical examinations without prejudice and without being influenced toward any one pathological condition which he may suspect from the history.

The Analysis of the Findings

Subsequent to a complete physical examination, supplemented by all the diagnostic adjuncts, we have a second problem which confronts us, namely, that of the analysis of the findings of the examinations. It would be wholly unfair to the examining physician or to the patient to draw a snapshot conclusion as to the findings.

My plan of procedure subsequent to examination of a group of employees would be to have each case carefully analyzed in conference between the examining physician, the surgeon in charge of the corporation, and in many instances, the added knowledge of the individual in charge of personnel relations. Needless to say that the chief surgeon of any corporation of size cannot make the routine physical examinations, but his experience should lend itself in conference to the findings of the examining physician for a final determination of the existing conditions. At this time the character of the work of the individual should be considered and his home conditions should be understood, since too often conditions which on the face of them seem to be purely physical are the results of home conditions, financial worries or other matters which no medical history would necessarily bring forth. The habits of the man which should be incorporated in the history may well be studied in conference. This is especially true of our younger employees, as we are quite thoroughly familiar with the habits, etc., of our older employees.

One of the most difficult conditions to analyze, in my experience, has been what is so frequently called "man failure." I have never been able satisfactorily to dissect or analyze this particular condition. Men who have gone along for years as trusted employees in our public utility, whose accident record has been clear, whose physical condition has been excellent and whose home surroundings, we have every reason to believe, are of the best, now and then have a bad accident, which after the most careful analysis has been attributed to "man failure."

In dealing with public utility employees a factor which plays a large part not only in our own physical well-being but also in the safeguarding of the patrons of a public utility is the "human element." This human element may be a pathological condition, and I shall be very much pleased if some one will assist me in the proper analysis of the physical findings in any given case, so that I may be able to determine the existing human element in any given individual.

It may be true that in respect to the problems presented by "man failure" and "human element" it will be found of large importance to make use of the social facts which can be contributed by the personnel relation representative, by foremen and by others who have intelligent knowledge of the habits and living conditions of those who present such problems.

The Disposition of the Defective

Having carefully analyzed the results and findings of the physical examinations, the most serious problem of all confronts us for solution. Public utilities must be operated, and, with all the regulations which surround us, it is sometimes quite difficult to maintain operation. Doubtless there are many employees who are working daily with a full knowledge of their condition and of the fact that their employment is a serious drawback to their physical recuperation, yet in many instances their family at home, or other conditions, make demands which spur them on to greater activities, in order to cope with the complexities of our life of today.

All of us who have had experience of any length have met this problem, knowing full well that it is to the best advantage of the given individual to cease work entirely, yet he pleads for an opportunity to maintain his position in the industrial and social world. Change of employment from one field to another looks simple on the face of it, yet too much change seriously hampers the effective and efficient operation of any public utility. With unlimited means and unlimited men, there are many theoretical dispositions of this problem, but a practical disposition is one which I am not in a position to offer for its complete solution. One individual, or two individuals, can be easily disposed of, but it is safe to say that 2 per cent of the employees of almost any concern should not be allowed to work for a given period of time, subsequent to any thorough re-examination, and in all probability from 5 per cent to 10 per cent would be materially benefited by a change in occupation.

It seems to me clear, however, that the disposition of defectives will be materially easier as accurate knowledge concerning their physical conditions is developed through periodic health examinations. Surely, with such increasing knowledge, at least the intelligent employees concerned can be the more readily convinced of their own personal interest to accept suitable changes in their employment. In other words, the educational methods to be adopted may be more clearly indicated by such extensive and accurate knowledge than could be the case without the information gained by such periodic re-examinations.

I am certain from my own personal experience that cold-blooded, blunt decision in any given case will result only in a deleterious effect upon any well-organized medical department of an industry, until such time as the employed personnel has been sufficiently educated to understand the full meaning of re-examination and to realize fully the benefits to be derived therefrom and further education has been undertaken to dispose satisfactorily of conditions which may be discovered through such re-examination.

It is most natural that subsequent to re-examination of any group, in the event of change of occupation or request to cease work even temporarily, the reflection of the individual in question will rest on none other than the head of the medical department, whether the individual be advised of the condition which exists and the benefits to be derived by cessation of work or change in occupation by the head of his immediate department, the chief executive of the given company or the head of the medical department itself. The unthinking and uneducated individual immediately reflects his condition upon the results of the physical examination of the medical department.

I am heartily in accord with any complete physical re-examination which may be instituted, provided all of the means of diagnosis are available, provided sufficient time can be given to the analysis of the findings and provided sufficient education is forthcoming to make voluntary examination and disposition of defectives a popular procedure with the employed personnel of any industry.

Hospital Associations

By H. M. Bascom, M.D.

Chief Surgeon Illinois Power & Light Corporation, Peoria, Ill.

ACCIDENTS, industrial diseases, sick benefits, health insurance and compensation acts demand that the managers of all operating companies pay close attention to the physical conditions of their employees. Examinations of applicants for employment will save many dollars in claims later. Re-examinations are necessary in railway work, especially for sight and hearing.

The organization of hospital associations helps to keep the management in touch with the employees, so that loss of time can be averted. After reviewing the work of a good many hospital associations, we are more than satisfied with the Illinois Power & Light Hospital Association, organized by the Illinois Traction System for its several properties seventeen year ago, and now operating over all the properties of the Illinois Power & Light Corporation, having over 3,800 members, and constantly increasing. The employees contribute each month to the association, paying 1 per cent of the first $100 of wages and ½ per cent of all amounts above $100, with a maximum of $3.50 a month. All the employees of the Illinois Power & Light Corporation and Illinois Traction, Inc., are eligible to membership in the association, examination having been made before employment.

There are two separate features to membership, namely, medical and surgical benefit, and death benefit and total disability fund. The former provides for care in case of sickness or injuries received while not on duty; the latter provides $1,000 in case of death or total disability. The medical and surgical benefits of the association include (a) medical treatment with medicine during sickness, (b) hospital treatment when deemed necessary by

a regular hospital association physician or surgeon, by reason of sickness or of accident not covered by a compensation act, (c) surgical treatment when necessary by reason of sickness or accident not covered by a compensation act. This is in addition to any amount the employee might receive from usual compensation for such disability.

No payment is made for time lost during sickness, and the local physician determines the ability of the employee to return to work.

The results obtained from such associations are many. The average employee fears loss of employment, sickness and poverty of old age. Statistics show that 95 per cent of workmen are dependent at 66 years of age. Membership in the association brings the employee and employer nearer together. A satisfied employee is a better workman and less liable to accident than one who worries all the time. If in case of sickness he knows he will be provided for and some one is looking after his health he will be fewer days off the payroll. The labor turnover will also be less. The death benefit and total disability provide a fair amount to him for the future.

We make contracts with local hospitals instead of operating our own, believing it is for the benefit of the employee and any one injured on our right-of-way to be transferred at once to the nearest hospital.

◆

Pelvic Fractures

By J. A. Watts, M.D.

San Antonio, Tex.

THIS subject is of growing importance by reason of present traffic conditions. It divides itself into two general classifications, i.e., fractures of one part of the pelvic bone, without loss of the weight-bearing pelvic ring, and fractures of bones, with loss of the pelvic ring support. Both bring about instant complete disability, pain, deformity and shock.

The cause of pelvic fractures may be direct violence from a blow, or crushing injuries, such as automobile accidents, train or street car accidents, or it may be indirect violence such as a fall from a height, this violence transmitting through the thighs. The treatments recommended are: (1) Swathe with sling on Bradford frame, (2) long wooden splint from asilla to heel, (3) Bradford frame and weight extension, and (4) wiring, where comminuted with great deformity.

The following conclusions may be added: (1) That we are prone to expect discouraging results; (2) that disability periods given in these cases both total and partial are too long; (3) the most important point to my mind is that in an examination of a patient's terminal X-ray picture. We are prone to be guided by the amount of callous formation at the site of the fracture in gaging the firmness of union, losing sight of the fact that not much callous is thrown out in this region, and union is a great deal firmer than the picture as taken would indicate.

Co-operative Industrial Hospitalization

By Frederick S. Macy, M.D.

Medical Director the Brooklyn-Manhattan Rapid Transit Corporation

THE progress of civilization has been marked more by increased consideration on the part of the fortunate for the unfortunate than by any other one characteristic, and the tendency is growing to accept as an article of social faith a belief that those who have are under a certain obligation to foster the welfare of those who have not. Charity is beginning to mean not mere tolerance and giving, but the conservation of human energy, emotional, material and spiritual, and implies no shame, for there is no man who is not an object of it.

Probably the greatest necessity at present is the strictly industrial hospital. There are comparatively few workmen who can afford to pay from $25 to $100 a week for private service, or even the modest sum demanded for a bed in a ward. When the workman is ill his pay stops, generally, not only because of the necessity that drives his employer but because of the fact that otherwise many men would never be well enough to work at all. The employee who first weakens and then falters drives on until utter incapacity or constant pain forces him to a physician. Probably he has waited too long, but the rent had to be paid and the children fed and clothed, and he worked as long as his hands would answer to his will. In the meantime, his savings for a home or the education of his children are drawn upon for the supply of daily needs in addition to the cost of illness. Often the end of the hopelessly ill, is the charity ward, the public aid societies, the street and the poorhouse. The general public may think these are extremely rare cases. The social service department of every corporation knows they are not.

This is where the strictly industrial hospital comes in; not as a complete solution for all problems, but as a step toward it. The necessity for it implies neither incompetence nor uncharitableness on the part of other hospitals and the medical profession. The industrial hospital would supplement both, working with them instead of against them. It would minimize the drain of free wards upon the slender purses of hospitals in general, which are so seldom self-supporting that when one is it becomes an object of curiosity. On the other hand, the workman who could afford to pay for hospital treatment and preferred to go to some other than the industrial hospital could still do so.

Many corporations are already doing a great deal in this direction. The company which I have the honor to represent, as one example, conducts dispensary service for the care of both disease and injury. It employs a staff of physicians to visit and treat employees ill at home if such care is desired. It co-operates with family physicians and hospitals. In spite of receivership and adverse municipal conditions, it has spent enormous sums annually in sheer gratuities to employees, pensioners and families. Yet the misery and want that still daily appeal to it are financially beyond the power of its most generous impulses to relieve.

Even very large corporations have had to abandon hospitals of the conventional plan and scope after actually operating them because of the expense. But those of us who have had experience in hospital management know that the greater the number of occupied beds, if other factors are equal, the less the proportionate overhead is, and it is not unlikely that a hospital comparable with the best and even prepared to assume at least a portion of the tremendous burden of civilization that this proposal contemplates could be adequately supported by the co-operation of several companies, for not only would the cost of maintenance diminish proportionately as the number of occupied beds increased, but the available resources should increase in a greater ratio than the number of patients.

Such a co-operative industrial hospital could supply medical and surgical service to the employees of the co-operating concerns and possibly of their families, could study industrial diseases and injuries with the aim of reducing compensation losses and increasing the profits of production, could examine applicants for employment and re-examine all employees at suitable intervals and could care for crippled and pensioned employees possibly at a colony or camp in the country.

Outside of the contributions from member corporations for the support of such an institution, there are the following possible sources of revenue: Regular hospital rates to be paid by members for the care of their compensation cases admitted to hospital or camp; such fees as could justly be collected for the care of employees' dependents, if they preferred this hospital to others or if necessity forced them to it; fees for hospital care paid by benevolent orders in the case of employees who belonged to them; returns, if any, from agriculture and other activities of the vocational camp; donations, and the profits of "drives," as in the case of other hospitals.

Nothing a corporation could possibly do in any other way could gain for it such a large measure of public confidence and good will, even affection, as identity with such an enterprise would bring it. Nothing could so enhance the standard of loyalty and general excellence of its employees, or bind them as firmly to it in time of stress. As for science, such an institution would do far more toward standardizing industrial medicine as a specialty than any college or school could ever do. As far as the community is concerned, it would furnish a stronger guarantee against strike disorders and anarchy than any other single influence.

Perhaps the ideal could never be attained. The best that could be done might be only the subletting of a ward in a pre-existing hospital. But the ideal is an admirable objective, whether it be in matters of relief or in doing.

Medical Survey of Employees

By Alden Coffey, M.D.

Chief Surgeon Northern Texas Traction Company, Fort Worth, Tex.

Although in the past we have always had a very rigid entrance physical examination on the Northern Texas Traction Company, and have rendered medical and surgical treatment to the employees to the best of our ability, we have occasionally found some of them suffering with a disease that could have been diagnosed earlier and probably responded to treatment better. We have also found that quite a few employees are not prone to consult any doctor so long as they do not suffer pain or are not incapacitated for work. There are perhaps other good reasons, but the above were sufficient to incite us to begin our first medical survey this year.

The percentage of our finding, as shown in the accompanying table, may seem to be rather large, or perhaps we have not been as thorough in our entrance examination as we should have been, but we believe that our percentage is about the average.

To make a proper medical survey of employees of a street car company we mean to make an individual study of every employee regardless of what position he may occupy. This is important in order that we may arrive at an average of each ailment that affects the men as a whole, or affects employees of different departments, or to determine if there is an occupational disease among them due to their environments or work. Again, by this survey we are able to determine the loss of time of each individual and what we can do to prevent it.

The classification we have arranged is as follows:

Class A, men without defects or diseases.

Class B, defects or diseases of slight importance.

Class C, defects or diseases which handicap them temporarily and should be corrected.

Class D, defects or diseases which handicap them permanently but still able to work.

Class E, defects or diseases which render them unfit for work.

Class A is self-explanatory, and in this class we find very few, as will be shown later in the figures of our survey.

Class B are those with diseases of slight importance, such as bad teeth, enlarged tonsils, slight varicocele, slight defects in hearing and vision, relaxed inguinal rings, slight varicose veins. In our survey we find the largest per cent in this class. This we believe is due to our strict entrance examination and follow-up system of medical attention during the past fifteen years, in spite of the fact that our average age this year is 44 in comparison to an average age of 37 or less during the past five years.

In Class C we place those men who are suffering with acute troubles which temporarily renders them unfit for service and which are readily amenable to correction. This will include acute tonsillitis, crystatis, acute conjunctivitis, acute food poisoning, boils, abscesses, bone felons, bad pyorrhea, acute appendicitis, skin diseases and venereal troubles. In this class we will add moderate defects and slight injuries such as hernias, burns, simple fractures, lacerations and contusions.

In Class D are found diseases of more importance, on account of their being permanent in the individual. This also includes those diseases of an insidious nature which gain a foothold before their presence is apparent to the individual. Some are as follows: Bright's disease, diabetes, symptomless heart disease, hypertension or high blood pressure, chronic stomach or intestinal troubles, tuberculosis and such defects as bad hernias..

The last class, or Class E, takes in diseases or defects that render them unfit for work, and in that we place those men who are suffering with any of the above diseases or conditions in an advanced stage, mental disease such as insanity, and diseases and conditions incident to old age. In our survey there occurred only two in this class, and they of course were relieved from duty permanently. One was due to insanity and the other to senility.

Department Heads Examined First

In attempting a medical survey of this character the first and most important requisite is co-operation on the part of the men and officials of the company. It is a matter of education particularly on the employees' part, because there are always a certain few who are suspicious of any activities sponsored by the officials of the company. They will think, perhaps, that the company is trying to arrive at their true condition so they may be replaced by others, but such action was never contemplated in this survey. In overcoming this and other objections which were raised we carried on an educational campaign before beginning the actual physical examinations. This was accomplished by a series of meetings of the heads of the different departments, at which the plan was fully outlined by the officials and the members of the medical department. It was then carried to the men in open meetings, the plan fully explained, the individual personal benefits to be derived therefrom, and their hearty cooperation was evidenced in a very gratifying manner by the number taking the examinations.

The men were taken by departments, the heads of departments being examined first, and an effort was made to impress them with the thoroughness and importance of such an examination, so that they in turn would "sell" the idea to the men under them. In the examination, the men were admitted, registered and sent to the laboratory, where a complete blood count and a routine urinalysis were done. Following this the eye, ear, nose and throat specialist carried out his examination and on his special form entered his finding. Finally the general physical examination, including a complete family and personal history, was carried out and a record made on convenient form, which can always be referred to for after-treatment.

In the nearly 400 men examined, we found 1,092 defects or diseases, or 3.03 defects per man, as follows:

	Per Cent
Nose and throat	21.3
Digestive system	14.8
Eyes	13.6
Ears	11.6
Miscellaneous hernia	10.2
Mouth	9.3
Cardio vascular	7.3
Genito urinary	7.1
Skin	3.0
Respitory	0.8
Mutilations and deformities	0.8
Nervous system	0.2

It is interesting to note that 46.5 per cent of these defects were found by the eye, ear, nose and throat department, 3 per cent by the laboratory and the other 50.5 per cent by the general physical examination. Although only 3 per cent of these were brought out by the laboratory, this department should not be underestimated, as the most serious diseases are usually discovered in the laboratory.

The examination as conducted showed the men to be in the following classes, as given below:

	Per Cent
Class A	2.2
Class B	45.5
Class C	43.3
Class D	8.5
Class E	.5

We consider this a very excellent showing on account of the age of the men examined, as referred to earlier in the paper.

The number of deaths during the past five years has been 14, with the following causes: Bright's 4; tuberculosis, 3; cancer stomach, 2; apoplexy, 2; spinal menengitis, 1; acute indigestion, 1; murder, 1.

It is very readily seen that the first four diseases, which were responsible for eleven deaths, might have been prevented, or at least the disease held in check and life prolonged, had there been a comprehensive survey 5 or 10 years ago. This point can be shown by the fact that our examination showed there were 3.3 per cent with nephritis in a stage which can be benefited by treatment and which is now under treatment, also we found 0.6 per cent with active tuberculosis. 0.6 per cent with suspected turberculosis. Hypertension or high blood pressure showed 7.8 per cent. In a few years from now probably the same number of men would die or be beyond treatment.

This paper concludes those presented at the medical and surgical session of the Claims' convention. Papers presented at other sessions appear on the following pages.

Automobile Hazards*

By Charles B. Hardin

General Claim Agent United Railways Company of St. Louis, St. Louis, Mo.

In St. Louis Street Car Accidents with Automobiles Have More than Doubled in Five Years—Courts Are Getting Farther Away from the Doctrine of Imputed Negligence

IN THE year 1918 my company had 13,730 accidents reported, of which 4,698, or 34.22 per cent, were with automobiles. In the year of 1923 we had a total of 25,349 accidents reported, of which 12,609, or 49.74 per cent, were with automobiles. You will note an automobile increase of 12.76 per cent of our total. Many other claims men reported a similar condition. Thus you see it is a very live subject with us.

How to combat this hazard is uppermost in our minds. Most of our trouble comes from four sources. First, the partly or wholly intoxicated driver. Second, the under age driver. Third, the Saturday afternoon and Sunday driver. Fourth, the physically disabled driver.

The first class mentioned can best be reached by the enactment of proper laws and the strict enforcements thereof. The second class needs proper educational work among the parents. We should inform them of the law, for many of them are ignorant of it, and hold before them the sureness of punishment of their offsprings if a violation is detected. The active co-operation of the police department, the newspapers, the safety councils, can be enlisted in this laudable work.

The third class congest and "infest" our thoroughfares on the first and last days of the week, and not being experienced by daily driving and thus not capable of proper actions when an emergency arises, load us up on Monday mornings with an unusual number of catastrophies involving not only the chauffeur but his family and very often his neighbor's family.

The fourth class is likewise very numerous. Unless there is a statute regulation requiring a certification of ability which is based upon a careful physical examination, we have no relief from this cause. We should advocate the enactment of such a statute in our various states and should watch its enforcement. The examination should be a thorough physical and mental one. I have added "mental" because some persons who own and operate automobiles, are not mentally balanced. I know of one man living in our city who is subject to epilepsy, yet he drives an automobile and has had one fatal accident. We have no legal way of keeping him off the streets.

Our greatest "hazard" is the crossing accident. Arkansas has recently enacted a law requiring motorists to "stop, look and listen," at all railroad grade crossings, and as a result of a safety conference in Ohio recently a somewhat similar law will be proposed at the coming session of that state's Legislature. Another serious hazard is the "parking hazard." The ideal remedy is prohibition of all parking in the congested district and on busy car line streets between the hours 7 a.m. to 7 p.m.

With the large increase in the automobile accidents comes a corresponding increase in litigation. At present almost 37 per cent of our litigation arises out of automobile accidents. In the year 1918, 14 per cent of the money we paid to obtain all classes of releases went to automobilists, while in 1923, 29 per cent was so expended. The increase in damage litigation has caused an increase in trial courts to hear the same, and our Appellate Courts are crowded, resulting in the appointment of commissioners or the adoption of other makeshifts to assist the regular judges. What is the result? An inferior quality of production, of course, consisting of inaccurate and ill considered opinions not in harmony with the law as expounded in prior decisions and leaving us in a state of uncertainty what to do and increasing our expenses enormously.

We seem to be getting farther and farther away from the doctrine of imputed negligence in our jurisdiction. Our courts have even gone so far as to hold that the contributory negligence of the chauffeur cannot be imputed to the owner of the automobile in a suit filed on his behalf for recovery of damage to his automobile if the chauffeur was not acting as the agent of the owner or was not on the owner's business at the time the damage was suffered; that the status of the owner and chauffeur is that of bailor and bailee, and in the absence of knowledge of the inefficiency of the bailee in his use of the automobile the bailor can assume that the bailee will conduct himself carefully and prudently. See Stoeckle vs. St. Louis & Hannibal R.R. Co., 258 Southwest, 58.

We must recognize the fact that the automobile as a pleasure and business vehicle is here to stay, and that the saturation point has not been reached, so we will see our streets and roads more congested for some time to come. Therefore, it is our duty to increase our efforts along the lines of safety, work with and among our co-employees, work with the constituted authorities for law enforcement and support liberally and work with the various safety councils. While we cannot hope to eliminate the automobile "hazard" through these various channels we will be able to lessen it.

Automobile Hazards Discussed†

By Harrah K. Bennett

Safety Manager United Electric Railways, Providence, R. I.

Automobile Parking in Congested Streets, Careless Operation at Cross Streets and Incompetent Drivers Are Conspicuous Hazards, Suggestions to Reduce Danger Offered

THE Rhode Island registration of automobiles rose from 16,362 in 1915 to 108,160 in 1924. The use of city streets as garages is one "hazard" that must be eliminated. In the city of Providence, on the principal street, a one-way street, parking is allowed on both sides while in the center is a car line. Imagine how fast traffic proceeds. Add to all this the fact that through the business section serving the principal stores, the width of the street averages 24 ft. and what a picture of confusion confronts us. With a 60-minute restriction of parking, which is openly violated, the picture does not clear. On June 17, 1924, the revision of the city ordinance went into effect and provided, among other regulations, an all-rolling period between the hours of 4 and 6:30 on the principal thoroughfares of that city. Previous to this, automobiles were entirely excluded from certain streets. The result of this has been that there is a great dimunition of traffic congestion at several points, one prime feature attained in the all-rolling scheme being that vehicle and street car traffic travel, in nearly all instances, in the same direction, there being few places where one class of traffic is going against the other.

One great "hazard" is that vehicles entering from a right-hand intersection have the right of way. By no stretch of the imagination can I conceive a more dangerous rule. Parking at corners, parking just around a curve of a street railway track in another street, allowing automobiles to pass on the left of electric cars on streets having one or two tracks in the center of the highway, are also dangerous "hazards."

The intoxicated individual who used to "blow out the gas" but now "steps on it," unregistered cars, unlicensed drivers and drivers under age have also added to the colossal growth of the automobile menace.

As to the point of saturation in this industry, statisticians agree that there are between 24,000,000 and 25,000,000 families in the United States at the present time, but common sense says that every family in the United States cannot own a car. Statistics also show, there are only 225,000 people in the country who have incomes of $10,000 a year or better, and few people getting less than $10,000 a year can afford to keep two cars. The writer assumes that the highest estimate of saturation, therefore, is somewhat under 25,000,000, but more conservative persons have placed it at 16,000,000.

---

†Abstract of formal discussion before the annual convention of the American Electric Railway Claims Association, Atlantic City, N. J., Oct. 6-10, 1924.

All this leads to the important question of how we can best keep a step ahead in so far as accidents are concerned in order that, although the motor vehicle may increase materially, the accidents and fatalities may decrease. To my mind, the street railways must co-operate with every agency that is working for the prevention of accidents. Each locality should solve its own problems, generally speaking, but there should be standardized recommendations looking to this end. The six traffic suggestions which are recommended by the traffic planning and safety committee of the National Automobile Chamber of Commerce are worthy of serious consideration by every committee. They are: (1) Deprive the careless motorists of their automobiles, (2) instructions in wet weather driving, (3) appoint traffic administrators, (4) better guardianship of children, (5) adjust headlights properly and (6) keep records of fatality causes.

A driver observing a red light regards it only as an indication that he must turn to the left. Red should mean but one thing—stop! The teaching of crossing and highway safety should be a part of the curriculum of every school.

◆

H. D. Briggs New Claims President

H. D. BRIGGS, the new president of the American Electric Railway Claims Association, has been active in the work of the association for more than fifteen years. During that time he has served on many committees, including the subjects and the executive committees, and while serving in the capacity of first vice-president of the association he contributed a series of articles to *Aera*. He has also written for the local New Jersey Section and has served that body in other ways.

Mr. Briggs' official position is assistant general claim agent of the Public Service Railway. His activities embrace all branches of claim work, including accident prevention. So he enters upon his duties as president of the Claims Association with broad experience and enthusiasm for his work.

Mr. Briggs entered electric railway work in September, 1902, with the Rhode Island Company, Providence, in the claim department. He worked through the various branches of the department, but specialized in the preparation and handling of litigated cases. Later he became claim agent of the property. Subsequently, he was made assistant general traffic manager in charge of freight and helped to coordinate the freight traffic of that company with that of the New York, New Haven & Hartford Railroad.

In September, 1907, he joined the forces of the Public Service Corporation of New Jersey as assistant general claim agent where his experience has been extended in the gas and electric claim work, although the bulk of his time has been put in the railway organization. Having previously taken a course in military training at Plattsburg he volunteered for service in the great war and was assigned to Fort Meyer, Va., but he did not get overseas, however, owing to the revolution in Russia and the withdrawal of that country from the conflict.

Mr. Briggs was born in 1879 in Hopkington, R. I. As a youth when not at school he worked some years as a clerk and later as a bookkeeper in a general country store. He next engaged in the bicycle business. He attended the Moses Brown school, a Quaker institution in Providence and was graduated from Brown University with the degree of Ph.B. in 1902. While in college he specialized in law work and after moving to New Jersey he spent a year in attending night courses at the New York University Law School.

In addition to his business activities Mr. Briggs has found time for fraternal and other work. In 1915 in San Francisco he was elected national president of Zeta Psi Fraternity with jurisdiction over the affairs of its chapters in the United States and Canada.

Railway Crossing Accidents[*]

By H. A. Rowe

Chairman Committee on Prevention of Highway Crossing Accidents
American Railway Association

In Spite of Their Right-of-Way, Railways Have a Responsibility to Do What They Can to Make Crossings Safe —Helpful Suggestions Made

IT IS my pleasure to be quite at home among you as my early experience as a claim man was obtained on the Brooklyn Heights Railway. Our street railways had crossing problems then, but of vastly different character. Our claim disbursements at that time for crossing accidents were but a moiety of today's.

Let us start off with an understanding of what we mean by a crossing accident. It is my conception we are referring to collisions between vehicles operated upon rails by a duly franchised carrier for hire, and travelers either pedestrian or vehicular upon a public highway intersecting the tracks of the carrier.

Primarily man by the repetition of numberless footfalls prepared the beaten path for his convenience in going from place to place. The use of beasts of burden, the invention of the wheel, the development of the cart, wagon and coach, demanded improvements and extensions of his beaten path, resulting in roads and highways without number.

The past century gave us probably the greatest of all useful inventions—the steam engine—and man was obliged for its development and his personal protection to relinquish some of the rights coming down to him through custom from past ages and permit the iron horse to establish and maintain its right of way over highways and byways through the length and breadth of nations. These rights of ages were not given up entirely, however.

We have the primary right of the traveler to the use and enjoyment of the highway, plus the inherent and legal right of the carrier for hire to traverse the highway upon compliance with its fixed obligations to warn of the approach of its engines and cars. The American Railway Association, in its three recent campaigns, has forcefully stressed the necessity for unstinted performance of every duty by the railways and their employees as fundamental to crossing safety.

Where legal obligation rest upon the railroads to protect crossings by manual means, we should employ men for that purpose of a type commensurate with the character and extent of the highway travel. Where mechanical warning devices are used, they should be of a uniform, standard character, properly displayed and perfectly maintained. Necessary and desirable protective features should come in advance of legal or public demand. Constant surveillance of operating employees is necessary.

Co-operative relations should exist between the carriers and police, street and highway department and the local judiciary. The removal from the vicinity of railway crossings of distracting commercial advertising should be advocated. We should constantly urge higher standards of driving ability, the licensing of all drivers only after fair examinations as to physical, mental and technical qualifications.

The driver, owner and insurance carrier of every car involved in serious or fatal highway accidents should be obliged to report to his state department, that complete data as to the causes of such accidents may be obtained, means of prevention ascertained and the incompetent excluded from the highway. Automobiles approaching steam and interurban railroad crossings should be under such control that they can be brought to a complete standstill 25 ft. from the crossing. The red light upon the rear of an automobile should be abandoned and some other color substituted in its stead. Today a driver observing

Accountants' Association Proceedings

Better Classification of Operating Accounts Urged—Recommendations Presented for Closer Reconciliation Between Stores Records and General Ledger—Necessity of an Analysis of Maintenance Costs that Will Permit a Closer Check on Economy

AT THE opening session of the Accountants' Association Convention, Oct. 4, the first order of business was the reading of the presidential address by President E. M. White. An abstract follows:

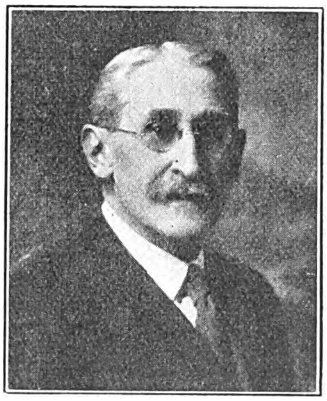
President's Address

We are today opening the twenty-seventh annual convention of the American Electric Railway Accountants' Association. At the last convention of this association the title of president was conferred upon me, an honor that I certainly appreciate. The association was organized in Cleveland, Ohio, in 1897 as the American Street & Interurban Railway Accountants' Association, and I have been a fairly regular attendant since the meeting in Boston, Mass., in 1898.

Possibly you may be interested in looking at a group picture taken in September, 1898, of some of the active members of the Accountants' Association. Look them over and see how many you know. Papers were presented on "Statistics, Their Use and Abuse," by E. D. Hibbe, auditor North Jersey Street Railway, and on "Car Mileage, How Arrived At and Its Use," by A. H. Ford, secretary and treasurer New Orleans Traction Company. There was also a report from the committee on "A Standard System of Street Railway Accounting." These features covered four sessions. An exhibit of blanks and forms was also a feature, more than 25 companies being represented. In the discussion on the classification, there seemed to be quite a difference of opinion on several points, one of them being "whether taxes and interest should be included in operating expenses or deducted from net revenue?"

The question of depreciation received no official recognition until the meeting in Columbus, Ohio, in 1906, and this was a closed meeting. In 18 years depreciation has grown to be a very live topic with accountants, but I regret to say that in practice it has not reached anywhere near 100 per cent. In other words, many still neglect to use it as they should.

Speaking of depreciation, we will all have to recognize it when we get into operating bus lines, for there we have an equipment that will not stand up for 20 years or more, even if properly maintained. There are several other points on bus accounting that I hope will be thoroughly discussed, and if the members have only thought and brought along their blanks on bus accounting we can all get some real good out of the convention. Here is where the "stay-at-homes," who think they can get it all from the report of the convention, lose out. Members, you cannot do it, you have got to be right in the convention hall and talk it out. Get into the spirit, which you can't do by just reading a report.



E. M. White
Retiring President

Another thing the "stay-at-homes" are going to miss this year is the practical demonstration of labor-saving devices for the office. Our work can be made much easier and can be done more rapidly as well as more accurately by adopting modern office appliances.

The program this year seems to me to be one that cannot help but be interesting to all. Members, if you have any thoughts on the various papers that are presented, please do not hesitate to get right up and tell us. It may start something, and that is what the papers are for.

The report of the executive committee was read by O. H. Bernd. In the absence of Executive Secretary J. W. Welsh, Mr. Bernd also read the report of the secretary. This report called attention to the various committee reports. It was pointed out that membership in the American Association also carries with it membership in the affiliated associations, so that all member companies can have representation.

W. L. Davis
President-Elect

In order to insure that some member of the accounting staff shall keep in contact with association headquarters, and receive all material it was urged that individual memberships be taken out.

The proposed code of ethics was not presented to the committee on policy of the American Association in time for action at the convention, so President White announced that it would have to go over for another year.

The report of the committee representing the Accountants' Association at the annual convention of the National Association of Railway and Utility Commissioners was read by Chairman W. L. Davis, auditor Lehigh Valley Transit Company, Allentown, Pa. An abstract of the report follows:

Representation at Conventions of the National Association of Railway and Utilities Commissioners

The chairman of this committee had made the necessary arrangements to attend the convention of the Utilities Commissioners in December, 1923, but on account of a railroad accident was unable to go. As no other member of the committee could make the trip, R. A. Freeman, of the accounting department of the Lehigh Valley Transit Company, was requested to do so and prepared a report, upon which this report is based.

In his opening address, President Lewis referred to the increase in the use of motor trucks and buses for freight and passenger service and the necessity for its regulation through the state commissions. There are at present only a few states where there is such regulation, and it is apparent that our association should continue its work in connection with a uniform classification of accounts for motor transportation.

The report of the committee on railroad service, accommodations and claims contains an item of interest to our association in stating that carriers often seek to credit a branch line with only the actual amount earned within its length. The committee suggests that the branch line should receive credit for a proportion of main line earnings, especially for that portion of the revenue originating at or destined to points on the branch.

From the report of the committee on valuation it can be seen that the National Association is following up this matter very closely. It appears that the steam railroads are now and will be in the future required to keep their accounts in such a way that valuations can be kept current by means of cost statements from carriers subject to supervision from regulatory bodies. It also appears that methods used by carriers in defending valuations of their own are being followed up. The committee has also directed attention to valuation proceedings in connection with lines which should not have been built and which could not, on any schedule of rates, earn a return on either original or reproductive values, stating that in such instances capital has been lost and valuations should reflect such conditions.

The suggested uniform law for motor vehicle regulation as submitted in the report of the committee on motor vehicle transportation contains provisions for annual reports, etc., as required.

The report of the committee on public utility rates emphasizes the necessity of reviewing in detail the operating expenses as reported by companies in determining the actual returns received on the property. Among the various items may be mentioned the following: Accounting in connection with depreciation reserves, particularly to determine whether the amount is excessive and the purpose for which the reserve is spent; exclusion from operating expenses of donations to educational and charitable institutions and for political purposes; survey of expenses in connection with advertising, and determination, from accounts, of any factor of inefficient operation or management.

The committee on statistics and accounts of railroad companies brought up a proposed revision of classification of accounts for steam railroads, a study of depreciation reserve charges and credits, a comparison of Interstate Commerce Commission requirements on depreciation and revised requirements in connection with intrastate statistical figures on interstate roads.

The report was signed by C. S. Mitchell, B. W. Fernald and W. L. Davis, chairman.

The report of this committee provoked a lively discussion. There was a general feeling that the time elapsed between the utility commissioners' convention and the A.E.R.A. convention is so long, being nearly a year, that much of the value of the information obtained by the representative is lost. Mr. Davis explained that he had attended the last three conventions of the utilities commissioners, twice as chairman of the committee, and once as special representative. In the meetings he had taken no active part, considering that, as an honorary member representing this association, it might be out of order to do so. He felt that the situation should be looked into and clarified. The report, he said, can be completed soon after the convention and subjected to such action as may be determined on by the association or its executive committee.

F. E. Webster, Massachusetts Northeastern Street Railway, considered that to have the report of these meetings available is a good investment by the association. He suggested that the report of this committee be put into circular form and mailed to the members of the Accountants' Association as soon as it is available. This was put in the form of a motion, which was amended to include the circulation of any reports referred by the executive committee and the president to Secretary Welsh. The amended motion was carried.

The report of the committee on standard classification of accounts was presented by Mr. Bernd in the absence of Chairman R. N. Wallis, treasurer Fitchburg & Leominster Railway. An abstract of the report follows:

Standard Classification of Accounts

The committee has considered with the bureau of accounts of the Interstate Commerce Commission such requests for rulings as have been submitted. In January, the division of depreciation of the bureau of accounts of the I. C. C. took up with the committee the matter of the brief previously filed by this committee concerning the determination of depreciation charges under section 20 of the transportation act of 1920. In the meantime the committee on national relations of the American Association had been following this matter with regard to railroads through the hearings at Washington. To avoid duplication of effort the work of the two committees in this matter was merged. With the approval of President White, W. F. Ham was appointed to represent this committee on a sub-committee of the committee on national relations which is now handling the interests of the association and industry with the I. C. C. with regard to required depreciation charges under the act.

The tentative classification of accounts for motor bus operation submitted by this committee to the last convention has now had the test of a year's use by such companies as are operating motor buses and are using this classification. A further discussion of the principles involved will assist in making changes which will give it a permanent form that can be recommended for our accounting to the Interstate Commerce Commission and other regulatory bodies.

The report was signed by R. N. Wallis, chairman.

M. W. Glover, West Penn. Railways, Pittsburgh, Pa., read a written discussion on the report, in which he referred to the tentative classification presented at the last convention, but stated that so far as he was advised no action had been taken and no uniform classification adopted. The necessity for this step, he felt, is evident to all systems operating buses. He urged that something should be done to provide for the members of the association a classification that could be used by electric railways and by independent bus companies as well, in order to secure uniform accounting and to make any statistics of motor bus lines of some value for comparative purposes.

Mr. Glover brought out that the classification mentioned in the report as being adopted last year was instead referred back to the committee for further action. The report of the committee was then received by the association.

The report of the committee on stores accounting, R. A. Weston chairman, was then presented.

Stores Accounting

Outlines and recommendations for closer reconciliation between the stores records and the general ledger were presented by the committee. It was recommended that all charges against the stock account of a local store should be permitted so far as possible to originate there and that all material issued out of stores on store requisitions should be credited to local stores account and charged to accounts benefited as shown on a monthly report from the local store to the accounting department.

Such a system would contemplate a monthly balance sheet being forwarded from the local store to the accounting department, starting off with the balance on hand at the close of the preceding month; to this would be added as debits all charges to stock during the month for purchase invoices passed, invoices for material received from other company stores, freight, express and cartage bills, labor charges from payrolls and materials returned to stores, once having been charged out.

Each of these groups would be shown in a detailed list showing the store department number for each separate charge to the stock account, thus enabling ready check by the accounting department. On the credit side of the balance sheet would be shown the stores issues for the month, material sold to outside parties and represented by bills rendered and materials transferred to other company stores. To illustrate the system outlined two sets of forms were shown in the report.

The committee favored the system used by a number of companies which periodically check a certain part of the stockroom and compare this inventory with the card or stock sheet record, reconciling the differences so found by a partial inventory adjustment. It also reported in favor of a complete annual inventory, even when monthly partial inventories are made, as it was held that a complete annual inventory brings to light many things with regard to the stock of unapplied material on hand that are not brought to light in other ways, and results in a thorough overhauling of stock and an improvement in the arrangement.

In the subject of rendering store distribution on charges to construction in such a way that the work of the fixed capital records department might be facilitated, the committee illustrated a form of summary sheet for material distribution in its report. Two forms of this character were shown as used by two different electric railway companies. There was included in the report a discussion of a detailed method of keeping store account records for preparing monthly classified material reports. Such reports are to show in cases of construction work deferred or suspended, the amount of material tied up, and to enable proper allowance to be made in considering the amount of the stock carried for maintenance and operation. The whole purpose of the statement is to serve as an aid in the control of the amount of the investment in materials and supplies.

The report was signed by C. L. Bartlett, A. E. Hatton, J. S. Pardoe and R. A. Weston, chairman.

In the discussion which followed, Mr. Davis stated that his company found it necessary to take an annual inventory, although it is taken by sections and not all at the same time. The inventory is adjusted to the various storeroom accounts and the general ledger accounts through a number of controlling accounts. On the subject of adding overhead or stores expense to the actual costs, it was brought out by T. B. MacRae, Chicago Rapid Transit Company, that the Interstate Commerce Commission accounting requires that this expense be charged into general accounts. He does not, however, agree with the I. C. C. and does not do this, the entire expense being charged monthly into an account known as storehouse expense. H. C. Moore, Jr., Richmond Light & Railroad Company, New York City, pointed out that under the telegraph code the I. C. C. does use supply expense loading and that the practice is thoroughly legitimate. Mr. Glover stated that while the I. C. C. does not specifically authorize the practice it cannot prevent it, there being a statement that companies are at liberty to distribute the accounts if they wish.

The minutes of the executive committee meeting held on Oct. 5 were then read and approved.

Executive Committee

The Accountants' executive committee reported that it had held a meeting on Oct. 5 at the Marlborough-Blenheim Hotel, with the following members present: E. M. White, L. E. Lippitt, T. B. MacRae, O. H. Bernd, E. H. Reed and J. W. Welsh.

On motion of Mr. MacRae, it was decided to eliminate the presentation of the new accountants' code of ethics from the program of the sessions of this year's convention.

A special committee consisting of M. W. Glover, general auditor West Penn Railways, chairman; J. M. Joel, general auditor New York State Railways; C. R. Mahan, auditor Chicago, North Shore & Milwaukee Railroad; N. E. Stubbs, auditor United Railways & Electric Company, Baltimore; H. G. Kimball, chief accountant Washington Railway & Electric Company; P. R. Jacques, auto and bus accountant the Connecticut Company, and C. W. Stocks, editor *Bus Transportation*, was appointed to prepare a standard classification for bus accounting. The activities of this committee will be distinct from the work of the standing committee on standard classification of railway accounts and will be directed toward other ends.

O. H. Bernd, secretary Des Moines City Railway, Des Moines, Iowa, was appointed convention secretary. Mr. Bernd was also made chairman of a new committee on freight accounting, and will appoint the other members of the committee.

I. A. May, the Connecticut Company, moved that with the appointment of the new committee on bus classification the question of bus classification be withdrawn from the regular classification committee. The motion was approved without discussion.

Upon motion by Mr. MacRae the scope of the bus committee was broadened to include all matters pertaining to bus accounting that the committee on the latter subject might take into consideration. This was deemed desirable so that all such matters would be considered by men thoroughly familiar with bus operation.

The following convention committees were appointed:

Nominations: M. W. Glover, chairman; E. A. Tuson, A. E. Dickson and W. T. Brown.

Resolutions: L. E. Lippitt, chairman; H. C. Moore, Jr., H. C. Kimball.

Tuesday's Session, Accountants' Association

FOLLOWING the session on joint engineering-accounting, which was held in connection with the Engineering Association (see ELECTRIC RAILWAY JOURNAL for Oct. 11, page 638), the accountants opened their session on Oct. 7, with a paper by Henry S. Day on the subject of segrations in cost accounting from the viewpoint of the manufacturer in reference to maintenance accounts. This paper is abstracted elsewhere in this issue. Mr. Day mentioned that the figures included in his paper had been taken from books of operating companies and that he could vouch for them.

In the discussion which followed I. A. May had the opinion that local conditions should be taken into account to a greater extent than was allowed for by Mr. Day. Mr. Day mentioned that allowance for differences in weather should be made in comparisons of maintenance costs, but did not believe that this would explain the great variations in maintenance costs of companies operating in adjacent territory. He feels that traction companies are facing a period in which they will have to change their maintenance methods materially in order to cut down operating costs. The I. C. C. classification, according to Mr. Day, does not lend itself well to close figuring, and he feels that the master mechanic or the electrical superintendent must figure costs down to details in order to tell where he is going. Last year, Mr. Day said, he went over some 50 railroads and found a wide variation in methods and an equally wide variation in the closeness with which the operating men could figure the true costs of the equipment.

Cost accounting came into its own in England during the war, according to Alfred W. Green, Metropolitan District Railway, London, England. People came to realize that cost accounting is most important, he said. To make comparisons it is important that all companies have a uniform cost system, else it is not possible to tell when one has efficiency. Mr. Green mentioned in particular the spirit of co-ordination and co-operation among American electric railway men, which, he said, was not so apparent in England.

The difficulty of keeping accurate maintenance accounts on a small road where motors, bodies, wheels and trucks are interchanged indiscriminately was described by C. E. Kohlhepp, Wisconsin Public Service Corporation. Mr. Day felt that despite difficulties accurate accounts should be kept. As a comparison of different maintenance practices, he referred to figures of $1,780 and $1,150, the actual costs for maintaining a car a year on two properties within 300 miles of each other. Local conditions, such as weather, were practically the same. But on the property where the costs were higher, the master mechanic did not know what his real costs were.

I. N. Merritt, city of Detroit, questioned the value of comparative cost figures, stating that conditions vary so that they are not valuable. Mr. Day replied that in many cases railway systems are not keeping accurate figures, and the comparison should provide the information to tell the officials what they are doing. He pointed out that many companies are doing manufacturing on a small scale, and figuring that they are making a profit, whereas if the proper overhead expenses were added, it would be found cheaper to purchase parts outside. In some cases where the job is specifically a railway shop job, such as turning wheels, Mr. Day felt that a cost analysis would show up an inefficient machine that was costing so much to run that it would be economy to throw it out and purchase a modern machine.

An illustration of this was given by E. H. Reed, Brooklyn City Railroad. This company had a new mechanical man look at armature practices. He found that to send armatures out to a winding shop to get them put in shape would show a saving of 30 per cent over having the work done in the home shop, regardless of overhead. As a result the armatures were put in good shape and the method of handling work in the shop was revamped, so that today more armatures are being handled than ever before, and at a lower cost.

Homer A. Dunn, Haskins & Sells, felt that more attention should be paid to the item of overhead in figuring shop costs. It is not a question of loading on everything that an engineer can think of, but of determining the correct figure.

PRESIDENT BUDD ADDRESSES CONVENTION

President Budd of the American Association addressed the meeting briefly, stating that he regards the accounting department as one that is almost more vital than any other, since the accountant is more responsible than any other for the morale of the organization. He should be the warning signal for slipshod, wasteful, inefficient or unbusinesslike practices. In addition, the accountant, and more particularly the engineer-accountant, ties in the executive with the business operations.

A paper on accounting as related to administration and proprietorship was read by Homer A. Dunn. An abstract of Mr. Dunn's paper appears elsewhere in this issue.

In the discussion the advantage of comparing two 12-month periods in addition to the current month and the corresponding month of the previous year as compared with the more usual method of computing the year to date was brought out by Mr. Dunn. He also called attention to the value of publicity in connection with the accounts of a company, not only once a year, but continuously.

Charles Roser, Public Utilities Bureau, Louisville, did not agree on the value of newspaper publicity. He outlined briefly the work of his bureau, indicating that it had assisted in improving the local utility situation. As to the inclusion of overhead in costs, he pointed out that this is dangerous when a valuation is in question, and hostile lawyers have a chance to examine the figures. He felt that all overhead should be absorbed in the final cost figure whenever it is possible for this to be done.

Mr. Sharp, Pittsburgh, proposed for the ensuing year that attention be paid to the establishment of committees on fixed capital records and on budgets. Mr. Glover suggested that the subject of cost accounting be added to those already mentioned.

In response to a query. Mr. Glover explained the work of the committee on bus accounting. This committee was appointed a year and a half ago but has taken no action during the past year.

The new committee, however, already has held a meeting, he said, and is inviting every company operating a bus, whether railway or independent, to send in any information or data that will help in getting up a standard classification that is satisfactory. This he hopes to have published in tentative form prior to the next convention.

Leonard Tait, manager London Street Railway, London, Ont., stated that similar work in classifying accounts is being done by the Canadian Association in connection with steam railroads and motor buses. He felt that by standardizing accounts under heads such as maintenance of equipment, transportation, car operation and general expense much unnecessary work will be eliminated.

Thursday's Session, Accountants' Association

THE session opened with the reading of a paper by C. B. Couchman, C. P. A. of New York City. His paper is abstracted elsewhere in this issue.

M. W. Glover, chairman committee on relations with other associations, reported that his committee had no duties assigned to it and for that reason had tendered its resignation to the executive committee. If it was desired to continue the committee it was suggested that the executive committee authorize the president to correspond with chairmen of the corresponding sections of the National Electric Light Association and the American Gas Association, with a view to determining if there are enough questions affecting the accountants of the three utilities to continue this committee.

Agreement with the report was expressed by F. E. Webster and C. E. Kohlhepp. T. B. MacRae proposed the inclusion of the accounting association of the steam railroads, but after some discussion the report was approved as presented by Mr. Glover.

Resolutions

The report of the committee on resolutions was read by Chairman Lippitt. The work of the officers of the American Association and of the Accountants' Association in preparing for the convention and securing speakers was commended.

Thanks were extended to the technical press for the interest taken in having representatives present at the meeting and in reporting the proceedings.

The pleasure of the association was expressed at having Messrs. Budd, Welsh and Green present at the meetings, and for the remarks made by them.

Thanks were extended to O. H. Bernd for his work as secretary during the convention.

The report was signed by H. C. Kimball, H. C. Moore, Jr., and L. E. Lippitt, chairman.

The report of the committee was accepted as read.

Chairman M. W. Glover of the nominations committee presented the report, after which the following officers were elected to serve during the ensuing year.

OFFICERS ELECTED

President, Wallace L. Davis, auditor Lehigh Valley Transit Company, Allentown, Pa.

First vice-president, John J. Duck, general auditor Chicago Surface Lines.

Second vice-president, L. E. Lippitt, auditor-treasurer Auburn & Syracuse Electric Railway, Auburn, N. Y.

Third vice-president, T. B. MacRae, general auditor Chicago Rapid Transit Company.

Secretary-treasurer, J. W. Welsh, executive secretary American Electric Railway Association, New York City.

Executive committee: O. H. Bernd, Des Moines, Iowa; E. H. Reed, Brooklyn, N. Y.; C. E. Yost, Wilmington, Pa., and J. E. Heberle, Washington, D. C.

President-elect Davis and the other new officers present made a few brief remarks, after which Mr. Davis presented the past-president's badge to Mr. White.

Cost Accounting for Electric Railways*

By Henry S. Day

Manager Transportation Division
Westinghouse Electric & Manufacturing Company,
Boston, Mass.

Henry S. Day

Electric Railways Require a Cost Accounting System Which Is Flexible and Comprehensive Enough to Inform the Executives of the Various Departments How Money Is Being Spent and the Results of the Expenditures

THIS paper has been written to bring to the Accountants' Association an operating man's belief that more cost accounting will help the electric railways. In any engineering project, construction program or operating plan, the engineer, contractor and operator are, to a large extent, dependent on the accountant, and no one of these is more dependent than the operator. The bigger end of operation is upkeep, or maintenance. The men who are responsible for maintenance spend their time turning dollars into material and labor, and the success with which they do this depends largely on whether the system of accounting shows clearly where and how the dollars go.

Few electric railroads have cost systems which treat maintenance costs as the manufacturer must treat his production costs. A street railway shop is chiefly concerned with repairs, and the men in charge of this work should know what these repairs actually cost. A superintendent of equipment should know when a motor or truck reaches the point where upkeep costs are entirely unwarranted. Approximate figures only keep him in doubt and uncertainty.

The same thing applies to bridges, track or line. Accounting must do more than this; it must, by exactness and thoroughness, show where one method is costly and where another is not. The correct methods cost the least in the end—and it is the cost in the end, as well as the day-to-day cost, that the accountant has to show up.

---

*Abstract of a paper before the annual convention of the American Electric Railway Accountants' Association, Atlantic City, N. J., Oct. 6-10, 1924.

The engineer and the superintendent, in keeping pace with development and design, constantly add new types of equipment, and to find out whether a new type is a success, must go to the accountant for the cost. If new equipment operates well and does not cost excessively it is a success; if it operates and does cost excessively it is not a success, and the accountant's figures hold the answer.

The electric railway may not need as comprehensive and elaborate a system of cost accounting as a strictly manufacturing plant, but it must have a system flexible enough and comprehensive enough to tell the man who is spending money for maintenance exactly and in detail how he is spending it. An operating official should be just as familiar with productive and nonproductive hours, overhead, obsolescence and depreciation as a manufacturer, and this information must come from the accountant. If the operator believes he can manufacture a part or make a repair cheaper than he can buy the part or send the repair work to be done outside of his own organization, because his prime cost of labor and material have been given an overhead charge of 10 to 35 per cent when it was actually 75 to 125 per cent, he cannot conduct his department efficiently, and this is not infrequently found to be the case.

It is not likely that the suggestions and criticisms contained in this paper will be met with the thought that to go into the detail of accounting suggested, the average road would acquire an additional expense to its present cost of accounting that would not be warranted. This is not believed to be so, and with the help of the many practical labor-saving devices that are available to the accountant today, it is the speaker's belief that a proper system of cost accounting would entail little additional expense, if any at all.

*Accounting as Related to Publicity and Administration**

The Accountant Mind, the Economic Mind and the Advertising Mind Should All Work in Harmony to the End that Political Demagoguery May Be Overcome

ELECTRIC railways have been greatly burdened with economic troubles during recent years and have been industriously engaged in efforts to meet them. Only a Gilbert and Sullivan operatic satire or a Shakespearean tragedy could do justice to their situation from a political point of view. Politicians keep themselves in the limelight by sensationalism. They find it expedient to play for votes by picturing utilities, and particularly electric railways, as seeking to crush the crowd under a juggernaut of iniquitous wealth and conspiracy. Whatever is sensational naturally appeals to the public press and so it is led into aiding and abetting.

There is no way to overcome publicity misinformation, other than by publicity of the facts. If you accept the conclusion that there is no other way, you should accept responsibility for full co-operation in the work. Development of ability to look upon the public as having a composite mind will aid in the formulation of financial and statistical data that will carry a correct and comprehensive message. The composite mind needs to be visualized as containing the angles of view that are common to the banker, the investor, the patron, and the government commission. In the patron you will find a large part of the crowd mind. When these have been covered in financial data and statistics, little will remain for the requirements of the manager beyond refinements for economic studies.

The formulation of financial and statistical data for publicity purposes, however, should not be entered upon in a haphazard way. It seems to me that it would be quite worth while for the electric railways to organize, at common expense, a permanent advisory bureau to make researches and to study the ways and means by which best to reach the minds of those whom I have enumerated. In order to be most effective, publicity must deal with facts in so simple a way and so directly refute demagogic misrepresentation as to carry conviction to the popular mind. It must be constant and persistent. The field is one for the play of the imagination and constructive genius of the accountant mind, the economic mind, and the advertising mind, all working in harmony to a common end.

As illustration of this method of preparing financial data one measurement might be in the number of dollars each of the several kinds of property and assets (some net) per $1 of long-term debt; another might be in the number of dollars of property and assets, after applying long-term debt against the property immediately securing it, per $1 of preferred capital stock, if any; and another might be per $1 of common capital stock and surplus. By comparison, growth in any and every respect could also be brought out. Measurement of administration in summary form could be worked out per $1 of long-term debt, per $1 of preferred capital stock, and per $1 of common capital stock and surplus. The patron mind might be reached by placarding the public investment, composed of long-term debt and all classes of capital stock and the surplus, and the per cent of return thereon, condensed operating and income data per $1 of such public investment, and also condensed operating and income data per passenger carried.

An advisory bureau might outline advance write-ups, in a manner in which they would be made by an experienced and intelligent financial reporter, to be given out to the press in conjunction with annual reports or at such other times as might be propitious. The bureau might give consideration to revisionary measures to be taken up with federal and state commissions. As one of the revisionary measures that need to be considered, there has been in my mind the excessive refinement in all commission classifications; totally unnecessary for the carrying on of commission functions. You will get my meaning if you will total the smaller items in each main division of operating expenses and divide the totals of such groups by the total operating expenses. If you have not already done this, you will be astounded by the small proportions which these computations will disclose. You may readily conceive that such a bureau should be composed of real experts working co-operatively. Wouldn't it save a lot of haphazardness of effort and be well worth the cost?

It is not possible to force upon any administrator or manager information or data that he thinks he does not want. Often, however, the desire may be created through practical demonstration. Experienced administrators understand the value of indices to uneconomic conditions, indices which point the direction of research for the discovery of the precise facts and the means whereby to stop waste or correct faulty practices. Let me suggest two such indices, based on some practical and agreed condensation of the voluminous detail of operating expenses. One would be a comparison of the percentage ratios of the several items to the total operating expenses, in months and in periods. Another would be to measure such items against like items for some period such as 3 or 5 years previous, according to the conditions. This measurement might be applied to both monthly and periodic expenses. The process would be to divide each amount by the amount of the like item in the basic period. The result would be to produce the amount of expenses incurred in the current period in relation to each dollar of like expense incurred in the basic period.

---

* Abstract of a paper before the annual convention of the American Electric Railway Accountants' Association, Atlantic City, N. J., Oct. 6-10, 1924.

Now about periods. Have you thought much about, or caused others to consider, the value of constant twelve-month comparisons as in contrast with comparisons for elapsed periods of fiscal years? If not, it is suggested as quite worth while to make the test with open mind. You may think that the constant twelve-month accumulation means a lot of work, but if you lay it out systematically at the beginning of a fiscal year, that thought will disappear after one year's operation. It involves only the subtraction of data for the oldest month of twelve and the addition of data for the new twelfth month. In the first year, the real work involved lies in the establishment of comparative data. It is obvious that at the end of the fiscal year the same data will be accumulated as if proceeding from the beginning of the fiscal year.

The graphic line of monthly revenue is not a tangent; it is afflicted with curvature or with peaks and valleys. You are all familiar with the established custom of distributively disposing of a lot of the more or less fixed or constant expenses for a year on the basis of time elapsed. A question for your serious consideration is whether or not the custom produces fair results.

I want to put into your minds the possibility of giving better service to the administrator and the proprietor. This will involve something like budgeting. Budgeting, as you know, is largely estimating, but it is always possible to progressively adjust toward actuality as the end of a fiscal year approaches, without serious distortion of the results for any month. If, at the beginning of the year, estimates are made of the more or less fixed items or constants which are to be found in maintenance and general expenses, if not elsewhere, and an estimate of the revenue by months also is made, the yearly estimates of the former can be brought into percentage relation to the yearly estimate of the latter. Obviously, the use of these percentages for the monthly charging out of such expenses would be to follow approximately the graphic line of the revenue.

You are all accountants of sufficient experience to understand the use of temporary accounts for actual monthly expenditures, and how the estimates may be revised and adjustments started or made as soon as comparisons may indicate need. You will appreciate, I feel sure, the advantages to the administrator and the proprietor of such a procedure over one involving the utilization of a permissive equalization account as a factor in operating expenses. With a proper clean-up or clearance at the year end it would seem that objection could not well be taken by any federal or state authority.

Balance Sheets*

By Charles B. Couchman, C.P.A.
New York

When Nature and Purpose of Balance Sheet Are Understood, Its Problems Become Easy—Treatment Explained of Replacements Made at Higher Cost

C. B. Couchman

THE importance of the balance sheet is being recognized more completely year by year. Its place in the business world today is many times more important than it was 10 years ago. The number of business men who look upon financial statements with indifference or even with disdain are rapidly becoming fewer. This change is brought about by an increasing realization of the fact that a balance sheet, instead of being a mere hobby of a group of hobbiests known as accountants, is in reality a document worthy of serious consideration by the business man for his own sake and the sake of his profits and his stability in business.

Without being too technical, it may be stated that a balance sheet as prepared in America today, gives a picture of two things. The right-hand side of it shows the source of all values that have come into, and still remain in, the business picture, and the left-hand side shows the disposition that has been made of these values. The right-hand or liability side may show that a certain amount of value has been received from various classes of creditors, a certain amount from stockholders and a certain amount has been accumulated from the operation of the business. The left-hand side shows that certain of these values are on hand in cash; certain are represented by collectible claims from others; certain other amounts have been paid out for the acquirement of various classes of property both floating and fixed; and still others for services yet to be rendered to the organization, such as prepaid expenses, or for services whose benefit either directly or indirectly is expected to apply to the future, such as organization or development expenses.

It will be noted that the question of whether these properties may have increased in value since their acquirement by the organization does not normally enter into their expression for balance sheet purposes. If circumstances arise justifying the expression among the assets of this increased value attaching to property during present ownership, it must be offset upon the liability side by some item such as "Reserve for Appreciation of fixed properties" so that the liability side may continue to picture the source of the asset values as we have indicated above.

It must not be overlooked that any increase in net worth of a business, as shown by a comparison of the balance sheets as at the beginning and as at the end of a period, must come from additional investment by stockholders, or must be attributed to some sort of gain or profit arising from the activities of the period, over and above amounts distributed to stockholders. Such gain or profit should be available either for distribution as dividends or for acquiring additional facilities for operation. If we allow the assets to be stated in the balance sheet at estimated cost of replacement, and if such estimated value is in excess of their real cost, we automatically add that amount to the surplus of the organization and thereby indicate to the observer of such balance sheet that the organization has this additional amount available for dividends or for expansion. Such treatment would result in a complete misstatement.

The mere fact that the purchase price of fixed assets has increased does not add one real penny to the amount available for distribution as dividends, nor to the amount needed for replacement in case such is a necessity. It is evident by the rules of common sense that the greater the increase in the price of the assets to be purchased, the worse off financially is that organization which must needs purchase them. To try to make such an unfavorable condition appear upon the books as a favorable one is as reprehensible a misstatement of facts as an organization could well make. If the organization is in that happy condition where it is not necessary to replace its fixed assets—all the more reason why a fluctuation in the market price of something which does not concern it should certainly have no place in its balance sheet.

The value of properties to be used as the basis for determination of a fair rate of return is frequently of great interest, not only to the organization owning the property, but also to the public receiving the service. Such value must be determined by careful survey of the relative efficiency of the properties to the purpose which they are to serve. But this value has no place in the balance sheet expression. To give effect to it in a balance sheet would result in a distortion of surplus and a misstatement of the results properly accrued from past operations.

You will note that we consider all investment in properties to be used as being somewhat akin in principle to investment in service prior to the actual receipt of such service. In other words, physical properties for use, such as the normal fixed assets of operating companies, are like prepaid expenses, save that they are represented by tangible properties rather than merely by claims for services. If an insurance policy for one year costs a premium of $600 the result of the transaction is the acquirement of an asset which at that moment may be placed on the book at the full value of the prepayment. Month by month, as the service for which this prepayment has been made is received, a portion of this asset is transferred to expense. The value of the asset, therefore, decreased $50 per month until at the expiration of the year it is reduced to zero.

---

*Abstract of a paper before the annual convention of the American Electric Railway Accountants' Association, Atlantic City, N. J., Oct. 6-10, 1924.

Similarly, an investment of $600 in a machine is little more than a prepayment for services. The period of service, instead of being exact as in the case of the insurance policy, is estimated. There is a further consideration of a possible salvage value at the expiration of the period of usefulness. If it be assumed that the above machine may be used for 10 years and still have a salvage value of say $50 then the actual amount of service cost or expense prepayment is $550 which must be spread over the years of use. It is not our purpose here to discuss the method of such depreciation or amortization. By the so-called "straight line" method the $550 would be spread equally over the years. The asset of $600 would thereby be reduced $55 per year. Instead of this reduction being applied directly to the asset value on the balance sheet as in the case of prepaid insurance, practical operation has shown the advisability of accumulating this depreciation in a separate account known as "Reserve for Depreciation" or (as is more commonly used in public service) "Accrued Amortization of Capital." This account should be deducted on the balance sheet from the asset to which it applies so that there may be shown the net amount representing the unamortized investment in the fixed asset.

The method of spreading depreciation or even of determining the right amount for periodic spread is difficult and uncertain. Two organizations may buy identical items of equipment to be used for identical purposes. The one through diligence may maintain this item of equipment in efficient condition for twice as many years as may the other, if the latter uses scant engineering judgment in its operations and is negligent of care and of repairs.

ACCOUNTING FOR BETTERMENTS

The principle with regard to the balance sheet valuation of fixed assets which we have been trying to enunciate may perhaps be illustrated by a problem of constant recurrence in organizations of public service character. I refer to the problem of properly recording the replacement and betterment of such assets.

The balance sheet expression of any fixed asset is the difference between two accounts, one of which represents its cost and the other represents the amount of this cost which has been charged to operations. If the asset should be eliminated from use, these two amounts must also be eliminated from their respective accounts. If the difference between them is in excess of the salvage or recoverable value of the asset, this excess must be charged to operation in addition to that which has been accrued in the past.

The question of replacement accompanied by betterment adds but little real difficulty to the problem. The simplest procedure is to consider such a transaction as consisting of two parts; first, the elimination of the old, and second, the acquirement of the new. The elimination of the old is accomplished by clearing the asset account and the reserve for depreciation account of such amounts as have been entered therein because of the asset removed. This journal entry is completed by a proper debit because of salvage value if any, and a balancing item to the operating accounts. Having cleared the old asset from the books, the new asset is recorded at its cost.

May we illustrate this by the assumed replacing of a light weight rail by a rail of say 30 per cent greater weight or efficiency. Assume that the replaced rails cost $100,000 and the new rails because of the higher price of steel cost $200,000. Certain organizations migh assume that since the efficiency is increased only 30 per cent the asset should also be increased by only that amount and should, therefore, appear upon the records as $130,000. The absurdity of such a method is quite evident at a glance. The amount representing the cost of the light weight rails should be eliminated from the asset accounts just as the assets themselves are eliminated from use. The new assets brought into use should correspondingly be brought into the records at cost. This cost becomes immediately the basis for future depreciation.

Like all other rules of accountancy those I have touched upon in this paper must be applied in practice with a due regard for common sense. Accountancy on the whole may be briefly summarized as being nothing more nor less than common sense used in the recording of business transactions, plus a knowledge of the principles which have been found through experience to be the fairest to all parties concerned in the preservation and development of commercial activities.

These principles are general and apply to all organizations regardless of their nature. Each broad class of commercial organizations has its own peculiar problems to which these principles must be applied. It may be broadly laid down as a fact that if any controlling powers such as the public service commissions of the various states or the various income tax departments dictate a policy or method of accounting which is markedly at variance with these principles, such arbitrary rules must sooner or later be amended to conform with general principles or truths. It is therefore more advantageous to study these principles than it is to discuss the particular requirements of any or all public service commissions. Such requirements may be changed at any time by a vote or a decision of the controlling body, but the basic principles of accountancy are the condensed expression of the accumulated experiences of business, and are not subject to change save as increased experience demonstrates the desirability of the change for the purpose of increased accuracy and fairness to the interests of all parties concerned.

W. L. Davis Heads Accountants' Association

W. L. DAVIS, the new president of the American Electric Railway Accountants' Association, is auditor of the Lehigh Valley Transit Company, Allentown, the Lehigh Valley Light & Power Company and affiliated companies. Mr. Davis has had a very broad experience in utility accounting. It dates from the time that he entered the service of the Ohio Electric Railway in 1906 as statistician with that company. Before that Mr. Davis was with Ernst & Ernst, certified public accountants in their Cincinnati office. For obtaining varied experience in accounting work there is perhaps no better place for a man to secure it than the office of the public accountant. The clients of the public accountant are drawn from all walks of business life, and the men who work for him obtain a broad view of accounting practices and details.

For six years Mr. Davis did about all the different accounting jobs that were to be done on the Ohio Electric Railway. Then the chance came for him to change to a field which promised greater opportunities to him and Mr. Davis became associated with the Texas Power & Light Company, Dallas, Tex., as traveling auditor. Soon thereafter he was made secretary-treasurer of the company. From 1914 to 1915 he was auditor of the Southern Traction Company and the Texas Traction Company, both of Dallas.

From this post Mr. Davis went to the position of traveling auditor of the American Power & Light Company. This company is affiliated with the Electric Bond & Share group. It may be presumed that the work of Mr. Davis with this organization was all that the title of his position implied. In that event he certainly saw America first, for the properties are diversified and far flung. The states in which they are located are for the most part on the Pacific Coast with a sprinkling of them in the East. From that position Mr. Davis went to the Lehigh Valley Transit.

As Mr. Davis sees it the primary functions of the accounting department have been the preparation of financial data such as balance sheets and income accounts and the compilation of a financial history of the company. The accountant himself must be prepared to furnish all kinds of cost analyses both for operating and construction purposes, to compile regular reports and special data for regulatory commissions, and to handle numerous other requirements unheard of 25 years ago. To do this adequately Mr. Davis says the man in charge of accounting work should have the necessary technical education both as to accounting and finance, together with a fund of practical knowledge that can come only with experience. In one of the most complete articles on accounting practice which it has been the good fortune of the ELECTRIC RAILWAY JOURNAL to publish in recent years Mr. Davis set forth some of his ideas in "Accounting Practice," included in the series on modernization in the issue of this paper for Sept. 27.

Association News & Discussions

Tax Association Discusses Highway Finance

PAYMENT by the highway user of all maintenance costs and substantial share of the construction costs with interest was the chief conclusion in the report on "Problems of Highway Finance" submitted to the National Tax Association in its annual meeting held at Hotel Chase, St. Louis, Mo., on Sept. 18. Jacob Miner, professor of political economy at the University of Chicago, read the report.

If this program is carried out, it was held, all justification for charges that motor transportation is being subsidized in its competition with other transportation agencies will be removed. The report called attention to the fact that while the special taxes on motor vehicles amounted to only 5 per cent of the total highway expenditures in 1914, such taxes promise to be at least 45 per cent of the 1924 costs.

Because of the different stages of highway development reached by the various states and the many varying factors entering into such situations, the committee found it impossible to recommend any fixed formula for road taxation, saying that in all states except those at the very inception of the road improvement program, the taxation on vehicles should be sufficient to defray a substantial part of the construction and interest costs as well as all of the maintenance costs. The committee recommended a combination registration and gasoline tax as a simple and equitable method of placing the tax burden on vehicles using the highways.

In discussing this relationship between the stage of highway development and the method of financing construction and maintenance, the report said in part:

"During the initial period of construction of an extensive system of improved highways in densely populated and rapidly growing states, and states where the immediate need for the construction of improved highways is urgent, it would be unwise to attempt to finance highway construction wholly or even in large part from current tax revenues.

"If current revenues are relied upon in these circumstances there will result either an intolerable tax burden upon the community or else there will be an unreasonable retardation of highway improvement, entailing on the community the loss of many years of the advantage of improvement of highway communication.

"States and localities which, however, have already made considerable progress in highway construction and have already passed the peak of new annual mileage should move gradually toward the pay-as-you-use plan."

The members of the committee who prepared the report were: Jacob Miner, A. J. Brosseau, W. H. Maltbie, Thornton Alexander, W. G. Query, C. C. Converse and Maurice Groshon.

Safety Depends on Thinking*

By ISAIAH GORDON
Bureau of Safety, Chicago, Ill.

SAFETY advocates should avail themselves of every opportunity to address school children. Of course, admonitions given in such addresses may be quickly forgotten until the child is confronted with a hazard similar to that described in the talk. Then the admonition will come to mind, and it will be remembered that some one was injured or killed by failing to do the right thing.

I have in mind a case where a little boy was waiting for a long freight train to pull by, so that he could cross the tracks. While waiting another boy pushed him. He fell under the cars and his arm was cut off. I have used this in my talks, and said that it would be good judgment always to stand back one's full length from such danger. I dare say many will never think of this admonition until they come to a railroad track where a train is passing, but when they do they will remember and stand back.

Safety is a matter of thinking, thinking about everything we do. The reason why boys in school throw books, cut seats, walk over clothing with muddy shoes, instead of picking it up and hanging it on the hooks in the cloak-room, is because they have not been taught that such acts show lack of thinking. Teachers should appeal to school children to think and point out to them that destructiveness is unnecessary waste.

A plan which I believe will be beneficial to those who would like to start a safety organization in the schools calls for boys and girls to serve on various committees with a view to getting them to see the value of system, of thinking and of planning. For instance, a committee might be appointed to see that books and desks are not abused, a committee to see that coats and hats are properly taken care of, another to see that the stairways and corridors have no physical defects or hazards, one to see that automobiles and other vehicles observe the traffic rules in front of the school, etc. If we can get school children to think before they act in their school work we shall have gone a long way toward getting them to think outside of school, on the playground, in the street, and everywhere.

---

*Abstract of a paper presented before the thirteenth annual safety congress, Louisville, Ky., Oct. 2.

National Association of Railroad and Utilities Commissioners

THE annual meeting of the National Association of Railroad and Utilities Commissioners will be held Nov. 11-15 at Phoenix, Ariz. The official call for the convention is signed by Harry G. Taylor of Nebraska, president; William B. D. Ainey of Pennsylvania, a first vice-president, and James B. Walker of New York, secretary. There are now regulating commissions in 47 of the 48 states, Delaware being the only state without one. There are also such commissions in Hawaii, Porto Rico, Alaska and the Philippine Islands.

Traffic Association Proposed

CONNECTING electric railways in eastern Ohio, western Pennsylvania and the northern part of West Virginia have begun the organization of the Tri-State Electric Transportation Association. H. O. Allison, commercial manager Beaver Valley Traction Company, is the temporary chairman of this new organization, whose object is to develop passenger and freight traffic.

American Association News

Special Reports Available

THE following special reports have been prepared and are available to member companies in good standing upon request:

Electric Railway Valuations — Abstracts of recent valuations of electric railway properties officially approved by public utilities commissions or sustained by the courts. For each case there is given a summary of the physical values found together with a discussion of the allowances for overheads, intangibles, development costs, etc.

Anti-Jitney Regulation — Brief accounts of the principal developments in connection with attempts to secure the suppression or regulation of jitney competition with electric railways in the various cities in which the question has ever become an important local issue.

Suggested Remedies for Traffic Congestion — Abstracts of the principal traffic surveys which have been made in American cities with detailed summaries of the recommendations made. In each case a brief description of the traffic problem to be solved is given.

In addition to the above, supplements to the Fare Bulletin, Wage Bulletin and Cost of Living Studies have also been prepared, bringing them down to date.

M.-G. Locomotives for New Haven R.R.

New Type Engine Will Take 11,000-Volt Alternating Current from the Trolley and Convert It to 600-Volt Direct Current for Operating Traction Motors—Five Freight and Two Switching Locomotives Are Included in the Order

SEVEN single-phase locomotives of a new type have been ordered by the New York, New Haven & Hartford Railroad from the General Electric Company and the American Locomotive Company. Five of these units are for freight service and will be used on the main line between the Oak Point yards and New Haven. The other two are switching locomotives and will be used in general yard service. Whenever double heading, these locomotives will function in multiple-unit with the present single-phase locomotives.

The design of this type of locomotive is somewhat unusual in that although it is actuated from a single-phase trolley it does not have alternating-current traction motors. Each locomotive will contain a traveling substation and will be equipped with a synchronous motor-generator set for converting the 11,000-volt, 25-cycle, single-phase supply to direct current. Direct-current railway motors will be used to drive the axles.

Power will be collected from the overhead contact line by the usual slider pantograph trolley and delivered to a main transformer situated in the locomotive cab. This main transformer will step down the trolley potential to 2,300 volts. This 2,300-volt alternating current will drive a single-phase synchronous motor, direct connected to the main direct-current generator which delivers current to the traction motors. This generator is designed with a variable field so that the speed of the locomotive will be regulated by controlling the generator field current. The traction motors will be of the standard series direct-current railway type. They will be geared to the axle through cushion type gears which allow a small movement of the gear ring about the gear hub or center, thus minimizing shocks and stresses in the gears and pinions.

The freight locomotives will have a one-hour rating of 1,350 hp. at a speed of 20.4 m.p.h., while the switchers will have a one-hour rating of 500 hp. at a speed of 8.1 m.p.h.

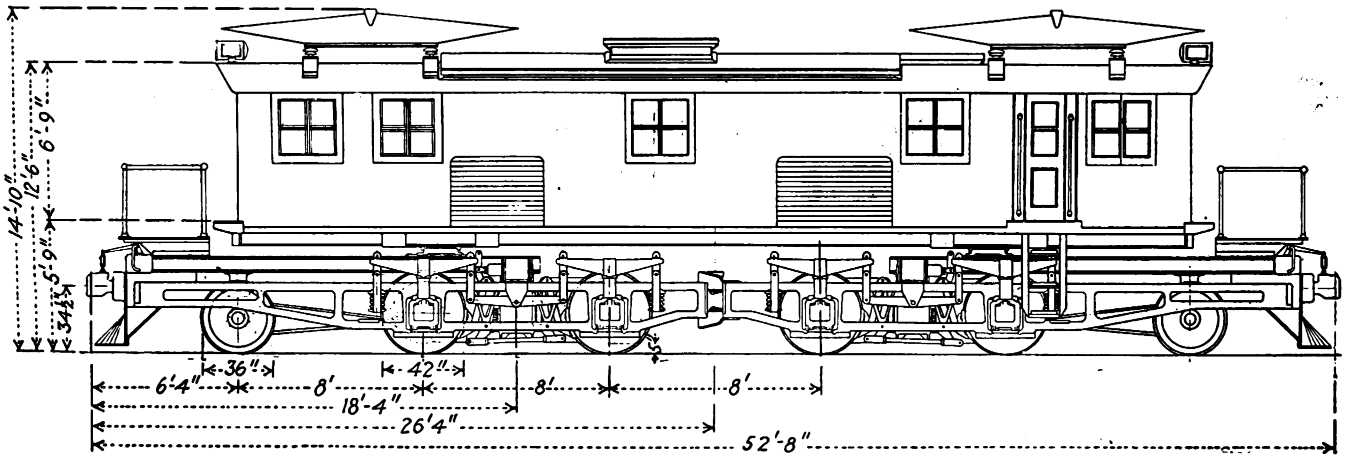
Between the pantograph trolley and the main transformer a time-limit automatic oil circuit breaker is installed. Between the direct-current generator and the traction motors there are a high-speed circuit breaker and line switches. The high-speed circuit breaker will afford protection to both the motors and the generator and will ordinarily prevent the opening of the time-limit switch or of the trolley or feeder sectionalizing switches.

The system of control, in which speed changes are obtained by varying the field strength of the generator, will make the locomotive speed characteristic extremely flexible and adaptable to all operating conditions. It also has the desirable feature of operating at a power factor of unity or of drawing leading current under all ranges of load, the motor-generator being designed with sufficient capacity not only to take care of the rated loads but to furnish an appreciable amount of wattless current, especially at light loads. This tends to improve the trolley voltage for all conditions of load and should be of material benefit in the operation of the entire system.

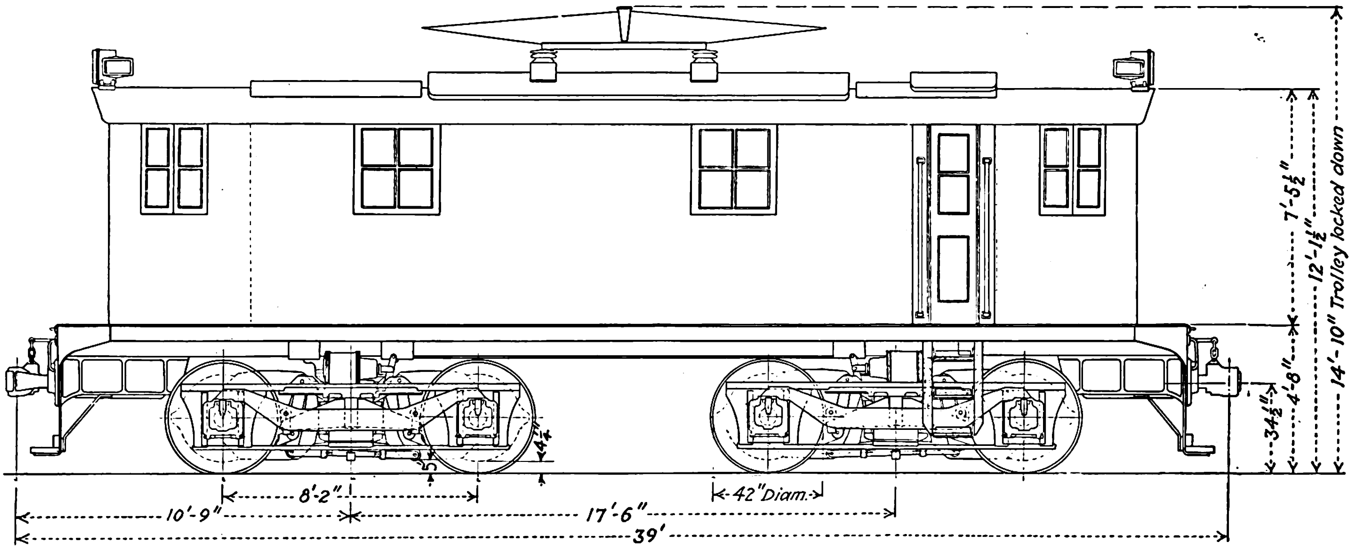
W. S. MURRAY MAKES STATEMENT

W. S. Murray, consulting engineer of New York, who was electrical engineer of the New Haven in the pioneer electrification, has issued a statement with regard to the purchase of this new type of locomotive. He says that he is greatly impressed with the wisdom, both on the part of the New Haven road to purchase, and the General Electric Company to manufacture, the seven electric locomotives of the type described. The history of power distribution shows that wherever power in bulk has had to be transmitted over considerable distances high-tension alternating current rather than the relatively low-pressure direct current has been the preferred agent, not only because less energy loss was involved but because a far greater flexibility of use was provided. It also has become equally well known that no alternating-current motor with variable speed characteristics can be as efficient or as cheap to purchase and maintain as the direct-current motor.

These new locomotives will receive high pressure



The Five Freight Locomotives for the New Haven Will Have Articulated Trucks and Geared Direct-Current Motors



Outline of Switching Type Locomotive for New Haven Railroad

11,000-volt alternating current from the trolley wires which will then be converted by a motor-generator—on board the locomotives—to direct current and fed to motors of that design geared to their driving axles. According to Mr. Murray we thus will see a marriage between economic transmission and distribution of electric power and economic utilization of electric power. The officiating "parson" in this marriage is the motor-generator. His fee is in the form of an annual retainer. Incidentally, what he charges will have everything to do with the economic success of this electrical wedlock. Certainly the General Electric and New Haven companies are both to be congratulated on their mutual confidence and acceptance of locomotives of the design described. In his opinion it will be the harbinger of a far-reaching result.

Double Folding Steps for High Platform Cars

A DOUBLE folding step arranged to operate in the same manner as the ordinary single type of folding step is being applied to the cars of the Altoona & Logan Valley Electric Railway. The type of step as shown in the accompanying illustration is the design of Carl E. Keefer, master mechanic. It provides for steps of 13 in. from the rail to the first step, 11 in. from the first to the second step, and 11 in. from the second step to the platform. This type has been installed on eight cars purchased from the Ohio Valley Electric Railway, which originally had a single step with a height of 16 in. from the rail and 19 in. from the step to the platform. The operating mechanism is the same as that used for single folding-step cars except that a connecting rod and two levers are added. The usual type of operating mechanism is attached to the lower step, and the upper step is operated through two bell-crank levers from the lower step.

The double step arrangement has a projection of 20 in. from the rail when opened, which is 3 in. greater than the original single step arrangement. The treads for the bottom step are 12 in. wide and the top step 10 in. When folded, they present an appearance of a single step, as the bottom tread is so arranged as to cover the top one completely.

Double Folding Step in Closed and Open Position

Detroit & Ironton Locomotives to Use M.-G. Control

The New Type Will Operate on a Single-Phase Trolley at 22,000 Volts and 25 Cycles—Design Has Been Made to Secure Great Flexibility of Speed Control in Heavy Freight Service—Complete Locomotive Will Develop 225,000 Lb. Starting Effort and 3,600 Continuous Horsepower

By Fred Allison H. L. Maher* and L. J. Hibbard†*

AN IMPORTANT development in the electrification of steam railroads is that recently announced for Henry Ford's Detroit & Ironton Railroad. While news of the electrification was published in ELECTRIC RAILWAY JOURNAL for Dec. 8, 1923, details of the electrification have not been available. As was to be expected, Mr. Ford has not been restricted by past practice or tendencies in the choice of electrical system and of type of motive power units for his road. The result has been the adoption of an overhead trolley line fed with alternating current at 22,000 volts, 25 cycles—a trolley voltage twice as high as any previously used in this country. The type of motive power unit adopted is not only novel in electrical design, but embodies many new and important ideas in the mechanical design. The locomotive shows possibility not only of containing but also of improving on all the desirable features of the most successful locomotives in use on present electrifications.

The mechanical parts for the new locomotives are being designed and built by the Ford Motor Company, while the electrical equipment is being designed and built to this company's specifications by the Westinghouse Electric & Manufacturing Company.

LOCOMOTIVES WILL WEIGH 340 TONS AND DEVELOP 5,000 HP.

The initial order calls for a locomotive comprising two motive-power units operated in multiple. It will develop a maximum of 5,000 hp. at 17 m.p.h. and will exert a maximum starting tractive effort of 225,000 lb. on the basis of a 42,500-lb. axle loading with 33⅓ per cent adhesion. The nominal rating of the locomotive will be 4,200 hp. It will also deliver 3,600 hp. continuously at all speeds between 17 m.p.h. and 25 m.p.h. and will exert 54,000 lb. tractive effort continuously when operating at 25 m.p.h. Each motive-power unit will be arranged for double-end operation so that an operating locomotive may consist of one, two or more units as desired. It is estimated that each unit will weigh 170 tons. All weight will be carried on the driving wheels.

MOTOR-GENERATOR CONTROL ADOPTED

The motive-power unit is of the motor-generator type. The principal reasons which have led to the adoption of this type can be summarized as follows:

While the use of alternating-current power supply for the trolley results in economy in distribution, direct-current traction motors of the most rugged type could be used. This gave the opportunity to design the motor for its own best condition, regardless of voltages, line surges, etc. In other words, the motors have the most rugged electrical characteristics and maximum efficiency. There also were possibilities for the simplification of the mechanical parts due to the high space and weight efficiency obtained in the traction motors. The direct-current motors permit simplicity and flexibility of control, as well as simplicity of the regenerative system and ability to regenerate at any speed from the maximum practically down to standstill.

Voltage control is used, with consequent freedom from rheostatic losses. This gives low accelerating peak loads, and ability to operate continuously at any desired speed. The speed characteristics obtained permit the locomotive to adapt itself to all changes in the profile, and the constant horsepower characteristic enables the locomotive to develop its full capacity under a variety of speed and tractive effort conditions.

The driving wheels have little tendency to start or continue slipping during accelerating periods, because the voltage impressed across each traction motor is low while the maximum starting tractive effort is being exerted, and does not increase if slipping starts.

There is inherent voltage regulating effect of the synchronous driving motor of the motor-generator set, with an attendant favorable effect on the distribution system. This makes it possible to maintain the a.c. power drawn by the locomotive at unity power factor and consequently tends to give low transmission losses.

The flexible control gives the locomotive the ability to operate at full load in the same train with any other type of alternating-current locomotive. It is able to operate as a constant-speed type of locomotive on all applications where this feature is desirable by separately exciting the traction motors. With this connection a large number of constant running speeds are obtainable when motoring.

LOCOMOTIVE EQUIPMENT

Each motive-power unit will be equipped with a transformer, a direct-current generator driven by a single-phase motor, eight axle-hung direct-current, series-type traction motors, and suitable control and auxiliary apparatus.

The single-phase alternating-current at 22,000 volts will be collected by means of a pantograph and conducted through an oil circuit-breaker to the primary side of the transformer, where it will be stepped down to a suitable voltage for driving the motor-generator set.

Direct current, which can be regulated from zero to 600 volts, will be delivered by the motor-generator set to the traction motors. These will be connected permanently in parallel. The locomotive is designed for regenerative braking.

---

*Ford Motor Company.
†Westinghouse Electric & Manufacturing Company.

The locomotive transformer will be 2,000-kva., two-circuit, oil-insulated, air-cooled railway type unit. The primary winding may be connected to receive either 22,000 or 11,000-volt power, while the secondary will deliver current at 1,250 volts. This will be accomplished by having the high-tension side connected between the circuit breaker and ground in series with two single-pole, double-throw knife switches. This feature has been included so that these locomotives can be operated over connecting 11,000-volt lines if desired at some future date.

The motor-generator set will consist of a 2,100-hp., 25-cycle, four-pole, single-phase motor, driving a 1,500-kw., 600-volt, 2,500-amp. generator at 750 r.p.m. on the same shaft. It will be self-contained, will be supported at three points and will have two bearings. A 75-kw., 125-volt direct-current main exciter will be mounted upon a shaft extension at the motor end of the set, while a 25-kw. direct-current "regenerative exciter" will be mounted upon a shaft extension at the other end.

The generator will have a series-excited differential field, an interpole field and a compensating field, as well as a separately excited main field.

The 75-kw. main exciter will supply excitation to the motor field, the generator field, the regenerative exciter field, and will supply power for the control circuits and for all auxiliary motors.

The 25-kw. regenerative exciter will be used to separately excite the traction motor fields during regeneration and during high-speed motoring periods.

GEARED D.C. TRACTION MOTORS EMPLOYED

The locomotive traction motors will be 225-hp., 600-volt, direct-current series, axle-hung machines. Each motor will be flexibly connected to the driving axle by a gear at each side. A 22-tooth, 3½-in. face, 3-diametral pitch pinion, suitable for meshing with a corresponding 98-tooth gear, will be mounted on a shaft extension at each end of the motor. The motors will be of a special mechanical construction for application to the mechanical parts being designed and built by Mr. Ford.

Each motive-power unit will be equipped with double-end control. Forty-five normal running speeds will be available between standstill and maximum speed during both the motoring and regenerating periods. When motoring the traction motors will be connected as series excited machines from standstill to 17 m.p.h., and as separately excited motors from 17 m.p.h. to maximum speed.

The traction motor fields are separately excited throughout the entire regenerative period. Regeneration may be obtained at any time while the traction motors are separately excited by regulating the generator voltage and traction motor field strength so that the motor voltage overbalances the generator voltage and causes the armature current to reverse. This will cause the traction motors to act as generators, driving the main generator as a motor, which in turn drives the a.c. motor, causing it to become a generator and return power to the line.

A closed-circuit type of transition will be utilized in going from the series excited to the separately excited connections of the traction motors and vice versa. Thus the separately-excited connections may be completed while the traction motors are energized and working at full load as series motors, without interrupting or appreciably changing the value of motoring tractive effort either during the changeover period or after the separately excited connections have been completed. This method of transition can be utilized advantageously when it is desired to increase the speed of the locomotive or to permit regeneration automatically.

Since the single-phase driving motor of the main motor-generator set, like the phase-converter of the single-phase three-phase locomotive, is not self-starting, the motor-generator set will be started and accelerated to approximately 50 per cent speed by means of the main generator and from 50 per cent speed to full speed by means of the a.c. motor. A 60-cell, 125-volt storage battery will be provided on each unit for this purpose. This battery also will be used for energizing the control circuits and supplying power to the compressor motor whenever the motor-generator set is shut down.

TYPICAL CYCLE OF OPERATION

Starting from rest with a full-tonnage train the traction motors will be energized as series-excited motors and the train may be accelerated with continuous full tractive effort up to a running speed of approximately 17 m.p.h. by manually regulating the main generator voltage through the external field resistor and a set of 50-amp., 125-volt switches. If load and grade conditions permit the use of a higher running speed than is obtainable with the series connection, the transition will be made from series to the separately excited connection of the traction motors. The speed may then be increased by weakening the field strength of the traction motors. This will be accomplished by manually regulating the regenerative excited voltage through an external field resistor and a set of 5-amp., 125-volt switches. Then when the train passes over the crest of a hill regeneration will take place automatically. The traction motors will act as generators, and if it is desired to maintain some constant speed while descending the grade, this can be done by strengthening and properly regulating their fields.

When the train is to be stopped heavier regenerative braking may be utilized if desired and a very low speed reached before applying the air brake.

The speed may be decreased to approximately 17 m.p.h. by properly regulating the traction motor field strength, and below 17 m.p.h. by regulating the generator voltage.

Statistics of Electric Interstate Carriers

THE bureau of statistics of the Interstate Commerce Commission has just published a report based on the returns of the electric railways reporting to that commission for the year ended Dec. 31, 1923. Altogether there are 271 companies, of which 186 are in the Eastern district, 7 in the Southern district and 78 in the Western district. The summarized statistics follow:

	Eastern District	Southern District	Western District	Total
Miles of road operated...	8,249 34	344.84	5,571.10	14,165.18
Freight revenue.........	$14,492,278	$2,018,094	$19,822,905	$36,783,277
Total operating revenues.	128,632,097	4,638,520	103,159,320	236,429,937
Total operating expenses.	101,983,442	3,183,868	81,436,497	186,603,807
Operating income...	29,191,469	4,378,851	21,687,710	55.258,030
Net income.............	4,335,111	2,208,826	7,041,958	13,585,895
Dividends declared.. ..	8,984,492	4,036	7,114,039	16,102,567

The News of the Industry

Service Started Over Dallas-Denton Line

The Dallas-Denton line of the Texas Interurban Railway, the electrified line of the Missouri-Kansas-Texas Railway of Texas, has been completed and regular service was started Oct. 1. Richard Meriwether, vice-president and general manager of this line as well as of the Dallas-Terrell line and of the Dallas Railway, reports traffic has come up to expectations and that operation of the line is in every way satisfactory.

The Dallas-Denton line of the Texas Interurban Railway is the second unit of the system of electric lines now being established in Texas by this company. The first was the Dallas-Terrell line. It is admitted by officials of the company that electrification of other steam lines radiating out of Dallas is being considered, and it is learned that the Missouri-Kansas-Texas line from Dallas to Greenville is one and the Gulf, Colorado & Santa Fe from Dallas to Cleburne is another.

Like the Dallas-Terrell line, which was the first line in the Southwest to use automatic electric substations and one-man cars, the Dallas-Denton line is operating one-man cars and depends on automatic substations for power. The same general plan of construction has been followed in the Dallas-Denton line as was followed on the Dallas-Terrell line, the only material difference being that a roadbed had to be constructed to Terrell and steel laid thereon, whereas from Dallas to Denton a steam line was electrified.

Although the tracks of the M-K-T were already built from Dallas to Denton, much new construction was necessary to make possible the operation of electric interurban cars. The electrification was carried out at a cost of $1,000,000.

Actual construction work on the Denton line was started March 15, 1924, and the line completed just six months and fifteen days later. For this construction work, the company organized to build the Dallas-Terrell line, known as the Texas Construction Company, was kept in existence. B. R. Brown was chief engineer, Sam R. Fowler, assistant engineer in charge of construction; M. B. Parsons, superintendent, and B. F. Cooke, electrical engineer in charge of electrical installations.

Some additional details of the project were published in the ELECTRIC RAILWAY JOURNAL of Jan. 12 and Jan. 26, 1924.

Plans for Detroit-Port Huron Bus Service

That hourly bus service will be started between Detroit and Port Huron, including towns on the river along the way, has been announced by the Detroit United Railway to begin late in October. The buses, it is stated, will be operated by the Wolverine Transit Company, a subsidiary of the D. U. R. At first the local buses will be operated in conjunction with the local interurban service, but it is believed that in a short time local electric service will be discontinued and entirely supplanted by buses on local schedules.

The local buses of the company will operate over Jefferson Avenue or a parallel street out of Detroit, and will follow the shore road into Mount Clemens. From Mount Clemens they will follow a route including New Baltimore, Fair Haven, Algonac, Roberts Landing, Marine City, St. Clair and Marvsville, with Port Huron as the northern terminal of the route.

The interurban tracks will not be abandoned, but will be kept in repair so that they can be used on the through runs and for handling freight and express.

Mayor Has Subway Measures

Chicago Officials Looking Into Proposals Made by Mr. Insull for Transit Construction with Private Funds—Surface Lines Say Rapid Transit Proposals Must Provide for Street Cars

SAMUEL INSULL, head of the elevated railroads, gas and electric utilities in Chicago, has offered to provide the city with increased rapid transit facilities to be financed entirely with funds raised privately. This is the first proposal of its kind, all similar offers made previously having contemplated the use to some degree of the borrowing capacity of the city. His proposal in this connection, however, had to do more particularly with the subway to be constructed through the down-town district, preferably under State Street and extending from Eighteenth Street on the south to North Avenue on the north with necessary connections with the present elevated lines at either end.

Mr. Insull says that this subway should have four tracks through the heart of the business district and double tracks at each end. His estimate of the cost of construction is between $25,000,000 and $30,000,000. Its construction would more than double the present rapid transit facilities through the loop by affording capacity for 2,400 cars an hour instead of 1,100 as at present. Mr. Insull believes, however, this subway should be owned by the city, but that it should be laid out so as to be capable of extension to the west, northwest and southwest sides.

WORK TO START IMMEDIATELY

Mr. Insull's proposal was made in a letter addressed to the Mayor and City Council on Sept. 27. It provides for starting work immediately on a comprehensive extension and improvement of rapid transit facilities in the city, including the subway through the congested downtown section to which reference has just been made. With the letter was submitted the draft of an ordinance outlining in detail the various extensions of facilities that are proposed. Acceptance of this ordinance would pave the way for an early start on the actual construction of extensions that have been under discussion for a number of years, and which would fit into the several schemes proposed from time to time for the development of a comprehensive transportation plan for the city.

The definite proposal contained in this letter, and the provisions of the ordinance which accompanied it, mark the culmination of the stand taken by Mr. Insull on the Chicago transportation situation in his address before the Cook County Bankers' Association on Feb. 21 of this year, reported in detail in the isssue of the ELECTRIC RAILWAY JOURNAL for March 1.

PROBLEM UP TO THE CITY

Coming as it does after a request for authority to make certain immediate improvements of the elevated structure including the extension of platforms for the accommodation of eight-car trains, for which funds are now available, this comprehensive plan for extending rapid transit service to make it available to the people of 45 out of the 50 wards in the city—this, together with acceptance of the task of financing such a plan—puts the responsibility for further delay squarely up to the Mayor and the City Council.

Up to this time the Mayor has consistently held to the principle that any action in the extension of transportation facilities in the city should fit into a comprehensive plan for the solution of the entire transportation situation in the city. He has also held that the difficulty of financing such a plan under private ownership made municipal ownership necessary.

With the submission of Mr. Insull's ordinance, the subway problem again became linked up with that of surface lines and the elevated. Mr. Insull's first offer to build a subway brought the statement from the surface lines officials that whatever plan was adopted taking into consideration the elevated lines also must make a provision for the street cars.

It was said that the purpose of the many ordinances was to find one that would fit the financial abilities of the city or of any private company which might undertake to build the subways. One of the suggestions is for an open-cut subway in the outlying section and tunnels downtown. Another is for a system of tubes connecting with surface, elevated and bus lines several blocks beyond the congested areas to the north and south. Still another ordinance provides a general system of short tubes radiating three ways from the heart of the city.

The engineering phases of subway construction will be dealt with in a report which the city's transportation engineer, Major R. F. Kelker, Jr., is drawing. He declares subway construction to be feasible and describes the engineering conditions in some parts of the city as ideal for the work.

Corporation Counsel Busch holds that construction outside the commercial districts could not legally be financed by any special assessment based on benefits. Financial experts declare that in no other way, either as a private or public undertaking, could funds be got.

Mr. Insull departed for Europe before Mayor Dever and his associates had progressed very far in their consideration of the proposals.

Wages Increased Two and a Half Cents in Boston

An increase of 2½ cents an hour was awarded to the trainmen and miscellaneous employees of the Boston Elevated Railway on Oct. 16 by the board of arbitration which had been considering counter proposals of employees and the company.

The award was signed by Judge John D. McLaughlin of the Superior Court, chairman and neutral member of the board, and James H. Vahey, counsel for the union men. Charles W. Mulcahy, company representative, dissented, submitting a minority report.

The employees had sought an increase of 25 cents an hour and the company had asked that the employees accept a reduction of 5 cents an hour. In commenting upon the proposal to decrease wages the majority ruled that disparity between income and expenditure is not a reason for reducing wages.

The decision of the board is final and binding to both company and union. It will continue in force to June 30, 1925, and is retroactive to July 1, last.

Experts for the company estimate that the award will add $500,000 yearly to the payroll, of which $175,000 will be in back wages.

By the terms of the decision the blue uniformed men, who comprise a majority of the employees, will receive a maximum of 72½ cents an hour. Operators of one-man cars and bus drivers were increased to 80½ cents an hour. This is the same differential that has been in effect for the last three years.

The company's representative declared that the increase was not justified, in view of current rates for wages, and asserted that the road had faced a substantial deficit in operation in the current year.

Indianapolis Freight Terminal Formally Opened

The new joint freight terminal constructed by the Interstate Public Service Company, Indianapolis & Cincinnati Traction Company, Terre Haute, Indianapolis & Eastern Traction Company and the Union Traction Company of Indiana was formally opened on Oct. 2. The terminal represents an investment of approximately $1,000,000. It was described in detail in the ELECTRIC RAILWAY JOURNAL of Aug. 2, 1924.

The occasion of the opening was celebrated by a dinner at which 400 guests were present. These included the traffic managers of practically every important industrial concern in Indianapolis, representatives of steam and electric railways located in the city and in the territory served by the four interested lines, and about 100 city and state officials. Neat souvenirs in the form of small scale maps of the electric lines in the C.E.R.A. territory, bound convenient for carrying in the pocket, were distributed. Frederick A. Doebler, president of the Traffic Club, presided. Harry Reid, president of the Interstate Public Service Company, was toastmaster. Among the speakers was John W. Colton, editor of *Aera* representing the American Electric Railway Association.

Another significant step was taken in connection with the completion and opening of this new terminal. Although the Central Electric Railway Traffic Association has been unable to agree on the establishment of a consolidated joint freight tariff, the four lines entering the new terminal have gone ahead with the preparation of such a tariff to apply between all stations on these lines and such other lines as may participate with them as issuing carriers. A committee consisting of Chairman F. D. Norveil, general freight and passenger agent of the Union Traction Company of Indiana; H. R. Biery, assistant to the president Indianapolis & Cincinnati Traction Company; J. H. Crall, general freight and passenger agent of the Terre Haute, Indianapolis & Eastern Traction Company and Bert Weedon, traffic manager of the Interstate Public Service Company, is carrying on this work.

All lines in the Central Association that desire to be shown as issuing carriers under this new consolidated tariff have been invited to participate, but in any event, the compilation of the tariff will be completed by the present committee, and rates to points on lines in the Central Association territory which do not care to participate, will be shown as a combination of the rates now in effect and those being compiled for the participating lines. In the preparation of this new consolidated tariff, it is the plan to use short-line steam railroad rates, wherever possible. It is being issued primarily as a "business getter," but is also expected to eliminate inequalities and discriminations.

North Shore Acts to Protect Its Operating Rights

A temporary injunction has been obtained by the North Shore Line restraining the city of Chicago from barring the trains of the Chicago, North Shore & Milwaukee Railroad from the tracks of the Chicago Rapid Transit Company (elevated railroads) within the city limits.

The court action was taken in answer to an order issued by the local transportation committee of the Chicago City Council, to the chief of police, to bar the North Shore Line trains, by force if necessary, on Oct. 13.

The hearing on the motion to make the injunction permanent will be held at a time fixed by the court following the answer to the action by the city.

The city contends that in order to operate its trains into the loop district the North Shore Line must obtain a franchise, as was outlined in a recent issue of the ELECTRIC RAILWAY JOURNAL.

The company contends that as long as it pays the Rapid Transit Company trackage rental for its trains together with a fee to the city for each car operated it does not need a franchise.

The drastic action on the part of the transportation committee was taken after a refusal on the part of its members to accept an offer of double the present fee paid by the company for each car, a total of $100 license fee per year.

The case is an interesting one from the standpoint of the questions involved. If necessary the company will carry the matter into a high court in order to settle the issue for all time.

Court Rejects Cleveland Arbitration Award

Judge Close in Common Pleas Court, late on Oct. 15, rendered a decision declaring illegal the arbitration proceeding of last June under which the Cleveland Railway platform employees were awarded a wage increase of 12 cents an hour. The court sustained the charge of fraud made in connection with the conduct of the arbitration.

In the same decision the court upheld the validity of the closed shop agreement that now exists between the railway and the local union. It directed that a new arbitration be held on the men's demand for higher pay.

The Cleveland Railway withdrew from the arbitration proceedings last June, on the ground that James W. Holcomb, the fifth and deciding member of the arbitration board, was biased and prejudiced in favor of the men.

Despite the withdrawal of the two representatives of the company from the arbitration proceeding Mr. Holcomb and the two arbitrators representing the union announced a decision giving the men a wage increase of 12 cents an hour.

The decision of the court denies the increase to the men. It is a victory for the company.

Unless the union attempts to carry the case to the higher courts, it is likely that members of a new arbitration board will be picked and hearings begun within the next few weeks.

Appeals Heard

Arguments For and Against Temporary Increase to P. R. T. Before Superior Court

Hearings on the appeal of the city of Philadelphia, Pa., and of other protesters against the recent order of the Public Service Commission granting a temporary increase in fares to the Philadelphia Rapid Transit Company were started on Oct. 9 and concluded Oct. 10, in the Superior Court. The seven judges who heard the case then took the matter under advisement.

At the opening session City Solicitor Gaffney said the commission's order was not justified, proof of which was that officials of the company had not adopted any definite plan relative to the time of buying more cars, and for building more crosstown lines. He said that the increase meant the collection from the car riders of an additional $300,000 a month. On the company's argument that a requirement to issue rebate slips would have caused too much trouble, and that rebate slips might fall into the hands of persons not entitled to collect them, Mr. Gaffney asked about expecting each of the 2,000,000 car riders to file his own complaint and bring his own suit to recover amounts overpaid as fares.

Frank M. Hunter, counsel for the Public Service Commission, was the last attorney to be heard by the court before adjournment for the day. He resented the implication that the commission had rendered its decision before the records of the fare hearings had been transcribed.

Frederick L. Ballard presented the argument for the Philadelphia Rapid Transit Company, at the hearing on Oct. 10, declaring that the old rates were confiscatory of the company's property. Under the former rates, this year there would have been a deficit of $2,500,000, Mr. Ballard said. He said that the company might have asserted a right earlier to charge rates high enough to prevent such deficit, but that it "did not like to change rates unnecessarily and had some reason to think that in time the old rates might yield what we are entitled to."

The Philadelphia Rapid Transit Company's report furnished as required by the order of the Public Service Commission shows for six days Sept. 25 to Sept. 30, at the new rate of fare $743,381 revenue against $740,387 a year ago, an increase of $2,994. The number of passengers carried was 13,633,349, against 15,477,540, a decrease of 1,844,191.

Milwaukee's Socialist Mayor Sees Bus as an Auxiliary

Mayor Hoan, Milwaukee, a socialist and former proponent of the use of the bus as a panacea for the city's alleged transportation ills, is convinced now that buses will never supplant street cars for mass transportation in large American cities. In an interview in the Milwaukee *Journal* for Oct. 7 the Mayor explained that he was convinced of this fact after studying the report of the local public utilities acquisition committee, to which reference has been made before in the ELECTRIC RAILWAY JOURNAL. In connection with that report the Mayor said that he had come to no conclusion regarding the advisability of the city entering into the proposed contract with the Milwaukee Electric Railway & Light Company. He said he had made only a cursory study of the commission's report, and wished to reserve judgment on it until after he had heard debates on both sides. On the subject of buses the Mayor was quoted as follows:

> I have come definitely to the conclusion that buses will never replace our traction lines.
>
> Prior to the time that the commission presented its report on the whole problem, I had leaned toward the belief that buses might possibly be an important factor in future transportation problems.
>
> The report goes thoroughly into this matter, however, and has convinced me that buses will be only supplementary to traction lines. Buses cannot be operated profitably for less than a 10-cent fare. The public demands a fare of from 5 to 7 cents. Transportion of this kind can be given, evidently, only by electric street cars.

Wage Increase in Dallas

The Dallas Railway, Dallas, Tex., has increased wages of trainmen in its employ 4 cents an hour effective from Oct. 1, 1924. The new wage scale in cents per hour will be as follows: First year, 45; second year, 48; third year and thereafter, 50. Wages of one-man car operators were increased 4 cents an hour.

In announcing the wage increase Richard Meriwether, vice-president and general manager, made public a resolution adopted by the board of directors. In part the resolution said:

> When wages were reduced on Aug. 1, 1921, the cost of living had materially declined since the peak of 1920, so that the management felt that, in view of the financial condition of the company and the reduced cost of living, a reduction in wages was justified. Since that time, however, there has been a material increase in the cost of living; and while the financial condition of the company is not by any means satisfactory, we feel that through effecting the greatest economy in operation and with the hearty co-operation and assistance of the trainmen's body, we will be able to bring about a reduction in operating costs which will permit of the increase.

Seeks Permit to Operate Bus Lines in New York City

The People's Electrobus Corporation, 44 Wall Street, New York, N. Y., headed by George W. Loft, wealthy candy manufacturer, has petitioned the Board of Estimate of New York City to operate 22 bus lines on 140 miles of streets at a 5-cent fare. A hearing will be held by the Board of Estimate on Oct. 22.

The offer is the fourth big petition that the city has received since the original plan was launched by the Omnibus Company of America. This concern, with John Hertz as chairman of the board, achieved a merger with the Fifth Avenue Coach Company.

In addition to the proposed Park Avenue route the company proposes to run five north and south lines and sixteen cross-town lines. The application states that the city would retain the right at any time upon six months' written notice after the first five years of operation to purchase the entire plant at a price fixed by three arbitrators.

Court Prohibits Truck from Competing with Interurban

The power of the Corporation Commission to regulate motor vehicles and to prevent them from operating in direct competition with Oklahoma interurbans was upheld Oct. 2 in the District Court of Pittsburg County. A permanent injunction was granted the Pittsburgh County Railway against C. E. Golden and W. L. Colvert, enjoining them from operating trucks along the highway paralleling the interurban line between McAlester and Hartshorne, Okla. Judge H. L. Melton ruled that the defendants were operating trucks contrary to the provisions of the state motor transportation law. The contention of the railway that the defendants failed to obtain permission to operate their trucks along the highway was upheld by the court. The State Supreme Court recently upheld the validity of the motor transportation act and ruled that the Corporation Commission had power to deny certificates of convenience and necessity to any bus owner, or company, where the public's interests seem to demand such action.

Providence Men Seek Wage Increase

Employees of the United Electric Railways, Providence, R. I., members of the Amalgamated Association, recently submitted the draft of a new wage and working agreement which calls for a general increase in wages amounting to 14 cents an hour. The draft contains 105 sections, most of them dealing with minor working conditions, many of them the same as are now in operation. The new wage demand for motormen and conductors on two-man cars is 70 cents for the first three months, 73 cents during the next nine months and 75 cents after one full year of service. The present wage is 56, 59, and 61 cents for the corresponding terms.

Operators of one-man cars who now receive 5 cents an hour in excess of the amount paid on two-man cars ask that the 5 cents be increased to 15 cents, or 90 cents an hour for men of more than a year's service. The same advance is asked for crews of snow plows and an additional 5 cents, or 20 cents an hour extra for the motorman. Bus drivers are rated as crews of two-man cars. The rate asked for motormen and conductors in the trolley freight department is 2 cents an hour more than is paid in the passenger service.

The agreement provides that no run shall be for less than seven hours nor more than eight. It provides that the company shall not prevent or discourage any employee from becoming a member of the union. In the matter of reducing or increasing the number of employees, the agreement stipulates that in case of reduction, the last man who was hired in the division to be reduced shall be the first to be laid off, and in the case of increasing the force, the last man laid off shall be the first to be given the chance to return.

The present agreement expires on Oct. 31.

Bus in Operation on East Side of Connecticut River

The Hartford & Springfield Street Railway has started a bus service on the east side of the Connecticut River between Hartford and Springfield, operating two buses regularly, leaving each city every two hours from 8 o'clock in the morning until 10 o'clock at night. A terminal has been established in Springfield, where a building is being remodeled for offices and waiting room.

The company has been operating a bus line on the west side of the river, between Springfield and Windsor Locks since last year. Recently it sought from the Springfield transportation board a license to run an east side service, on the ground that a faster service was necessary to enable the company to attract business and operate without loss. Springfield officials denied the application after informal hearings at which objections to the service were entered by President Clark V. Wood and General Manager H. M. Flanders of the Springfield Street Railway on the ground that such service was likely to cut into that company's receipts.

The interurban decided to start the service, however, on the ground that no permit from the Springfield authorities was needed as the buses would run express with no local stops in Massachusetts. In common with independent bus lines now doing an interstate business in that territory, the Hartford & Springfield Street Railway evidently rests its right to run on the assumption that such a service is under the jurisdiction of the federal authorities only.

Kansas City, Kan., Refuses Bus Permit

Judge Kimbrough Stone, of the federal court, under whom the receivers for the Kansas City Railway, Kansas City, Mo., are operating the property, and Col. F. W. Fleming, one of the receivers, have announced that they have invited experts to make a survey of the conditions in Kansas City to guide the court and the receivers so as to install bus service in co-ordination with car service. Announcement to this effect was made following the return of officers of the company who were in attendance at the American Electric Railway Association convention in Atlantic City. Judge Stone will announce his orders in the matter in November.

Meanwhile the City Commissioners of Kansas City, Kan., on Oct. 13, refused a franchise to the H. H. Moore Company, Cleveland, which had organized the Kansas Cities Motor Coach Company, buying the bus line already operated by P. H. Kennedy. The new company is operating four or more Fageol buses in intercity service, and six or more street car type buses in cross-town service, one route, within Kansas City, Kan., 10 cent fare, giving transfers. The routes will be increased; but none will go over street car streets. The Moore company recently sold its Cleveland-Akron bus line, operating 40 buses, to the Northern Ohio Traction & Light Company. The Moore company, the holding company, and Mr. Moore, are large operators of passenger and freight interurban and touring service.

East St. Louis Company Wants Bus Line for Connection

The East St. Louis Railway, East St. Louis, Ill., applied to the St. Louis Board of Public Service Oct. 7 for a permit to operate buses over the St. Louis Municipal Bridge in East St. Louis and to loop around certain streets in St. Louis. The Board of Public Service will set a date for a public hearing on the application. Recently the Community Motorbus Company of Belleville, Ill., applied for a similar permit, but failed to appear when a public hearing was held. That permit has not been granted.

The East St. Louis Railway is now operating buses in conjunction with its railway in East St. Louis. Connected up with its present bus line on Twenty-fifth Street between Missouri Avenue and Lincoln Avenue, in Lansdowne, the proposed bus line over the free bridge would give East St. Louis a short and direct connection between its outlying residential districts and downtown St. Louis and take much traffic from the congested Collinsville Avenue district in East St. Louis.

Sixty-Day Bus Permit for New York

Mayor John F. Hylan and other members of the Board of Estimate of New York agreed on Oct. 10 to grant a sixty days' revocable franchise to the Fifth Avenue Coach Company to operate buses in the Bronx at 10 cents.

Operation was begun the following morning on a four-minute headway. The buses run from 138th Street and Mott Avenue to the Grand Concourse, and through the Grand Concourse to Mosholu Parkway with a spur to the Hub, which is at 149th Street and Third Avenue.

Henry Bruckner, Borough President of the Bronx, forced the issue by calling the attention of the Mayor and other members of the board to the fact that conditions on the Grand Concourse had reached a pass that demanded immediate relief. Oct. 22 is the date set for a general hearing and discussion of the bus question, but Mr. Bruckner demanded immediate action for the Bronx.

Frederick C. Wood, president of the Fifth Avenue Coach Company, said his company could start its lines operating in the Bronx at once if he were given a temporary sixty days' permit.

The same question was asked Edward A. Maher, Jr., counsel for the Third Avenue Railway System, which has had a Bronx bus application pending for three years. Mr. Maher said he could start buses in two weeks, but would have to acquire them.

It was pointed out, however, that this grant by the board in no way binds it or the Mayor in acting upon future applications for franchises and that the permit granted is revocable, without prejudice to the Mayor and his maximum 5-cent fare principle, at the end of sixty days.

Wages Reduced Under Three-Year Canadian Agreement

Trainmen in Vancouver and Victoria, B. C., have signed a new agreement for three years with the British Columbia Electric Railway.

No change takes place in the wages of motormen and conductors. They now receive 62 cents an hour on two-man cars in city service and 68 cents an hour for one-man cars. Wages of trackmen and car cleaners will be reduced 3 cents an hour to 53 cents for city trackmen, 48½ cents for interurban trackmen and 51 cents for car cleaners.

In Victoria the system is operated entirely with one-man cars. There the wages of operators will be reduced 4 cents an hour from 68 cents to 64 cents, due to the lower rents, reduced cost of living and the condition of the railway.

The new agreement was made with the street railway union. It dates from Sept. 1. Brief mention of the wage changes was made in the issue of this paper for Oct. 11, page 667.

New Jersey Fare Suit Dismissed

The United States Supreme Court on Oct. 6 dismissed the suit of the Board of Public Utility Commissioners of New Jersey to compel the Public Service Railway to reduce its fares to 7 cents, with a 2-cent transfer charge. The court was advised that the parties to the suit had reached an agreement.

This action by the commission in bringing suit was one of the moves made in connection with the rate and valuation controversies which culminated in the suspension of service by the company in the summer of 1923 for a period of more than a month. Growing out of the negotiations conducted at that time the company put in for a trial period of four months beginning Oct. 1 a rate schedule which provided a 5-cent fare within the limits of the larger cities, with an additional 5-cent fare in the suburbs, but no transfers. The rate of 8 cents, with four tokens for 30 cents, and 1 cent for a transfer, was continued in all other parts of the territory. This is the general arrangement now in effect.

Steam and Electric Properties Contend Over Business

A hearing was held recently before Examiner A. C. Wilkins of the Interstate Commerce Commission on the question of cancelling the right of the Salt Lake & Utah Railroad, Salt Lake City, Utah, known as the Orem Electric, to participate as a carrier in westbound transcontinental traffic. Thirty days were granted to each side to file its brief, the Salt Lake & Utah Railroad appearing as complainant against the cancellation and the Union Pacific as the respondent.

It was the contention of the electric line that to cancel its right to this business would be discrimination against it. It set forth that it had enjoyed this tariff for five years and that the tariff had increased its revenue materially. The Union Pacific alleged that the shorter line acted as a "bridge" carrier, hindered prompt movement and was unnecessary.

Fourteenth Street Subway Plans Advanced

The Board of Estimate of New York City on Oct. 10 adopted unanimously the plan of the Board of Transportation for the completion of the Fourteenth Street-Eastern District subway line by the use of a 700-ft. elevated structure connecting the tube with the elevated lines of the Brooklyn-Manhattan Corporation at East New York. This apparently removes the last official obstacle to the completion of a long delayed part of the city's rapid transit system.

At the same time the Board of Transportation opened bids for the construction of that part of the new subway extending along McKibben Street and Harrison Place from Boerum Street to Varick Avenue, Brooklyn, a distance of 3,600 ft. Of the six bids, the lowest was that of the Marcus Contracting Company for $2,561,000.

The section of the subway on which the contractors bid on Oct. 10 is one of three subdivisions of that section of the Fourteenth Street-Eastern line. The construction of the two other sections will be bid for on Oct. 17.

The completed part of the Fourteenth Street-Eastern District route, extending under the river from Sixth Avenue, New York, to Bushwick Avenue at McKibben Street, is now in operation is a shuttle line.

Seven Cents Allowed.—The Public Service Commission has approved a rate for the new line of the Syracuse Railway Co-ordinated Bus Line, Inc., known as Strathmore Bus Line, operated in the city of Syracuse, N. Y., of 7 cents per capita, or a valid transfer issued by the New York State Railways (Syracuse Lines). Children under six years of age, when accompanied by parent or guardian, will be carried free. Fare for children between the ages of six and ten years will be 4 cents.

Honor for Railway Official — H. Hobart Porter, president of the American Waterworks & Electric Company and of the Brooklyn City Railroad, has been elected to the board of trustees of Columbia University. Mr. Porter is a member of the firm of Sanderson & Porter. He has been connected with the Brooklyn City Railroad since 1919, when upon the separation of the Brooklyn City lines from the old Brooklyn Rapid Transit Company he became general manager.

Transfer Restrictions Lifted. — A more liberal use of car transfers was recently announced by the Des Moines City Railway, Des Moines, Ia., in connection with the concession to grant the company an 8-cent fare. Permission has now been given for transferring from one line to another even though the lines run along parallel streets. In the future transfers will be accepted at other than the transfer points provided they are used within the time limit. Restrictions on various lines have been lifted.

Chair Car Service Made Permanent.—Effective on Oct. 16, the Detroit, Monroe & Toledo Short Line Railway, Detroit, Mich., began operating a new and improved limited service between Toledo and Detroit. Limited trains are scheduled hourly now and express cars are canceled. Alternate trains will be de luxe chair cars. L. M. Swartz, district passenger agent, says the plan will give much faster service for the through traffic which is rapidly becoming the most important part of the passenger business. Service with the chair cars proved very popular after a short trial of them.

New Transfer System in Effect.—The Springfield Street Railway, Springfield, Mass., has put in force a transfer system similar to that already in use in Worcester. The transfers are of different colors, representing different lines, and the system hinges on the principle that the transfers, instead of being punched to indicate the lines the passenger can take, are marked in advance to show the lines he cannot take. This affords passengers considerable leeway as to cars, but it saves time on the part of conductors and operators. The time limit for which a transfer is good has been extended 10 minutes under the new plan.

Restores Free Transfers.—The Philadelphia Rapid Transit Company, Philadelphia, Pa., recently announced the restoration of free transfers at Seventeenth, Eighteenth, Nineteenth and Twentieth Streets, to and from Market Street. It was explained that the motive in the abolition of the transfers at the points where they have been restored was a desire to try to avoid congestion in the central delivery district by keeping riders from boarding Market Street cars to go only a block or so. It has now been decided that the congestion does not extend west of Sixteenth Street. In consequence it was decided to restore the free transfers.

Electric Railway, Trunk Lines and Tube in Terminal Project.—Plans have been submitted to Director of Public Works Raymond at Newark, N. J., for a combined terminus for the Pennsylvania Railroad, the Hudson & Manhattan Railroad and lines of the Public Service Railway on the site of the present Market Street station. The new structure will cost $15,000,000 and will eliminate Manhattan Transfer. Passengers to and from lower New York City now change from Hudson & Manhattan Railroad trains to Pennsylvania trains and vice versa at Manhattan Transfer. Upon its completion, it is said that all except the purely local cars of the Public Service Railway will be diverted from the present Public Service Terminal to the new building.

Argues Against Bus Substitution.—Abandonment of the suburban line between Absecon and Somers Point, N. J., and the substitution of buses would mean the scrapping of the Atlantic City & Suburban Railway, Atlantic City, N. J. So the superintendent told the Board of Public Utility Commissioners at a recent hearing on the application for increased rates. The suggestion that buses be substituted was made by Colonel Philander Betts, chief engineer of the Public Utility Commission, who declared the operation of the rival tracks was neither economical nor useful and that there was no justification for a fare increase. The hearing will be continued.

One-Man Cars with Two Men.—The Key System Transit Company, Oakland, Cal., has been granted permission by the Berkeley City Council to operate one-man cars on the Ashby Avenue and Dwight Way lines in the college city by using two-man crews. The one-man cars for these two lines were given a tryout in the spring. The City Council at that time expressed the opinion that, due to the many crossing over rapid transit lines, one man could not safely operate the cars and ordered the cars taken off. The new cars were replaced by others with two-man crews, but residents of the district requested a better type of car. The company then offered to place the one-man cars back in service, using two men on each car. After investigating the subject, the Council consented to this offer.

Ordinance to Continue Line Passed.—The plan whereby the Toledo, Fostoria & Findlay Railroad, Fostoria, Ohio, will operate the Tiffin & Fostoria line is expected to pass the Council at Fostoria on third reading set for Oct. 21. The franchise has been drawn up to settle difficulties encountered by the Tiffin & Fostoria line in Fostoria. The city demanded pavement of streets and removal of freight sheds. The company threatened to junk the property. In the new franchise sale of the property except to former owners is provided, tentative paving specifications are approved by the city, and a clause is included for removal of freight sheds by July 1, 1925.

Through Service Re-established. — Through car service between Springfield and Northampton, Mass., has been reestablished after an interruption of several years. This action followed a successful week's experiment during the Eastern States Exposition. A regular schedule for the through cars, operated as a joint service of the Springfield, Holyoke and Northampton systems, became effective on Sept. 22. This service is in addition to the limited service between Springfield and Holyoke. The fare from Springfield to Northampton is 64 cents.

Fare Dodgers Punished.—Members of the secret service staff of the International Railway, Buffalo, have brought about the arrest of passengers alleged to be exchanging transfers at line intersections to avoid the payment of cash fares. Several passengers have been found guilty and nominal fines of $5 each imposed.

Belt Line Contract Signed.—Contracts for the operation of the Tacoma Municipal Street Railway, Tacoma, Wash., as a tideflat belt line have been signed by three of the four transcontinental railroads serving Tacoma. It is expected the city line will begin operating as a belt line by Nov. 1. The operation as a belt line will save Tacoma industries of the tideflats a switching charge they now pay on noncompetitive line business, and will also give a lower intraterminal switching charge.

Financial and Corporate

Protective Committee Reports Progress

Letter to Bondholders of the Hamilton Property Reviews Conditions Since Receivership

A protective committee recently sent a letter to the holders of the first consolidated mortgage 5 per cent bonds of the Southern Ohio Traction Company, Hamilton, Ohio, sketching the progress which has been made since George P. Sohngen took possession of the property as receiver on Nov. 6, 1920. The road then was in very poor physical condition, struggling to give service with inadequate facilities.

As a result of the progressive improvements made at the suggestion of the committee's experts, the physical condition of the property has been materially improved; the deficiency in tie renewals has been largely made up and a large amount of work has been done in reconstructing and rehabilitating track in paved streets. Extensive repairs were made to ten passenger cars, two freight cars and four work cars used in interurban service and two cars used in the local city service in Dayton. Despite these repairs, the present interurban equipment is uneconomical and unsatisfactory in service and should be replaced, the statement says, by more modern and attractive rolling stock.

BUS COMPETITION OVERCOME

On the matter of bus competition, the committee reports that beginning in November, 1920, competition developed in Hamilton, Ohio, and as a result traffic on the Hamilton city lines was reduced more than 30 per cent within a period of six months. Heavy operating deficits made imperative either the abandonment of these lines or their modernization. Accordingly receiver's certificates and car trust certificates were issued to finance the purchase of 22 one-man safety cars to be used on the Hamilton city lines. Introduction of safety cars in April, 1922, coupled with the provision of more frequent service and the rehabilitation of the local city traffic, has radically changed the financial results of operation of this section of the property. The introduction of this equipment, together with track rehabilitation, marked the beginning of the end of bus competition, which shortly thereafter was stamped out on all except one line.

In February, 1922, competitive bus routes paralleling the interurban lines between Cincinnati and Hamilton were started. This competition has since continued and in consequence the revenues and traffic on this section of the interurban line have been greatly reduced. Bus competition developed along the interurban line between Hamilton and Dayton in June, 1922, but before June 11, 1924, all of the bus competitors were forced to discontinue service.

The report refers to the value of the Freeman-Collister act regulating buses, to the rejection of the application of the Royal Green Coach Company, and the value of the decision of the Supreme Court to the property covered by the holders' mortgage.

In concluding, the report states that although it is impossible in advance of the final accounting of the receiver, ordered by the Ohio Supreme Court to determine the net earnings accruing to the trustees under each of the several mortgages now in default, yet it seemed clear from the receiver's reports that during recent months the entire net earnings of the property, over and above operating expenses, resulted from the operation of the interurban line between Hamilton and Dayton and from the operation of the Hamilton city lines. According to the current reports of the receiver during the first five months of 1924, the net earnings after operating expenses, maintenance and taxes of the interurban line between Hamilton and Dayton and the local city line in Dayton aggregated $69,523. Assuming that the receiver sets up for those months the same depreciation accrued by him during a like period in 1923, the depreciation accrual applicable to that section of the property would aggregate $25,665, leaving a balance available for rentals, interest, etc., during the five months of $43,858.

The committee is confident that the advantages in a reorganization of the property as a unified system are so self-evident that all parties in interest will work to effect that result. The committee believes that depositors will be well advised not to sell their holdings of Southern Ohio bonds at a great sacrifice. Further, the committee points out that while there has been a marked improvement in the physical condition of the property, a large amount of rehabilitation work is required on the section of the interurban line between Cincinnati and Hamilton. In the judgment of the committee's experts the carrying out of this work should result in a substantial increase in the volume of through business between Cincinnati and Dayton and should cripple, if not destroy, the existing bus competition. Further, that substantial expenditures should also be made upon the interurban line between Dayton and Hamilton in order to permit of a speeding up of schedules, which should result in a further increase in business. New passenger equipment should be provided for the interurban line, while substantial additions should be made to the present freight equipment.

All this work, in the opinion of the committee, makes necessary the provision of a substantial amount of new capital, a large part of which must be provided in connection with the reorganization of the property.

Middle West Utilities Company Completes Financing

The Middle West Utilities Company, Chicago, has deposited with the Illinois Merchants Trust Company of Chicago, Ill., $6,246,500 to pay off at par and accrued interest all of its ten-year 6 per cent bonds maturing Jan. 1, 1925. Payment of these bonds leaves the company with no maturing obligations before Sept. 1, 1935. Series "A" notes, of which $2,340,000 were issued, mature at that time. These notes are redeemable at the company's option subsequent to Sept. 1, 1925. Series "B" notes, of which $2,195,500 were issued, mature Dec. 1, 1940, and are redeemable subsequent to Dec. 1, 1925. Series "C" notes, of which $1,309,000 were issued, mature July 1, 1941, and are redeemable subsequent to July 1, 1926. After the payment of the ten-year 6 per cent bonds on Jan. 1, these notes, totaling $5,844,500, will be the only outstanding senior obligations of the company.

Following almost immediately upon this announcement a syndicate composed of Pynchon & Company, West & Company and the Middle West Utilities Corporation offered an issue of 20,000 shares of Middle West Utilities Company 7 per cent prior lien stock at $98 and accrued dividend to yield about 7.14 per cent. The prior lien stock is participating in that it is entitled to an additional 1 per cent dividend in any calendar year in which the total cash dividends paid on the common stock exceed $5 a share.

Among the many subsidiaries of the company is the Interstate Public Service Company, which operates 90 miles of electric railway. This is, perhaps, the most important of the company's railway holdings.

Columbus Stockholders Who Sold Are Paid

The control of the Columbus Railway, Power & Light Company, Columbus, Ohio, formally passed into the hands of Cyrus S. Eaton, Cleveland, on Oct. 14 when stockholders residing in Columbus and vicinity received approximately $3,000,000 for shares they had turned over to Mr. Eaton. Mr. Eaton originally offered to buy 46,000 shares, which he finally obtained. Checks in payment of the entire transaction amounted to more than $5,000,000. Payment was made at the rate of $115 per share, plus accumulated dividends from Sept. 1, minus 2 cents per share for transfer tax.

Immediately after gaining control, Mr. Eaton announced the merging of the Columbus Railway, Light & Power Company with four other utility organizations in a super-power company under the name of the United-Continental Gas & Electric Company, which covers territory in the Middle West and Northwest.

Work is now to be pushed as fast as possible on the new 150,000-kw. station of the Columbus Railway, Power & Light Company located about 10 miles south of Columbus. The completion of the plant will make Columbus a power center in the merger.

Seven Per Cent Issue Replaced by Lower Coupon at Minneapolis

Dillon, Read & Company, New York, announced on Oct. 16 by public advertisement that they had sold an issue of $5,000,000 of first mortgage collateral 5½ per cent gold notes of the Minneapolis Street Railway, Minneapolis, Minn., dated Nov. 1, 1924, and due Aug. 15, 1928. The offering price was 100 and interest. Principal and interest on the loan are unconditionally guaranteed by the Twin City Rapid Transit Company. The transaction is purely a refunding one, carried out in accordance with the tendency under present conditions of easy money to replace high coupon issues with ones bearing lower interest wherever the transaction can be carried out to advantage. In the present case it is explained that "as these notes bear 5½ per cent interest and replace a 7 per cent issue for a like face amount, their issue will result in a material saving of interest to the company.

Stock Rights Accrue to New Jersey Holders

The Public Service Corporation of New Jersey is offering to holders of common and preferred stock of record Oct. 17, additional common stock in the ratio of one share of no-par value common for every ten shares of both common and preferred. The price is $60 a share, plus accrued dividends. Subscription will be due Dec. 1, and accrued dividends up to that date will amount to 66⅔ cents a share. Subscribers will have the option of paying $30 a share cash on Dec. 1, $15 on Jan. 2, 1925, and $15 additional on April 1, 1925. It is estimated that the amount of the new issue will be between 100,000 and 120,000 shares.

Motion Made to Consolidate St. Louis Foreclosure Suits

A motion to consolidate the receivership and foreclosure suits pending in the United States District Court against the United Railways, St. Louis, and some of its subsidiaries, was filed by counsel for the Mercantile Trust Company, trustee under the indenture securing the general mortgage bonds of the St. Louis Transit Company. The Transit bondholders have filed foreclosure proceedings as a step toward complete reorganization of the company. A hearing on the new motion will be held by the court on Oct. 25.

Holders of the bonds of the St. Louis & Suburban Railway to date have declined to accept the plans for reorganization in so far as they affect the Suburban general bonds, but it is believed in financial circles in St. Louis that this difficulty will be surmounted and that the reorganization plans will be carried through probably unchanged.

Suspension Time Extended.—The petition of the Virginia Railway & Power Company for permission to discontinue service over the Pinner's Point line and the Park View and Cemetery line in Portsmouth, Va., is before the State Corporation Commission. The case was heard on June 19 and the commission entered an order granting suspension of service as of Sept. 15, but on Sept. 12 another order was entered extending the suspension indefinitely so as to permit the taking of further evidence.

Manhattan Rental Payment Declared.—The directors of the Interborough Rapid Transit Company, New York, have declared a regular quarterly rent instalment of $1.25 a share on the stock of the Manhattan Railway, payable on Nov. 1 to holders of record of Oct. 20. This is in accordance with the readjusted rental plan which provides dividends at the rate of 5 per cent per annum beginning with the fiscal year starting July 1, 1924.

Hearing on Abandonment Deferred.—At the request of the corporation counsel of Auburn, N. Y., and attorneys for the Auburn & Syracuse Electric Railroad hearing by the Public Service Commission in the matter of the abandonment of the Clark Street and Aurelius Avenue portion of the railroad's line in Auburn will be postponed to a later date. The hearing has been advertised for Oct. 17 at Auburn. The case will be called at that time and then adjourned to a date to be fixed later.

Loss for Fiscal Year.—The Sault Ste. Marie Traction Company, Sault Ste. Marie, Mich., lost $1,030 in the year ended June 30, 1924. After deducting $16 for interest received on bank account and adding $4,057 for depreciation on buildings and equipment, the company lost $5,070 which was added to the debit balance of $28,466 brought forward from the previous year. This left a total debit balance carried forward of $33,436.

Will Dismantle Line.—The Menominee & Marinette Light & Traction Company, operating in Marinette, Wis., and Menominee, Mich., has decided to dismantle its Quimby Avenue line in Menominee. The company claimed that the line cost $11,000 annually to operate and that the revenue was only $5,000. Admission was made by the franchise committee of the Menominee Council that it was powerless to prevent this action because the company operates without a franchise.

Time for Deposit Extended.—The reorganization committee of the New York Railways, under the plan and agreement of July 18, 1924, has extended the time for the deposit of bonds and stocks listed in prior notices published by the committee until the close of business Oct. 20. Penalties may be imposed after that date. The plan and agreement for the reorganization of the road have been approved, the sale at foreclosure has been conducted and only a few minor details now remain to be arranged. The company operates about 70 miles of surface lines, mostly in the Borough of Manhattan. Extended references were made to the terms of the reorganization proposal in the ELECTRIC RAILWAY JOURNAL for July 12, page 67, and Aug. 2, page 183.

Bonds Called for Redemption.—All of the outstanding general and refunding mortgage 7½ per cent gold bonds, series A, of the Puget Sound Power & Light Company, Seattle, Wash., dated May 2, 1921, and due May 1, 1944, have been called for redemption Nov. 1 at 105 and interest. Bondholders may present their bonds at any time prior to Nov. 1, 1924, and receive for each $1,000 bond $1,087.50, less a discount at the rate of 3½ per cent for the period from the date of their presentation to Nov. 1, 1924.

Trains Will Replace Trolleys.—The Public Utilities Commission has granted the petition of the Connecticut Company requesting permission to discontinue operation of trolleys over the tracks of the New York, New Haven & Hartford Railroad, between East Hartford and Rockville. Public convenience and necessity do not warrant the further continuance of the service, and the service is now being operated at a loss, the commission finds. The New Haven road has offered to increase the frequency of its steam railroad service between Hartford and Rockville to six trains each day on the discontinuance of the electric service over its tracks. The commission's order and the road's new service will affect the towns of East Hartford, Manchester, Vernon and Rockville.

Hears Petition to Buy Common Stock.—A hearing on the petition of the Interstate Public Service Company, Indianapolis, Ind., for authority to buy the common stock of the Indiana Power Company and of the Knox & Sullivan County Light & Power Company from the Utilities Power & Light Company was held before the Indiana Public Service Commission recently. The petitions were not contested. The Interstate Public Service Company is on Insull operating company and the Utilities Power & Light Company is an independent corporation, of which H. L. Clarke of Chicago is president. It is owned by Clarke and his associates. The two subsidiary companies involved in the transaction serve about thirty towns and communities in southwestern Indiana.

Short Line Suspended.—The Berwick & Nescopeck Railway, Berwick, Pa., after operating for twelve years, discontinued trolley service at midnight, Oct. 5. The company has replaced the cars with buses and service is to be continued on the usual schedule. The line is 1.6 miles long.

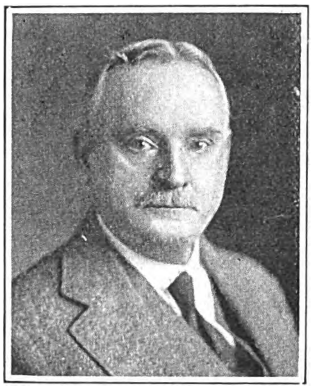
Second Mortgage Issue Sought by D. U. R.—Attorneys for the Detroit United Railway appeared before the State Public Utilities Commission at Lansing, Mich., on Oct. 14, to request that the company be authorized to sell $2,000,000, par value, of second mortgage bonds at 75 cents on the dollar. They said the company wished to improve its electric lines and purchase several bus lines.

Deficit of Interborough in August Larger.—The Interborough Rapid Transit Company, New York, reports for August a net operating revenue of $1,011,110, an increase of $240,098 over the similar month last year, but a deficit after revenues and rentals of $519,282, an increase of $174,283 over that reported a year ago.

Personal Items

Edwin W. Robertson Leaves Columbia Utilities

With the idea of curtailing his labors, Edwin Wales Robertson, formerly chairman of the board of directors and treasurer of the Columbia Railway, Gas & Electric Company, Columbia, S. C., and the Parr Shoals Power Company and president of the Columbia Gas Light Company, has severed his connection with the public utility business in that community. Having arrived at the age of 61 years, Mr. Robertson wants to be relieved of some of his efforts, and has therefore disposed of his controlling interest in these several properties. The sale was satisfactorily and amicably carried into effect with the General Gas & Electric Company, under the leadership of W. S. Barstow of New York.



Edwin W. Robertson

It was in 1903 that Mr. Robertson obtained control of the Columbia Electric Street Railway, Light & Power Company, and the name was subsequently changed to the Columbia Railway, Gas & Electric Company. In 1905 he purchased the entire assets of the Columbia Water Power Company and the Columbia Gas Light Company. In 1912 he financed and arranged to build the Parr Shoals Power Company hydro-electric plant.

Mr. Robertson was born in Columbia on Sept. 3, 1863. In 1885 he was graduated from Yale University and from the law department of the University of South Carolina in 1887. Mr. Robertson has been very conspicuous in the banking field, establishing the Canal Dime Savings Bank of Columbia, and in 1897 acquiring control of the Loan & Exchange Bank of Columbia. Later he merged the two banks. In 1905 he was elected director in the Equitable Life Assurance Society of the United States. He has been a member of the Executive Council of the American Bankers' Association and president of the State Bankers' Association, and is a member of the Graduate Advisory Board of Yale University.

At the outbreak of the war he took an active part in the various Liberty loans, being chairman of the loan committee for the state of South Carolina in the first four war loans.

J. W. Spencer, for the past two years district superintendent of the Anniston operations of the Alabama Power Company, has been transferred to the records department of the company, with headquarters in Birmingham. C. J. Perryman, superintendent of the Gadsden operations of the company for many years, will succeed Mr. Spencer at Anniston.

C. B. King, manager of the London Street Railway, London, Ont., since 1905, has resigned. It is stated that L. Tait, secretary-treasurer, has been appointed acting manager.

L. F. Pearce has been retained by W. S. Barstow & Company, the new owners of the Columbia Railway, Gas & Electric Company, Columbia, S. C., in the office of secretary and treasurer. Under the former ownership at Columbia Mr. Pearce was secretary.

T. S. Nicholson, an employee of the Arkansas Central Power Company, has been made assistant to Harry U. Wallace, assistant general manager of the Knoxville Power & Light Company, Knoxville, Tenn.

N. D. Wilson, who has been associated with the Toronto Transportation Commission as head of the traffic study department, has left Toronto for Mexico City, where he will conduct studies and report on routing and traffic for the Mexico Tramways. His work with the Transportation Commission centered about the economic and engineering aspects of traffic matters. When he returns from Mexico at the end of the year Mr. Wilson will resume his duties with the Toronto Transportation Commission as head of the traffic study department.

Obituary

In Memory of John M. Roach*

Calmly and unafraid, as ever, John M. Roach became one with the eternal on the eighth day of March last. But in the memory of his countless friends he will never die, for his were the qualities upon which true friendships are builded.

A strong man, he accomplished greatly; his achievements (like those of so many of his kind) rebuking and refuting the oft-uttered weakling assertions that the age of opportunity has passed. The story of his struggles and his successes is inspiring. From the foot of the transportation ladder he climbed to executive eminence. By labor intense and probity unquestioned he became one of the commanding figures of our industry. For more than half a century he exemplified that genius for unremitting toil which is the basis of our national prosperity. Twenty-four years ago he was president of this association, and as such contributed to our early growth and influence. We owe him much.

Combative when combat was his duty, he was withal a kindly man—sympathetic, generous, delighting in good works. His ears were never closed to appealing voice or circumstance. Mercifully he considered the poor, the fatherless and the afflicted. He walked uprightly and spoke the truth.

The suggestion that life could be burdensome came to him but little more than a twelvemonth since and took him—a veteran of threescore and eleven—from his Chicago home to the sunshine and sofe breezes of Florida. For a while there was hope, but before spring came north again this year his undaunted spirit, fearing no evil, strode through the valley of the shadow to the mysterious realm where the earth-wearied conquerors are forever re-energized.

To those who are of his kin—the near and dear ones—our association tenders this wholly inadequate expression of high regard for its departed leader and of its heartfelt sympathy with those who were of his household.

Randall Montgomery, vice-president of the Pennsylvania-Ohio Electric Company, Youngstown, Ohio, died recently at the age of 73 years. It was in 1889 that he became identified with public utility work, becoming general manager of the Youngstown Electric Company. He later became vice-president and continued in this work until the time of his death. Mr. Montgomery was born in Youngstown and he spent his entire life there. He was educated in the local schools and began his career as clerk in a grocery store. He was active in politics. In 1888 he was elected on the Republican ticket as Mayor of the city and was re-elected two years later. In 1897 he was appointed to the city commission, serving thereon for three years.

Major William A. Garrett, transportation manager of the Baldwin Locomotive Works, died recently at his home in Moylan, Delaware County, Pa., at the age of sixty-three years. Mr. Garrett, in 1917, was appointed by President Wilson a member of the United States Railroad Commission. He was a leading railroad executive, and was an expert on transportation matters in general. He was a member of the transportation committee of the Chamber of Commerce of Philadelphia, and chairman of the transportation committee of the Middle States and Atlantic Advisory Board.

---

*Prepared by Gen. George H. Harries, chairman of a committee appointed for the purpose, and presented before the American Electric Railway Association at its session at Atlantic City, N. J., on Friday, Oct. 10, 1924.

Manufactures and the Markets

News of and for Manufacturers—Market and Trade Conditions
A Department Open to Railways and Manufacturers
for Discussion of Manufacturing and Sales Matters

Changing Trend in Pole and Tie Timber

The total number of cross ties purchased by electric and steam railroads in the United States was considerably less during 1923 than it was twelve years ago. Similarly the number of wood poles bought was less, although in this case the decrease was not so marked. From figures published by the Department of Commerce it appears that the purchase of ties goes in cycles, 1907, 1911 and 1923 being comparatively big years, while 1909 and 1915 were rather lean years.

Important changes have taken place during this period in the kinds of timber used for cross ties. Southern pine, chestnut, cedar, and Western yellow pine have declined noticeably in popularity. That is to say, their use has been much curtailed, although in many cases this is due to difficulty in obtaining this wood rather than preference for other varieties. The use of maple, gum and beech has increased to a marked extent. Oak, always the most popular wood for ties; Douglas fir, cypress, larch, hemlock and redwood were used in approximately the same quantities in 1923 as in 1907. Approximate figures showing the purchases of different varieties are given in an accompanying table.

Less change is noticeable in the number of poles purchased by the electric and steam railroads and by power, telephone and telegraph companies, all of whose purchases are lumped together in the figures announced by the government. Moreover, there appears to be little change in the relative popularity of the different woods used for this purpose. Detailed figures are given in the accompanying table.

SUMMARY OF WOOD TIE PURCHASES IN FIVE TYPICAL YEARS

Kind of Wood	1923	1915*	1911	1909	1907
Oak	62,915,237	49,333,881	59,508,000	57,132,000	61,757,000
Southern pine	22,048,967	14,115,681	24,265,000	21,385,000	34,215,000
Douglas fir	15,316,571	6,950,910	11,253,000	9,067,000	14,525,000
Cypress	5,243,835	4,478,612	5,857,000	4,589,000	6,780,000
Chestnut	4,419,782	4,548,352	7,542,000	6,629,000	7,851,000
Tamarack or larch	4,220,194	3,858,098	4,138,000	3,311,000	4,562,000
Cedar	3,676,228	5,122,103	8,015,000	6,777,000	8,954,000
Hemlock	3,477,740	859,662	3,686,000	2,642,000	2,367,000
Gum	3,050,798	485,466	1,293,000	378,000	15,000
Maple	3,035,007	1,069,547	1,189,000	158,000	....
Redwood	2,492,445	563,685	1,820,000	2,088,000	2,032,000
Beech	2,279,221	1,173,490	1,109,000	195,000	52,000
Western yellow pine	1,340,007	1,402,836	2,696,000	6,797,000	5,019,000
Lodgepole pine	949,451	1,316,819	....	....	....
Birch	369,154	465,815	....	....	....
All other	1,141,480	1,361,694	2,682,000	2,603,000	5,574,000
Total	135,976,117	97,106,651	135,053,000	123,751,000	153,703,000

* Based on reports from railroads representing 78.46 per cent of total mileage. Estimated total for all railroads, 123,766,000.

RELATIVE POPULARITY OF THE DIFFERENT WOODS USED FOR POLE TIMBER

Kind of Wood	1923	1915	1911	1909	1907
Cedar	1,702,247	2,521,769	2,100,144	2,439,825	2,109,477
Chestnut and oak	817,259	851,085	893,079	844,908	706,732
Pine	402,393	546,233	161,690	179,586	155,960
Cypress	73,403	67,644	72,995	77,677	100,368
All other	65,492	91,233	190,112	196,744	210,731
Total	3,060,794	4,077,964	3,418,020	3,738,740	3,283,268

United States Steel Corporation Purchases Cyclone Properties

The properties of the Cyclone Fence Company have been purchased by the United States Steel Corporation. The transfer includes the Cyclone factories at Waukegan, Illinois and Cleveland, Ohio, also plants at Fort Worth, Texas and Newark, N. J.

No change in policy is contemplated, the business to continue under the name of the Cyclone Fence Company, carrying on, with the exception of its principal officers, under its present organization as a subsidiary of the corporation.

Petition in Bankruptcy Against Standard Equipment & Machinery Company

An involuntary petition in bankruptcy has been filed in the United States District Court at St. Louis against George H. Tontrup, doing business as the Standard Equipment & Machinery Company, St. Louis, Mo. The National Safety Car Company, in which Mr. Tontrup is interested, is also in the bankruptcy court. The petitioning creditors of the Standard Equipment & Machinery Company were the Liberty Foundry Company, with a claim of $435; Beck & Corbitt Company, $104, and St. Louis Machinery Supply Company, $174.

Large Orders for Steel Wheels

The fundamentally sound condition of the electric railway industry at this time is well indicated by the continued large purchases of steel wheels. The Standard Steel Works, Philadelphia, reports that in spite of the business depression prevailing somewhat generally at the present time orders received from electric railways since June 1 for steel wheels have been in as large volume as for a similar period last year.

G. E. Orders Decrease

Orders received by the General Electric Company, Schenectady, N. Y., for the three months ended Sept. 30 totaled $58,389,832 as compared with $65,483,549 for the similar quarter in 1923, or a decrease of 11 per cent. For the first nine months of the present year orders totaled $203,097,719, compared with $229,747,304 for the similar period in 1923, a decrease of 12 per cent.

Metal, Coal and Material Prices

Metals—New York	Oct. 14, 1924
Copper, electrolytic, cents per lb.	13.125
Copper wire base, cents per lb.	15.125
Lead, cents per lb.	8.05
Zinc, cents per lb.	6.65
Tin, Straits, cents per lb.	49.875
Bituminous Coal f.o.b. Mines	
Smokeless mine run, f.o.b. vessel, Hampton Roads, gross tons	$4.30
Somerset mine run, Boston, net tons	2.075
Pittsburgh mine run, Pittsburgh, net tons.	1.875
Franklin, Ill., screenings, Chicago, net tons	1.375
Central, Ill., screenings, Chicago, net tons	1.175
Kansas screenings, Kansas City, net tons.	2.35
Materials	
Rubber-covered wire, N. Y., No. 14, per 1,000 ft.	$6.25
Weatherproof wire base, N. Y., cents per lb.	17.75
Cement, Chicago net prices, without bags.	2.20
Linseed oil (5-lb. lots), N. Y., per gal.	1.08
White lead, in oil (100-lb. keg), N. Y., cents per lb., carload lots	0.12
Turpentine (bbl. lots), N. Y., per gal.	0.87

Rolling Stock

Wisconsin Power & Light Company, Fond du Lac, Wis., lost two new Mack buses and a Faegeol bus in a fire which swept the garage, in Madison, where the buses were stored.

United Railways, St. Louis, Mo., through its subsidiary, the St. Louis Motorbus Company, has placed orders for four buses with the White Company, Cleveland. The buses will seat 29 passengers and cost approximately $35,000. Delivery will be made about Nov. 1.

Lake Charles Electric Company, Lake Charles, La., recently purchased from the Houston Electric Company six standard single-truck Birney cars, which have entirely replaced the two-man cars formerly operated.

Toronto Transportation Commission, Toronto, Canada, has ordered 3 White bus chassis and is building bodies for them at the Hillcrest shops. The seating capacity will be 29.

Tampa Electric Company, Tampa, Fla., recently purchased seven of the latest type cars from the American Car Company. The new cars will have a seating capacity of 52 persons. The cars will be placed in service on the Sulphur Springs line.

Track and Line

Trenton & Mercer County Traction Company, Trenton, N. J., has decided to use a 90-lb. rail in the laying of new rails in Pennington in place of the 75-lb. rail at first decided upon. It is also said the line to Pennington will be extended to the far end of the town instead of ending near the center of the borough.

Cincinnati Traction Company, Cincinnati, Ohio, is laying approximately 2 miles of new rails on Gilbert Avenue between Sinton Avenue and the Eden Park entrance. The work is expected to be completed by Nov. 15.

Grand Rapids Railway, Grand Rapids, Mich., has laid 858 ft. of new track between Madison and Russell Avenues and 1,413 ft. between Russell and Eastern Avenues or nearly ½ mile of new roadbed and rails.

Pacific Electric Railway, Los Angeles, Cal., has been granted permission by the Railroad Commission to extend its Daisy Avenue line from its present terminus in the city of Long Beach at grade across several streets in the county of Los Angeles. The proposed line will be constructed under the tracks of the Los Angeles & Salt Lake Railroad 100 ft. north of Daisy Avenue. The cost is apportioned between the two companies on the basis that the Pacific Electric Railway shall pay one-half of the cost of the 22-ft. clearance in excess of the cost of a standard 14-ft. clearance.

The Milwaukee Electric Railway & Light Company, Milwaukee, Wis., plans to build an electric freight line from its Lakeside power plant to connect with the Chicago & Northwestern Railway system.

New Brunswick Power Company, St. John, Canada, has completed relaying about 2,000 ft. of single track in Fairville. In conjunction with the permanent paving work of St. John City, it is proposed to relay with high T-rails, concrete base and steel ties about 2,000 ft. of single track on St. James Street.

Erie Railway, Erie Pa., lately reorganized in conjunction with the General Electric Company, has plans under way for moving the tracks in the East Lake Road from the center of the road to the side of the street. The work is estimated to cost $85,000.

Power Houses, Shops and Buildings

Philadelphia Rapid Transit Company, Philadelphia, Pa., has purchased 12 acres of land in the section of Fifth Street and Olney Avenue, which will be used as a loop terminal for the extension of the Fifth Street trolley line, north from Olney Avenue. Purchase of the tract was made by the Motor Real Estate Company, a subsidiary organization of the Philadelphia Rapid Transit, from the Hilltop Land Company for $147,500, subject to mortgages of $112,000.

Lake Shore Power Company, Toledo, Ohio, has asked authority to issue $271,500 of 7 per cent preferred stock to finance improvements and purchase property jointly owned by the Toledo & Indiana Railroad and itself. The power company will install a new generator, coal crusher and conveyor, stokers, superheaters and other equipment for its power house.

Los Angeles, Cal.—Definite steps are being taken by a group of capitalists for the financing and erection of a new downtown subway terminal and office building to be built on the site of the Hill Street station of the Pacific Electric Railway. The cost will be between $3,000,000 and $4,000,000.

Baton Rouge Electric Company, Baton Rouge, La., will complete its new carhouse this month. The material for the carhouse has been ordered and the preliminary work is now being done. The building will be located on the site recently purchased from the State University.

Trade Notes

Roller-Smith Company, New York, N. Y., announces the appointment of the Thrall Electric Company, Presidente Zayas No. 27 and Esquina A Habana, Havana, Cuba, as its exclusive representative for the Island of Cuba. The Thrall Electric Company is primarily a sales and engineering organization carrying complete stocks of electrical machinery, instruments and supplies and operates over the entire island. The company also maintains the largest electrical installation department in Cuba. It will carry a comprehensive stock of Roller-Smith instruments and circuit breakers.

Globe Ticket Company, Philadelphia, Pa., has received an order from the Philadelphia Rapid Transit Company for approximately 60,000,000 transfers. This railway ordinarily prints its own transfers, but on account of the recent fare change it was desired to secure an unusually large number for use on short notice and this order was given to the Globe Ticket Company.

Conveyors Corporation of America, Chicago, Ill., has appointed W. P. MacKenzie Company, Philadelphia, as its sales representative in southeastern Pennsylvania and southern New Jersey. This organization will handle the sale of American steam jet ash conveyors, American cast-iron storage tanks, American airtight doors for ash pits and boiler settings, and other specialties.

Gibb Instrument Company, Bay City, Mich., manufacturer of electric welding machines and electric heating machines, has broken ground for a new modern plant.

White Manufacturing Company, Elkhart, Ind., maker of case-hardened brake pins and bushings for railway trucks, and other railway car parts, has completed a new factory at Elkhart, into which it moved on Oct. 1 from its previous location at Goshen, Ind. With it is associated the Chausse Oil Burner Company, maker of kerosene torches, railway switch heaters and asphalt street repairing machinery.

New Incorporation

East St. Louis, Caseyville & Eastern Railroad, East St. Louis, Ill., has been incorporated at Belleville, Ill., with a capital stock of $5,000. Among the incorporators were M. L. Munie, Finis P. Ernest, Jr., and Mrs. Marie Dacray, all of East St. Louis. They propose to establish an interurban line between East St. Louis and Caseyville via Washington Park. The line will handle both passengers and freight.

New Advertising Literature

Ajax Metal Company, Philadelphia, Pa., has issued a new Babbitt booklet entitled "Babbitt Facts." The booklet contains interesting information to users of babbitt and tells how to pick the best babbitt for every purpose and why the best babbitt should be picked.

Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., is distributing insulation guides for 500 to 600-volt railway equipments These guides are designed to be hung on the walls of railway repair shops where they may be referred to when equipment is being repaired. The different grades and forms of materials used for insulating various railway equipments and parts are tabulated in convenient form. The data card is known as H. C. 234.

Fageol Motors Company, Oakland, Cal., has issued a pamphlet, "It's Always Fare Weather." It is replete with illustrations of the Fageol Safety Coach in operation during severe snowstorms. Some complimentary letters to the Fageol company on what its motors are doing through the country are reproduced.

Buffalo Forge Company, Buffalo, N. Y., has given out some data for the factory management and small shop owner regarding the use and advantages of unit heaters in a bulletin describing Breezo-Fin heaters, manufactured by this Buffalo company. The text is amply illustrated, including tables of capacities and dimensions.

J. G. Brill Company, Philadelphia, Pa., has published "Brill Cars," a 60-page catalog designated as No. 277. In it are included exterior and interior illustrations, seating diagrams of various types of cars built at the Brill plants, and records of weights and general details. Tipped in the back there is a tabulation of dimensions and weights of all the cars illustrated in the catalog. Special equipment, including gasoline and gas-electric cars, Brill rail-less cars and Kuhlman steel coach and type "G" bus bodies are also illustrated.

Champion Switch Company, Buffalo, N. Y., has issued a 70-page booklet entitled "Indoor Bus Supports." The interchangeability of the Champion line of bus supports is described with illustrations. Besides general information on the Champion bus supports, the pamphlet shows the interchangeable parts, gives insulator detail and includes a numerical index.

Correct Bearing Maintenance May Save the Industry $3,000,000

MAINTAINING car bearings in operating condition, while one of the most essential jobs on a railway, is given little thought by any one outside the mechanical department. There are four or eight journal bearings on each car, and eight to sixteen motor bearings. With more than 100,000 electric railway cars this gives a total of more than 1,500,000 bearings in service. These are all expected to function perfectly at all times and under all conditions of load and weather. That they usually do so is a tribute to the skill of the designers and the men who maintain the cars.

Of course, bearings wear out in service and their periodical replacement is one of the routine jobs of car maintenance. Failures occur occasionally, and when they do the service is disrupted. Too much importance cannot be given to the inspection and maintenance of this humble device, so that repairs can be facilitated and road failures prevented.

The importance of the subject can be seen from the recent estimate of an engineer who states that the cost chargeable to motor bearings alone is annually some $6,000,000, and that half of this amount can be saved to the industry by better motor lubrication.

The survey on bearing practice, the first article of which appeared in the Aug. 16 issue of this paper, and the second appearing this week, points out some of the difficulties to be looked for and how they may be overcome. The present article shows the importance of correct methods of machining the bearings so as to obtain proper lubrication and so that they will fit properly. Both of these are essentials in keeping the car on the road instead of its being held in the shop.

Careful Fitting of Bearings Is Needed to Lengthen Their Life

AS SOON as a motor goes into service, wear starts between the armature shaft and the bearing lining, of which, incidentally, some 90 per cent is caused by foreign matter and dirt getting into the bearing. Apart from this normal wear, which can be determined with a certain degree of accuracy, the bolts which clamp the bearing in the motor shell frequently loosen, and wear then takes place on the outside of the bearing and on the inside of the frame fit. When loosening starts, it increases rapidly, due to the pounding action when the car operates over rough track, until the bearings get so loose that they become dangerous to operate. It is this looseness that is responsible for the greatest majority of bearing troubles and the short life obtained.

Trouble of this sort is most pronounced on the old split-frame motors of which there are still many in service, because railway managements feel that the expense of purchasing new ones is not justified. Although these motors are heavy they will operate satisfactorily and will stand heavy overloads under extremely trying conditions of service, provided they are maintained properly.

The problem of keeping the bearings of such motors in condition is difficult. A solution for much of the trouble, as disclosed in the survey of bearing practice, has been found by some roads where precautions are taken to insure a tight fit of the bearings in the motor shells and where careful attention is given to fitting each bearing to the shaft on which it operates.

Good results have been obtained on some railway properties by welding these bearing fits and reboring the motor frames. Where shops are properly equipped to handle this work, the cost of welding and boring does not exceed the cost of a new set of bearings. An additional advantage is obtained where the motors originally had cast-iron babbitted bearings, as the bearing fits can be filled in and rebored to a smaller diameter so that a standard type of bronze bearing can be used. By this method some roads have obtained reduction in bearing weights of from 50 to 60 per cent.

This class of work can be carried out on small railway properties quite as well as on larger systems and will produce surprisingly good results. The argument sometimes used that while a practice is all right for the big roads the little ones cannot follow it does not apply here. With such possibilities, the practice is well worth giving a thorough trial.

Car Brakes Can Be Improved

MUCH thought is being given these days to the improvement of car equipment for electric railway service. Efforts which at first were directed almost entirely toward reductions in weight and operating cost have subsequently included serious consideration of the merchandising aspects of the design. In the attempt to make electric railway cars more attractive to the rider, noise reduction, ease of riding, seat comfort, appearance, smooth starting and stopping, have all been given increased attention, and progress has been made in improving cars along these lines.

One important part of the car equipment which has apparently received little general consideration is the brake system. There seems to be excellent possibility for improvements in the present type of brakes that would reduce weight and maintenance cost and would at the same time improve the design from a ride merchandising standpoint.

On most cars, at present, the braking force is transmitted from a single brake cylinder to the brakeshoes through an expensive, noisy and heavy system of levers and rods. Developments in hydraulic and pneumatic automotive brakes have pointed the way toward simplification of this design.

Some simple adaptation of the diaphragm or cylinder constructions which have been developed for automotive air brakes might be applied to an axle-mounted drum on electric railway cars. Such a construction would substitute air piping direct to the brake diaphragms for the present cumbersome mechanical transmission system represented by the foundation brake rigging. It has even been suggested that the brake diaphragms might be mounted directly on the motor case and the drum be carried on an extension of the armature shaft so as to take advantage of the increased leverage obtainable through the motor gearing. For single-end equipment, this would give more uniform wear on both sides of pinion and gear teeth.

Of course space limitations will be encountered on some of the larger and heavier types of cars. Again there will be the necessity for some form of flexible connection at the trucks in the brake piping on double-truck cars. However, these difficulties do not appear insurmountable. Flexible brake pipe connections between cars are successfully used in train operation. Limitations of space might make it necessary on certain cars to apply the brakeshoes to the treads of the wheels as at present. If there is sufficient advantage in taking the brakeshoes off the wheel treads to justify it, the possibilities of specially designed wheel hubs to take the shoes have by no means been exhausted.

There are many more reasons for considering this subject of brake improvement than can be given in a brief discussion. Reduction in noise and rattle, better equalization of pressure, elimination of weight and expensive maintenance of levers and pins are only a few of the advantages to be derived. The advantages of low car floors from a merchandising and safety standpoint have been generally accepted. The problem of getting sufficient clearance for the present type of brake pull rod presents a serious limitation in reducing these floor heights. On some center-door cars it has been necessary to use two brake cylinders to get clearance for pull rods. This difficulty would be all eliminated by piping the air directly to brake cylinders or diaphragms mounted at the point of application of the shoes.

Undoubtedly the advantages to be derived from elimination of the foundation rigging more than justify careful study and experiment. This will require co-operation between the manufacturers and some of the larger operating companies.

Why Not Give Private Companies the Same Advantages?

WHEN explaining how the city of New York could operate rapid transit lines at a profit on a 5-cent fare, provided it had some of its own to operate, Commissioner Delaney, head of the City Transportation Bureau created as a part of the home rule law passed at the last session of the State Legislature, is reported to have said that the city would have a decided advantage because no income nor franchise taxes would have to be paid, and money could be borrowed at 4½ per cent instead of 6 per cent. Is this admission a sign that the municipal authorities have seen a great light? One would have supposed from the past remarks of Mayor Hylan and his supporters on the subject of transit that inefficient management and the desire for exorbitant profits were the only reasons that the private companies could not operate satisfactorily on a 5-cent fare. Now it appears that the city authorities realize how heavy the tax burden of the railways really is.

If the Mayor of New York is genuinely anxious to give the people good transportation for a nickel fare, he might begin by advocating the abolition of the franchise and other taxes now collected from the private companies. They would then share with the proposed municipal system the advantages of which Mr. Delaney speaks. Of course, there would not be any true economy in such a scheme. Still more of the present cost of operation would be shifted from the car rider to the taxpayer, for it is a well-known fact that the interest on the city's subway investment is not being earned in full by the operating companies, but the deficit is being made up by general taxation. But Mr. Delaney admits that that is what the city would do if it had its own lines. Why not do it now without waiting for the completion of proposed routes whose construction has not yet been begun?

Boston Wage Award Forces Fare Increase

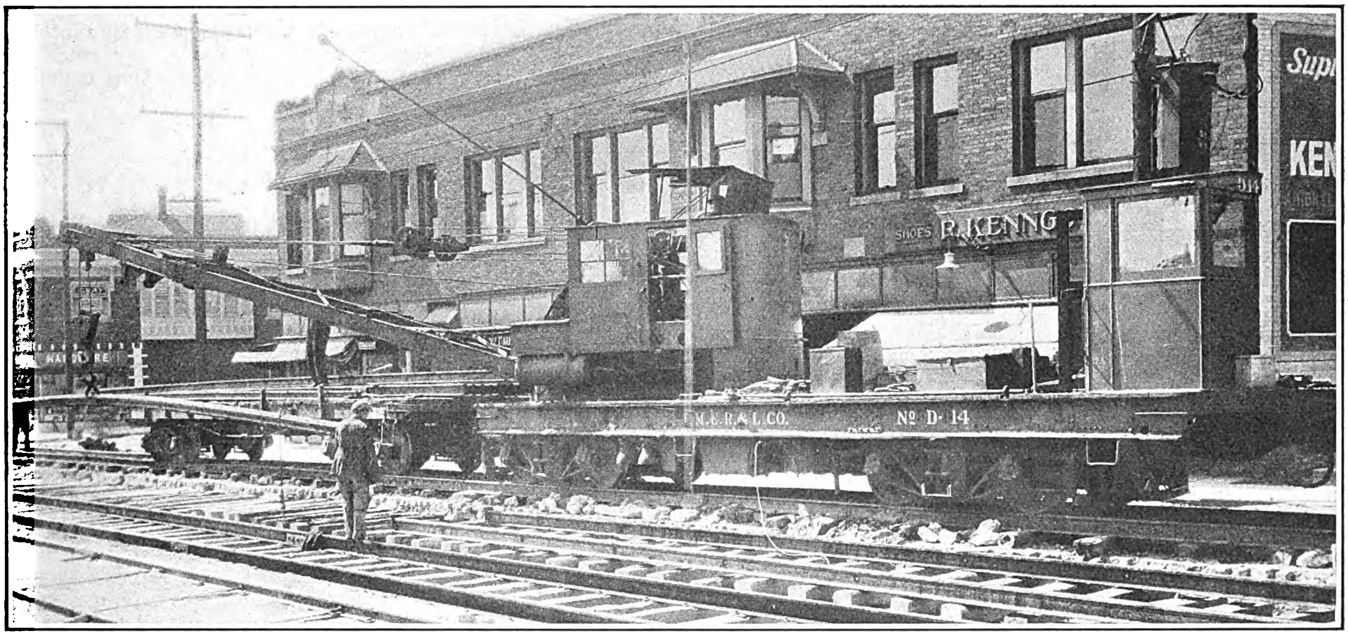
FARES on the so-called community lines of the Boston Elevated Railway, patronized by a million people last year, will go to from 5 cents to 6 cents on Nov. 1. This is the first and immediate effect of the arbitration award under which the men have just been granted an increase in wages of 2½ cents an hour at a cost to the company estimated at $500,000 for this year. Moreover, there may be a curtailment in the number of 6-cent routes. There most certainly will be more one-man cars.

In the face of the facts it is impossible to agree with the finding of the majority of the board. Again the plea is advanced that the wages to be paid to the employees in Boston should be entirely independent of the prosperity of the enterprise. In discussing the influence of public control on the rate of wages, Mr. Mulcahy, arbitrator for the company, has aptly said that the public should not be permitted to assert its interest against a particular group to deprive that group of a minimum fair living wage, but that after this minimum had been exceeded it was in the interest of every one concerned, not the least of all the employees themselves, that the wage award might not cripple the industry or unduly restrict it in the performance of its service.

As the Boston *Post* sees it, "there can be no serious complaint on the part of the public to the increase," but this expression of opinion was rendered before it had been established as a fact that fares would have to be raised. It would seem that the car riders, many of whom are not nearly so well paid as the trainmen, would be much more likely to agree with the opinion expressed by the Boston *Transcript* and sympathize with the argument of the minority report rather than that of the majority, particularly as the men were granted a 15 per cent increase only last year. In this particular case both the user and the non-user of the system pay, because under the public control act the deficits are made up by proportional assessments against the local communities and these advances are returned only if the earnings of the company permit. Fear was expressed in an editorial in the ELECTRIC RAILWAY JOURNAL for Sept. 13 that this fact might again be used to increase the wages of a favored group of employees. In the present instance this is just what has been done.

Work Train Employees Share in Profits

Utility Division of Way and Structures Department of the Milwaukee Electric Railway & Light Company Provides a Bonus Each Month for Workmen's Efficiency—Work Done for All Departments Is Credited at Predetermined Rates, and Cost of Operation Is Then Deducted to Determine Net Return



Service Trains of the Milwaukee Electric Railway & Light Company Do Work for the Way and Structures Department at Predetermined Rates

AS AN incentive to increase the number of ton-miles of materials hauled per hour of active duty for each piece of equipment and to improve the efficiency of the workmen the utility division of the way and structures department of the Milwaukee Electric Railway & Light Company has inaugurated a profit-sharing plan whereby all employees of this division receive a bonus each month that the division shows a "profit" on its operation. The bonus to employees represents 40 per cent of the net return after deducting the total expenses of the division from the total output credited at predetermined rates for utility service rendered to all departments of the railway.

Before a fair bonus plan could be put in operation it was necessary to place the work of the utility division upon a business basis. The first step in this direction was the classification of work. Utility service is the transportation of material for the construction, operation and maintenance work of the entire company. The operation of sand, salt, sprinkler and money cars, locomotives and snow-fighting equipment, line cars, etc., which is controlled by other departments than the way and structures, does not enter into the bonus plan. Work train equipment operated by the way and structures department under the "Utility Special Account" consists of motor and derrick cars, Differential side dump motor cars, Koppel center dump trailers, Differential side dump trailers, double-truck flat cars and single-truck flat cars.

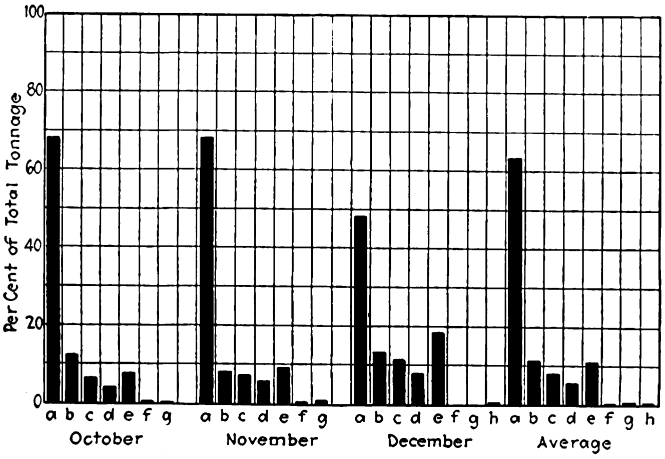
This utility service is available to all the departments of the railway, but as it was found that the way and structures department made more use of the service than did any other department it was deemed advisable to make the utility division a part of it. Chart 1 shows the distribution of work performed by the utility division for the various departments.

HOW THE PLAN WORKS

Orders for the transportation of material are received at the office of the utility division located in the way and structures department material yard. They are then classified and the trains dispatched. Ordinary shipments require one day's notice, but in special cases arrangements can be made on shorter notice. After a motorman receives his orders and leaves for his trip, he keeps in touch with the utility office, calling in for orders over the company's telephone system. A utility service delivery order and freight bill is filled out in quadruplicate by the motorman operating each train assigned to this work. It contains spaces for all necessary information relative to the shipment. The motorman fills out only the names of the sending and receiving points, date, weight, description of material and department for which the work was done. One copy goes to the foreman on the job and two copies—the original and a carbon—to the way and structures department office. The remaining copy is retained in the motorman's order book.

The two copies sent to the way and structures department are forwarded to the accounting department, where the remaining blank spaces are filled in with the rates and price of the job. The job order or work order to which the job is to be charged are also noted on this form.

In addition to routing the utility trains, the office of the division also keeps a daily record of the hours



Way and Structures Department Makes Greatest Use of the Utility Service

a. Way and structures.	*e.* Power plant.
b. Transportation.	*f.* Purchasing.
c. Rolling stock.	*g.* Lakeside.
d. Electric distribution.	*h.* Miscellaneous

each piece of utility equipment is in use. The information is obtained from the motormen's order books, in which are the copies of all delivery orders filled by them each day. This sheet is arranged so that every detail on the order sheets may be tabulated. As will be seen in the accompanying illustration the headings across the top of the sheet are such as to facilitate the work of the clerk as much as possible. The motor car numbers are listed vertically and the information filled in opposite the number of the car which was used for the particular job. A monthly summary of the daily reports is compiled by the utility division, showing the complete figures on the motor and trailer equipment.

For the purpose of simplifying the accounting work and to determine the rates, materials which are handled have been divided into three general classes:

Class "A" Materials.

All materials (except Class "C" materials) which can be handled in bulk in dump cars, such as:

Cinders (power plant)	Rejection gravel
Coal	Sand (in bulk)
Gravel	Asphalt
Crushed stone	Paving blocks
Screenings	Etc.

Class "B" Materials.

All materials and shipments not specifically included in Class "A" or Class "C" materials. Including ties, tie plates, sewer pipe, cement, poles, track tools, cable, car wheels, axles, conduit, stone dust and package freight that cannot be dumped.

Class "C" Materials (Special).

Coke.
Ashes from car stations.
Dirt from construction work.

After classifying the material hauled, it was necessary to determine the proper rates for each classification. This was first accomplished by determining the number of hours the equipment is used per year and the number of ton-miles hauled and dividing the special accounts covering the expenses of the utility service by these figures.

In this manner two sets of rates were established, one based on a ton-mile haul and the other on an hourly basis for equipment with or without crew. The ton-mile rates for the above classification of material hauled vary from 2½ cents to 31¼ cents, depending upon the character and volume of the material. In the case of ashes hauled from car stations and dirt from construction work, which are carried at a rate of 2½ cents per ton-mile, an allowance of only 1½ hours per round trip is included in this rate for loading and unloading. Any additional time required per trip is charged for at the regular car-hour rate.

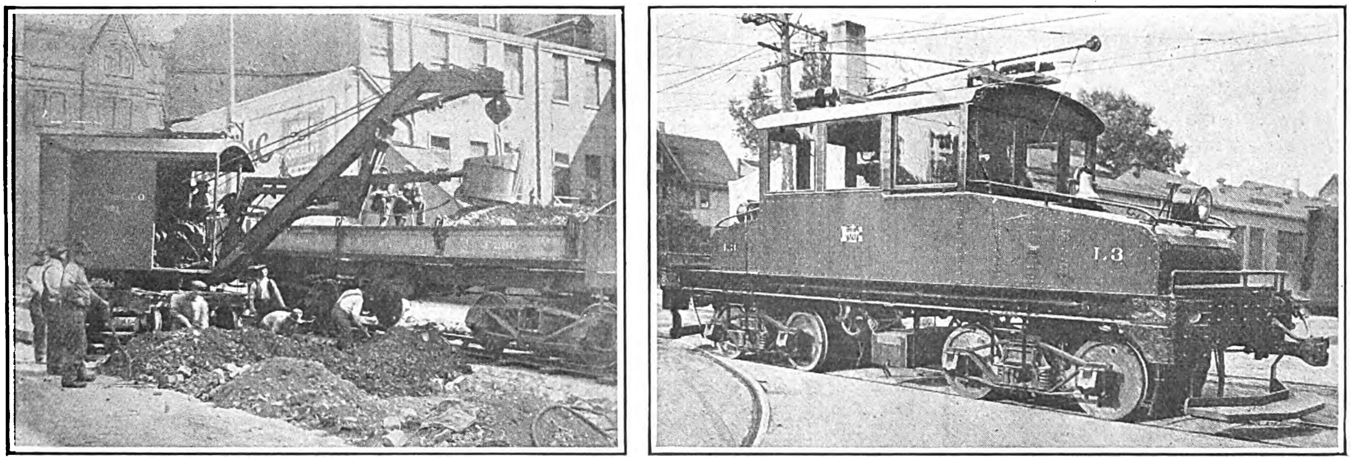
IMPORTANT *TO BE FILLED OUT BY SHIPPER A SEPARATE UTILITY ORDER SHOULD BE MADE OUT FOR EACH CHARGE ACCOUNT AND IN CASE OF WORK ORDERS FOR EACH [illegible] CHARGE UTILITY ORDERS SHOULD NOT BE DESTROYED IF VOIDED SAME SHOULD BE FORWARDED TO THE ACCOUNTING DEPARTMENT. THE UTILITY ORDER WILL NOT BE HONORED BY THE WAY & STRUCTURES DEPARTMENT UNLESS ALL THE INFORMATION CALLED FOR IS PROPERLY FILLED OUT.

Duplicate Should Be Retained By the Way & Structures Department After Delivery Is Made.

Forms Used by the Utility Division Show Details of Work Done by Each Piece of Equipment

These car-hour rates have been computed from the various expenses itemized in the special accounts with the exception of labor. The latter item has been computed separately so that it is possible to establish rates for the use of equipment with or without crews. Having the total of all charges on a piece of equipment, a "use factor" is introduced by which it is possible to figure the hourly rate. This factor represents the percentage of use per day, for the previous year, using 24 hours as the length of a day. Utility equipment is charged for on an hourly basis only under the following conditions: (1) When it is necessary to make emergency partial trainload shipments; (2) when equipment is required for diversified use, such as moving work gangs, moving tools and cleaning up débris; (3) when equipment is used for special purposes such as switching freight, etc.



Left—A Single-Truck Electric Shovel Is Part of the Utility Division Equipment.
Right—Freight Switching Is Done by Electric Locomotives of This Type

The expenses for utility service are divided into two classes—operating expenses and fixed charges. Under the first are included superintendence, operating labor, miscellaneous supplies and expenses, power, light and heat, maintenance of equipment, maintenance of buildings, fixtures and grounds. The second classification represents the fixed charges, which are divided as follows: Injuries and damage, insurance, depreciation and taxes.

The rates have been fixed on such a basis that ample return may be obtained from the present operation of the equipment, and with the existing possibilities of reducing the expenses an opportunity is presented to increase the bonus. Certain expenses exist over which the operating employees of the utility division have no direct control, such as the unit maintenance cost. These are corrected periodically to allow for changing costs. The bonus paid to employees amounts to 40 per cent of the gross profits earned by the operation of the utility division. This sum is distributed according to the participating wages of the various employees. In this plan, as in other bonus plans of this company, participating wages are limited to $200 per month. This limitation, however, applies only to supervisory employees. The bonus is paid for each month that the division shows a profit. On the other hand, the employees' wages are not reduced if there is a loss resulting from the operation, but they receive no bonus.

Fixed charges are included in the bonus computations because they are necessary to arrive at the true profit. These charges are taken as 6.5 per cent of the valuation and consist of 3.5 per cent for depreciation, 2 per cent for taxes and 1 per cent for insurance. Inclusion of these items discourages securing unnecessary equipment, because such equipment increases the valuation without producing a corresponding increase in the revenues. The actual valuation of the utility equipment is $390,854. The percentage for depreciation has been made so as to correspond closely to the actual life of the equipment. Figures approved by the Wisconsin Railroad Commission gave the life of the car bodies and trucks as 25 years and that of motors from 15 to 20 years. Based on these figures the rate of 3.5 per cent has been adopted.

In ordinary calculations of this nature the fixed charges do not vary from month to month, except as the value of the equipment changes. If a flat monthly rate were followed in this plan it would create a heavy expense in the winter, in proportion to the amount of work done, and would almost prohibit the earning of a bonus during this season. For this reason, the annual fixed charges have been so distributed that they follow the trend of the revenue. Thus they are higher in the summer than during the winter because a greater amount of work is done by the division during the summer. This varying fixed charge aids the employees in earning a profit in slack seasons. The variable percentages which are applied to the fixed charges in order to determine the charge for each month of the year are calculated in Table I. They are arranged so as to vary in the same ratio as the revenues.

An example showing the operation of the bonus system for a six months period is given in Table II. From the table it will be seen that during the six months period the revenues exceeded the expenses for each month. Therefore each month the employees received a bonus amounting to 40 per cent of the profit made the preceding month. In computing the profits for a month, the bonus which is paid during that month for the efficient operation in the previous month is included in the expenses. Every month an analysis is made of the special accounts showing the amount of expense chargeable to each item and the amount of output or credit received. As a part of this report a comparison is made between the figures for the current month and those for the same month a year ago. Another interesting feature of this report is the statement of profit or loss for the month and also a year ago and in addition the cumulated profit or loss for the present year to date compared with a similar period a year ago. This analysis for June, 1924, is shown in Table III.

TABLE I—DETERMINATION OF VARIOUS PER CENTS FOR THE FIXED CHARGES FOR MILWAUKEE UTILITY SERVICE

Month	1918	1919	1920	1921	1922	Total	Per Cent of Total	Apportionment of Fixed Charges, per Cent Actual	Apportionment of Fixed Charges, per Cent Adjusted to Smooth Curve
January	$5,214	$4,698	$7,154	$5,226	$4,655	$26,947	3.82	0.25	0.33

December	5,207	19,457	12,783	6,301	12,335	56,083	7.95	0.52	0.53
Total	$96,163	$148,518	$148,997	$147,201	$164,427	$705,306	100.00	6.50	6.50

NOTE.—All output figures used above have been computed to the same basis of rates.

Possibilities of effecting savings in the total wages in the miscellaneous supplies and expenses and in the maintenance expenses are obvious. Means of reducing the power costs and the fixed charges are as follows: The power costs, while now obtained through the use of meters on the motor cars, were formerly determined from the car mileage. Separate standards of power consumption per motor car-mile, per double-truck trailer car-mile and per single-truck trailer car-mile were established. These were used in determining the power consumption. The employees may reduce this consumption per day by increasing loads and eliminating empty operation. With the installation of meters on motor cars, further savings can also be made by the economical use of power.

One item of the fixed charges which offers a chance for savings is that of injuries and damages. These include accidents and damages to persons or property. For the year 1923 these have been taken as 10 per cent of the revenue in place of the actual expenditures. This is done in order to avoid excessive fluctuations in the profits whenever large settlements are made. The ratio of 10 per cent represents approximately the amount of these expenses during 1922 and is revised at the close of each year to represent the amount actually expended during the year. For the year 1924 the figure is 8.62 per cent, this being lower than that used during 1923, mainly because of the greater output of the division during the past year. It is the object of every employee to reduce accidents in order to secure a low rate for each ensuing year.

Because of the utilization of the utility rates for bonus purposes, careful correction is made for changes in the actual costs due to conditions not under the control of the employees. The most important of these are changes in the wage rates of the direct labor and in the unit maintenance costs. The percentage increase in utility rates is computed by multiplying the increase in the wage rate by the percentage the total wages, exclusive of the bonus, is of the total expenses. The unit maintenance costs depend largely upon the wage rates in effect in the rolling stock department and upon the material costs. As the entire cost of the maintenance of equipment is but 13.33 per cent of the total expenses, it is not advisable to construct a complicated index for correcting material costs. It is sufficiently accurate to assume that the material costs vary in the same ratio as wage rates of that department. The utility rate correction for changes in the unit maintenance costs is computed in the same manner as is the correction for changes in direct labor wages.

This plan to decrease unit costs, besides exerting a very strong influence to curb the expenditures, aids the employee to see operating conditions from the standpoint of his employer and enables him to grasp the fundamental law of profit sharing, namely, that profits can be shared only after they have been earned.

Even with correction of rates and adjustment of costs the bonus earnings under this plan have continued to rise. One reason for this is that in the past no urgent incentive has been offered to increase the output per hour of active duty for each piece of equipment or to decrease the time of empty travel. Employees as a rule are not interested in the number of pieces of equipment owned or in how many of them stand idle on the storage tracks. They do not realize that every hour of labor which does not produce causes the expenses to rise without a corresponding return.

TABLE III—ANALYSIS OF SPECIAL ACCOUNTS, JUNE, 1924, COMPARED WITH JUNE, 1923, MILWAUKEE UTILITY SERVICE, WAY AND STRUCTURES DEPARTMENT

Accounts	June, 1924 Amount	June, 1924 Per Cent of Cost	June, 1923 Amount	June, 1923 Per Cent of Cost

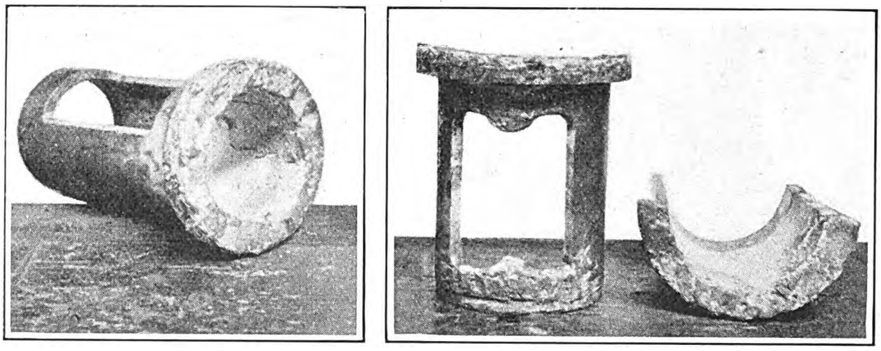
Survey of Armature, Axle and Journal Bearing Practice

Second Article

Machining, Cutting Oil Grooves and Finishing Railway Car and Motor Bearings —Clearances and Methods of Fitting Discussed—Building Up Worn Housings and Bearing Flanges — Proper Thickness of Babbitt in Finished Bearings — Recommended Allowances for Pressing and Precautions to Insure Tight Fits

THIS article, the second on the subject of bearing maintenance, deals with methods employed for machining the bearings, cutting oil grooves, and other work necessary to produce a finished bearing, together with the precautions which are used by electric railways when reinstalling the bearings in cars to insure that proper fits are obtained so that adequate service will result. Information for this analysis was obtained from a survey of the armature axle and journal bearing practice, as found by personal visits by the editors to 20 electric railways.

The first article on this subject, published in the Aug. 16, 1924, issue of ELECTRIC RAILWAY JOURNAL, contained an analysis of practices used by the same 20 railways. Information was given as to the types of bearings favored, the methods used to determine wear, practice in taking the bearings from the cars, the removal of old babbitt metal from the bearings, equipment and methods used in cleaning and tinning the shells and otherwise preparing them for rebabbitting, the compositions of babbitt metal used, and the precautions that are necessary while pouring the babbitt and preparing the mandrels for use.



Left—Armature Bearing Flange Built Up by Means of Oxyacetylene Welding Adds Approximately 50 per Cent to Its Life. Right—Axle Bearing Built Up by Means of Acetylene Welding on the Thrust Flanges and Other Parts Badly Worn

The bearing most commonly used on electric railway rolling stock consists of a shell of bronze or malleable iron lined with babbitt. There is, however, a decided tendency away from the babbitt lining for armature bearings. Motor manufacturers are now furnishing a bronze type of bearing with thin tin lining almost entirely with their new motors.

In the fitting of new bearings, it is necessary to machine both the outside and the inside, since the bearing itself must fit into a motor shell or housing, as well as provide an accurate inside fit with the shaft or journal. The ideal with regard to the inside fit is to provide enough clearance to allow a thin film of oil to form between the stationary and rotating parts so that the supported part actually will float on it. Running friction will then be reduced to a minimum, and while the film exists no wear of the metal surfaces can take place. In addition to giving the correct clearance it is necessary to provide oil grooves in order to keep the film of oil constantly in the bearings during rotation. Dirt and water must also be kept out or excessive wear will result.

The average finished thicknesses of babbitt required in babbitted bearings was found to vary from 1/16 in. up to ½ in. on 18 of the roads from which information was obtained. The thicknesses most frequently used are given in Table I.

FITTING BEARINGS TO WORN SHAFTS

Axles and armature shafts wear with use, normal factors of safety permitting a variation in diameter of perhaps ¼ in. between the size new and the size where the part must be scrapped, built up or re-turned to smaller size. Hence bearings must be provided with a variety of bores in order to give proper clearance for correct lubrication. In some cases this variation is taken care of with different thicknesses of the babbitt lining, and in others shells of different inside diameters are used with the babbitt of approximately uniform thickness. The practice on several roads is given in the following paragraphs:

At the Decatur shops of the Illinois Traction System, shafts scored or worn tapered are turned to true them up. Standard practice is to provide a layer of babbitt approximately 1/16 in. thick in bronze shells. Where measurements show that the bearing previously used will require a greater thickness of babbitt another bronze shell is used. This may be either a second-hand shell of proper size or a new bronze shell bored out, so as to allow 1/16 in. of babbitt in the finished bearing. Every time a bearing is installed on an armature shaft a number is stenciled on the flange. When it is used a second time, the old armature number is removed and the new one replaces it.

In the design of bearings used by the Milwaukee Electric Railway & Light Company, the amount of babbitt to be left in a finished bearing is determined by the air gaps in the various motors, so that if all the babbitt were burned out, it would not allow the arma-

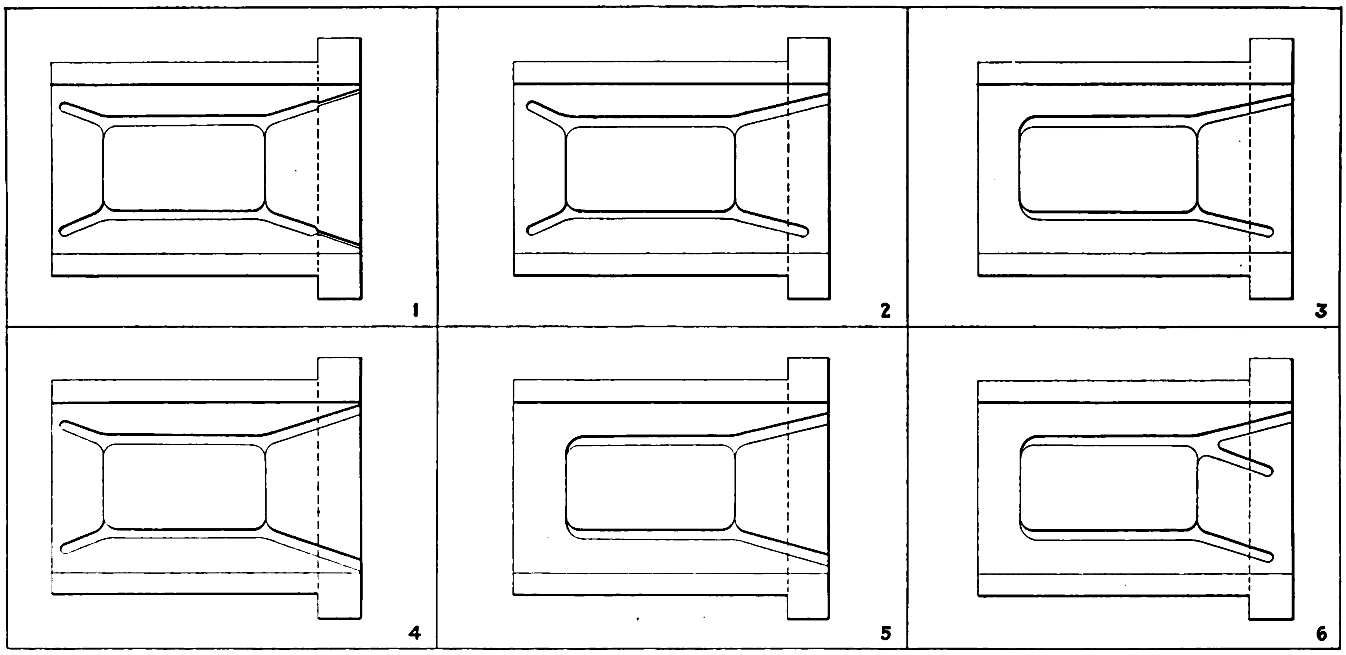
ture to drop upon the pole faces. For a GE-216 motor, 3/32 in. thickness is left; for a GE-80 motor 1/16 in., and for a Westinghouse 508 motor 1/16 in. It is seldom found necessary to turn down an armature shaft. Axle bearings are finish turned and are then kept in the storeroom until issued. One of the interesting features of the machining process is the method used to finish the joining surfaces of split bearings. This work is done on a Gardner power-driven horizontal abrasive grinding stone. Formerly this work was done on a milling machine or shaper, which took approximately five times as long as the present process. The grinding is done after the castings have been cleaned, but before they are turned in a lathe.

For its axle bearings the Omaha & Council Bluffs Street Railway uses cast-steel shells lined with babbitt almost entirely, except where the diameter of the axle is so close to that of the bearing housing that there is not room for a babbitt-lined shell. The minimum difference in diameter between the axle and the bore of the housing considered sufficient for the babbitt lining is 1 in., or a thickness on each side of the axle of ½ in. The practice is to use 3/16 in. to ¼ in. of babbitt. Thus the minimum amount of babbitt allows 5/16 in. thickness for the cast-steel shell. If the clearance between the axle diameter and the bearing housing bore is less than this the solid bronze bearing is used, as on some types of motors where it has been necessary to increase the diameter of the axles. Axle bearings are babbitted to predetermined standard sizes, and are not bored when put on the axle. To provide for axle wear it is necessary to mold bearings to several sizes, which vary in steps of about 1/16 in. When an axle wears so as to give excessive clearance it is turned down to the next size, and the nearest standard oversize bearing is used thereafter until it is again necessary to repeat the performance.

Armature bearings in Omaha are bored to individual fit for each particular armature shaft at the time that they are installed. The practice after babbitting these bearings is to broach them to certain standard sizes, in which they are carried in stock. When a call comes from the armature room for a set of bearings, the babbitt is then bored out to fit the individual armature shaft.

Steel shells are favored for armature bearings as well as for axle bearings. Although no cost figures were available it is considered that the cast-steel shells and babbitt lining produce a saving in cost over bronze shells.

The practice of the Third Avenue Railway, New York, is to provide an average thickness of babbitt of from ¼ in. to ⅜ in., and in fitting bearings three sizes are used. For example, for a 4½-in. shaft new bearings are bored out to 4½ in. plus clearance. When the bearings are romoved at an overhauling the shaft is gaged. If the shaft allows a snap gage of 4.44 in. to pass over it, it is turned down to 4.4 in. diameter, and a bearing of 4.4 in. plus clearance is used. The next time the shaft comes in, if a gage of 4.34 in. passes over it, it is turned down to 4.3 in. diameter, and a bearing of 4.3 in. plus clearance is used. Whenever a



Arrangement of Oil Grooves as Used by Various Railways

1. Used in Brooklyn. 2. Used in Youngstown. 3. Used by Third Avenue Railways, New York City. 4. Used by Georgia Railway & Power Company, Memphis Street Railway, New York, Westchester & Boston Railroad and Niagara, St. Catharines & Toronto Railway. 5. Used by Chicago Surface Lines, Denver Tramway and New York & Queens County Railroad. 6. Used in Toronto.

shaft comes in which allows a gage of 4.24 in. to pass over it the shaft is scrapped. Standard bearings are thus 4½ in., 4.4 in., and 4.3 in. plus clearance.

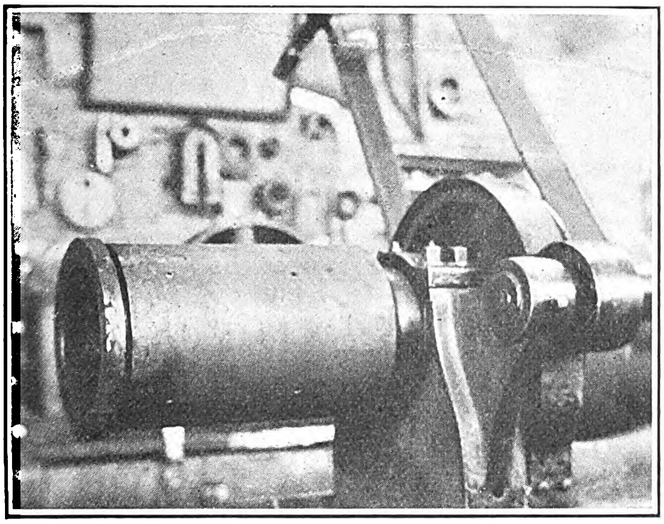
RUNNING CLEARANCES ALLOWED

The running clearances allowed for both armature and axle bearings was found to vary considerably on different properties. These are shown in Table I. As a guide to what is considered good practice by motor manufacturers the following is given:

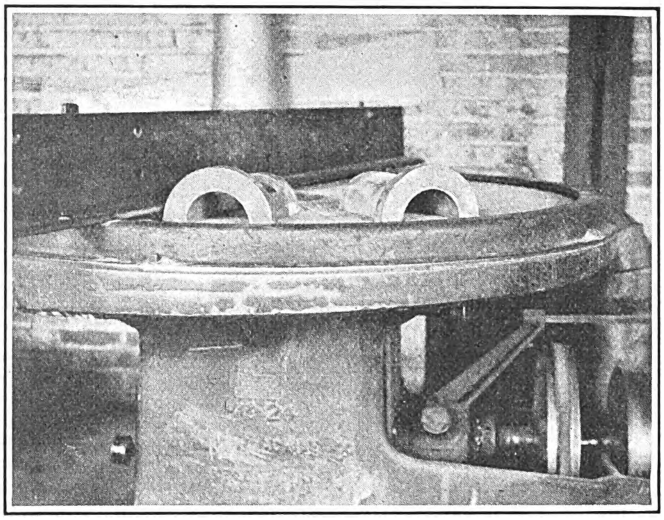
RECOMMENDED CLEARANCES FOR ARMATURE BEARINGS USING OIL AND WASTE LUBRICATION

Sizes	Clearance
2 in. up to 3 in.	0.006 in. to 0.008 in.
3 in. up to 4 in.	0.008 in. to 0.010 in.
4 in. up to 5 in.	0.010 in. to 0.014 in.
5 in. up to 6 in.	0.014 in. to 0.016 in.
6 in. up to 7 in.	0.016 in. to 0.018 in.

On the Illinois Traction System babbitted bearings are bored out 0.004 in. larger than the armature shaft fitted. Bronze shells are turned approximately 0.002 in. larger than the bore of the motor housing. When the bearings are pressed in, the interior bore is reduced in size to approximately 0.0025 in. larger than the shaft diameter.



Cylindrical Chuck for Holding Split-Axle Bearings While Being Bored and Machined in the Wheaton Shop of the Chicago, Aurora & Elgin Railroad



The Connecting Surfaces of Axle Bearings Are Finished on a Horizontal Grinder in the Shops of the Milwaukee Electric Railway & Light Company

The Youngstown Municipal Railway is now using a special form of nickel-bronze bearing. This was described in the Aug. 16 issue referred to at the beginning of this article, and clearances used were given.

Each of the two methods of fitting described above has its advantages and disadvantages. Where armature bearings are fitted directly to the shaft on which they are to be installed, the work must be done where the cars are inspected, except where a railway shop has only one operating carhouse, and this method requires the fitting of bearings by carhouse men who are usually not skilled machinists. This method also necessitates proper equipment at each carhouse to do this class of work. Longer service will be obtained if the bearings are fitted exactly to the shaft, but this work ordinarily can be done properly only in a machine shop with the correct tools and expert machinists.

The method of turning armature shafts to standard sizes and carrying the corresponding bearings in the storeroom to accommodate these diameters has the advantage that the machine work can be done efficiently, so as to obtain an accurate fit. Its disadvantage is that where the correct size of bearing is short or missing there is a tendency on the part of the carhouse men to use the next larger size, rather than to withhold the motor from service. One point brought out in this survey is that the man in the pit at the inspection shop is the one responsible person for the character of work done. Master mechanics and foremen issue instructions as to the methods to be followed, but pressure of work and the insistence that cars be returned to service promptly often lead the workmen to use their own judgment.

FITTING BEARINGS TO HOUSINGS

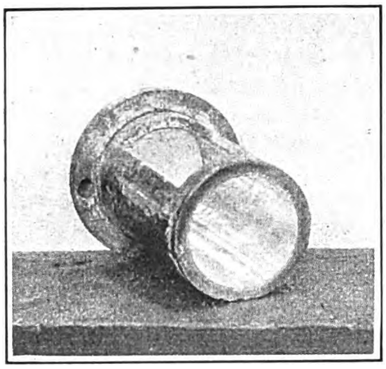
The finishing of the outside of armature and axle bearings is just as important as boring them out. Wear is sure to occur on the outside of the bearings and also in the housing fits or motor frames in case there is any looseness in the bolts which hold the bearings in place. Such looseness causes pounding, which not only shortens the life obtained from the bearing but allows the outer surface to rub against the housing and causes excessive wear between dowel pins and dowel holes or keys and keyways.

On most railways, while particular care is taken in the installation of armature bearings, axle bearings do not receive equally close attention. There is no air gap of which to take measurements, and there is no danger of excessive damage such as would result should an armature rub the pole faces. The wear on axle bearings, however, is really greater and the service is harder than on armature bearings. The hammer blows to the bearings are more severe since there are no springs between the axle and the track. These bearings are allowed to remain in service much longer than the motor designer would recommend, as information obtained clearly indicates. Just as much damage is done from excessive wear on axle bearings as on armature bearings when the lives of gears, pinions and armature windings are taken into consideration. Excessive clearance or loose fit in bearings causes the distance between centers to change so that the gear and pinion do not mesh properly and excessive tooth pressures result.

A number of different methods are used by various companies for machining the outsides of bearings. The precautions taken to insure tightness also vary. Some practices are given in the following paragraphs:

At the Wheaton shop of the Chicago, Aurora & Elgin Railroad the thrust flanges of both axle and armature bearings are built up by means of acetylene welding, ofttimes as much as ½ in. being added, after which the bearings are machined to exact size. The company states that this practice has been found satisfactory.

For machining split axle bearings, a sleeve chuck is used in an 18-in. engine lathe, with an interior bore that will accommodate the axle bearing. The chuck is of sufficient length so that the thrust flange will fit against its end. The bearing is held in position with eight pointed setscrews. The inside bore is finished and the thrust flange machined to smooth off the welded surface at one setting.



At the Decatur Shops of the Illinois Traction System Bronze Armature Bearings Are Finished on the Outside 0.002 In. Larger Than the Hole in the Housing.

Approximately 1/16 in. of babbitt is used on the inside and this is finished 0.004 in. larger than the diameter of the armature shaft. The shrinking of the bearing into its housing contracts the bore to approximately 0.0025 in.

SHIMS ARE NOT FAVORED

Several methods are used for obtaining a tight fit of the bearing in its housing or in the motor frame. The majority of the railways included in the survey do not favor shims or liners, although others are using them. The materials used for shims include canvas, cardboard, fiber and tin. A practice considered better by several of the railways is welding and boring out the housing or bearing fit. Metal is also frequently welded to the outsides of the bearings themselves. Reasons given for unsatisfactory results where shims are used are that the wear on the shells and bearings is uneven, and it is virtually impossible to shim a bearing so that the pressure between the two motor shells will be evenly distributed. With uneven wear on the bearing or its housing, the shims are always tight or pinching at the high spots, with a loose fit at low spots. Many railways do not spin their armatures with power or rotate them by hand after the motor is assembled, so that a tight fit on the shaft is not detected and hot bearings result.

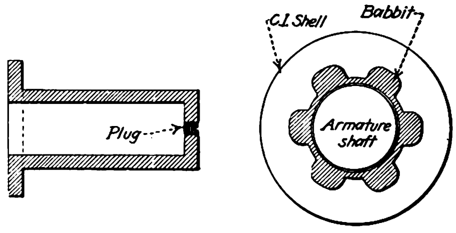
In Denver, shims are not used to hold bearings tight when the housing bores become worn. Due to a former practice of using unfinished bearing castings which were pressed into the housings, some of the housings have become excessively worn. These are now being welded and rebored. In the past, when metal shims were used to hold the armature bearings tight in the end housing, these would work loose and in some cases shift over the bearing windows and so restrict the flow of oil to the bearings. The present practice of welding and reboring has resulted in longer life of bearings.

In the shops of the Omaha & Council Bluffs Street Railway it is the practice to plane off the faces of the axle caps until the bearing is clamped tightly with the bolts drawn down. In order to determine the amount of metal which it is necessary to face off the practice is to drive a thin wedge under the bearing until it is tight in the housing and then to measure the thickness of wedge inserted. The amount of metal taken off the axle caps is 1/64 in. greater than this measurement, so that the bearing will be tight when the cap is drawn down.

When the armature bearing housings become worn, it is the practice to use over-sized castings for the bearing shells so that they will be tight. Under no circumstances are shims of any kind permitted.

Results obtained by railways which are welding and reboring their motor frames indicate that this practice merits careful consideration. The cost of welding and reboring runs from $18 to $25 per set of two armature and two axle bearing fits. Of course, the cost will vary, depending upon how well shops are equipped to handle this class of work. Several railways have motors which were originally designed for babbitt-lined cast-iron bearings, but in which bronze shells have been substituted. This requires an excessively thick bronze shell. With the practice of welding and reboring the diameter of the opening in the housing can be reduced so that a bronze bearing of standard thickness can be used. This reduces the cost for bearings considerably. In some cases the cost of welding and reboring is nearly compensated for by the decreased price of a set of bearings. On some railways the weight of the bearings has been reduced 50 to 60 per cent by the reduction of the fits in motor housings.

The practice of using heads to hold the bearings in the frame, as employed in the latest types of motors, overcomes part of the difficulty experienced with the split frame without heads. The same degree of care, however, should be exercised to keep these heads tight in the motor frames and also to keep the bearings tight in the heads, or else the same trouble in bearing fits will result as with the old type split-frame motors. In welding and boring a split-frame head, it is possible in many cases to use steel plates and weld these in place so that the amount of welding metal is reduced.



Two Types of Bearings Used in Denver

Armature bearing shells for GE-58 motors are cast solid at the end and finished with a screw plug to keep dirt and water from getting into the bearing. This is necessary because the narrow gage used subjects the motor to considerable wheel wash.

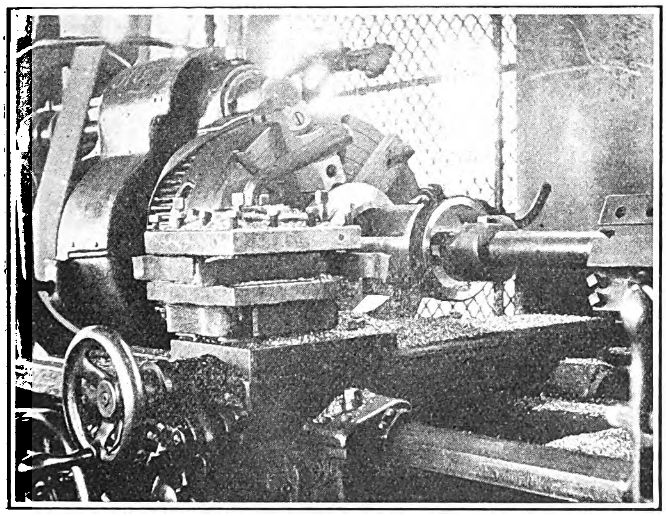
Cast-iron armature bearings are cored out so as to provide six lugs. These are bored out 1/16 in. over the armature shaft diameter. The thickness of babbitt over the lug is small enough so that there is no danger of the armature getting down on the pole faces.

A method of welding on steel rings to build up worn housings which has proved satisfactory consists of drilling out the worn tap-bolt holes and driving cast-iron plugs tightly into them. The worn housings are then turned down and a steel ring about ⅜ in. thick is shrunk on and welded. If the housing has a double flange, one of these must be cut off and a new flange made on the ring. The ring is then turned to insure a good tight clamping action of the two halves of the motor frame when bolted together. New holes are drilled and tapped in the housing through the shrunk-on ring into the cast-iron plugs to receive the bolts.

Some precautions recommended by motor manufacturers to keep housings on motors of the split-frame type from wearing are as follows: (1) Keep frame bolts and housing bolts drawn up tight; (2) see that lock washers are applied to all bolts; (3) use a good grade of heat-treated steel bolts; (4) remove all dirt at the split when assembling motors; (5) keep armature bearings in good condition; (6) inspect bolts regularly and systematically and keep them drawn up tight.

To keep the various parts of motors tight and with good clamping fits, the Westinghouse Electric & Manufacturing Company has given the following allowances:

On malleable-iron housings of box-frame motors an allowance for tight driving fits of 0.001 to 0.003 in. made on the housing is recommended. The bore of the frame at the fit should be from exact size to 0.002 in. under size. Keys are not used.



Split Bearings Are Clamped Together and Finished as One Unit on a Semi-Automatic High-Speed Lathe in the Shops of the Milwaukee Electric Railway & Light Company

Convenient Storage of Bearings After They Are Finished Assists Materially in Taking Care of Requirements in the Milwaukee Electric Railway & Light Company's Shops

With malleable-iron housings of split-frame motors an allowance for a clamp fit is provided in the housing seat on the motor frame. It is recommended that the housing seat be machined to exact size with single liners 0.017 in. thick placed at the split of the two halves of the frame.

For armature bearing shells of malleable iron or bronze in box and split-frame motors with housings, an allowance for a press fit is recommended of 0.002 to 0.004 in. made on the bearing shell. The average pressure for pressing in should be from 3 to 5 tons at the commutator end and from 5 to 8 tons at the pinion end.

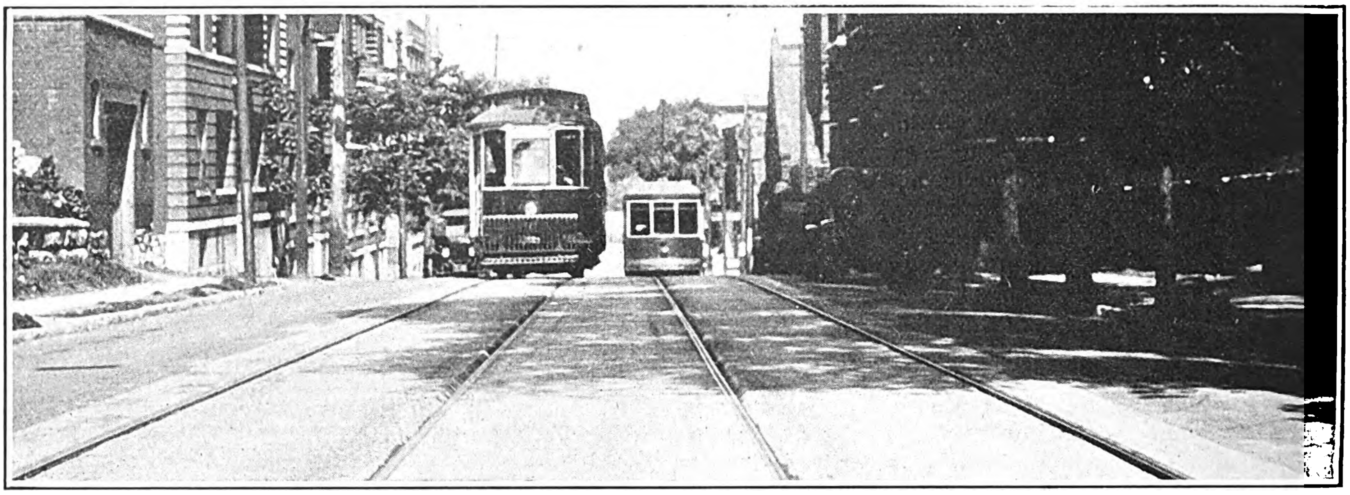
Malleable-iron and bronze armature bearings in split-frame motors without housings should have an allowance for a clamp fit provided in the bearing seat on the frame of the motor. As already stated, this should be provided by the insertion of 0.017-in. liners while the seat is being machined. This same method should be followed for axle bearings of malleable iron or bronze.

In connection with any of the preceding work it is important to have the surfaces that are fitted together machined and gaged accurately. The fitted surfaces should be given a smooth finish, since a rough surface provides a poor contact. When keys or dowels are used they should be held tightly in one of the pieces and be given the minimum practical clearance in the other part. In pressing two pieces together it is advisable to use a lubricant, such as white lead mixed with lard oil or machine oil, on the surface of the fit, and to get a true alignment at the start.

Axles with enlarged wheel and gear seats have fillets at the changes in diameter. The ends of axle bearings should be rounded off accordingly. The practice on the majority of railways is to make the radius of the rounded portion on the axle bearing larger than the radius of the fillet on the axle itself. This insures that the bearing can go into place properly, without danger of binding on the fillet. Several railways obtain the same result by cutting a chamfer off the inside edge at the flange end. This is easier to machine.

Other points which are given attention in the machining of bearings by a majority of electric railways consist of chamfering the inside edges of waste openings or windows and the edges of oil grooves. Of the 20 railways covered in this survey all but three were using oil grooves in their bearings. In most cases these are either machined or are cut with a chisel. A few, however, are molded into the lining. Six different arrangements of oil grooves were found on the railway properties visited, as given in the accompanying illustrations. All of these have at least one oil groove leading to the flanged end of the bearing. This is the hardest point to keep lubricated, and probably most hot bearings start from heating there. An important point in the location of oil grooves is to make certain that the inside ends of the groove start from the chamfered portion of the window. With this arrangement the chamfered portion forms a trough in which oil accumulates and thus feeds to the groove. On the railways which do not use oil grooves to the outer end of the bearing, reasons given for the omission of grooves at this end are that the window is so close to the outer end that grooves are unnecessary.

The amount of end-play allowed for armatures when bearings are fitted was found to vary from $\frac{1}{32}$ in. to $\frac{1}{4}$ in. The practice used by the various railways is given in Table I.



A Typical Example of Solid Concrete Track Construction with Concrete Paving in Kansas City

Rigid Track Experience in Kansas City

Approximately 46 Miles of Track Has Been Built in Solid Concrete with Various Types of Paving—Both Wood Ties and Steel Ties Have Been Used—Thermit Joints Have Stood Up Well

By A. E. Harvey

Superintendent Way and Structures, Kansas City Railways

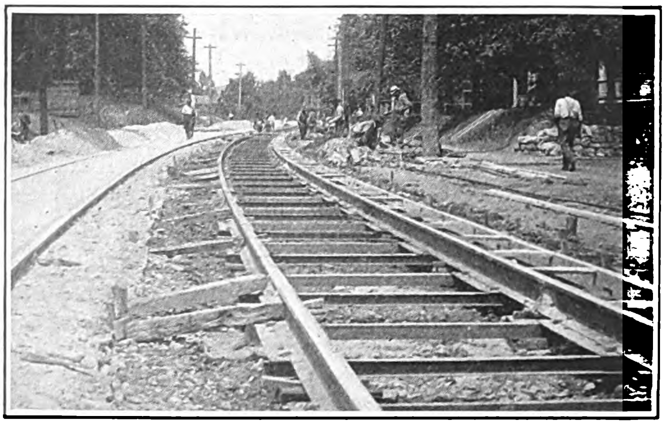
DURING the past twelve years there has been constructed in Kansas City 242,230 ft., or approximately 46 miles, of track in solid concrete. This work has been done with various kinds of paving, and at the present time the greater part of the track is in first-class condition. Trouble has been experienced with certain types of welded joints and some wood block paving has proved to be unsatisfactory. The track structure in general, however, has stood up well and no serious rail corrugation has developed. The experience of this company indicates that the noise produced by the passage of cars is due more to the condition of equipment than to the nature of the track structure.

Disintegration of the pavement along the rail led the Kansas City Railways some time ago to undertake rather extensive experiments with various methods of building track. The independent movement of the parts of a flexible structure was believed to create openings into which water entered, so that it destroyed the track foundation. In an attempt to eliminate this action track was built on a concrete base in such a way that the completed structure was practically rigid.

At first the track was built with a solid concrete base and a cushion of sand under the ties. Although this design remedied all the defects occurring in the subgrade, it was sufficiently flexible to permit independent movement of the rail and pavement. Another design was tried, therefore, in which the ties and base of the rail were entirely inclosed in concrete up to the base of the paving material. This type of track structure gave good results, but it was necessary to excavate to a considerable depth under the wood ties in order to give the concrete slab sufficient strength.

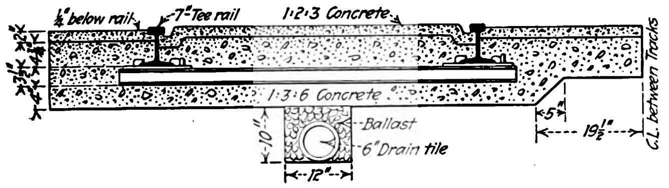
It was thought on this account that there might be advantages in a type of construction wherein substitute ties of shallow depth were used. This would permit a minimum amount of excavation and the ties and the rails would act as reinforcing bars for the concrete. It was hoped that this design would largely eliminate the independent movement of the rail and pavement. Several kinds of substitute ties have been tried and in general they have produced good results.

Tamping Concrete Under the Ties as It Takes Its Initial Set



Type of Track Structure Used in Kansas City with Substitute Ties

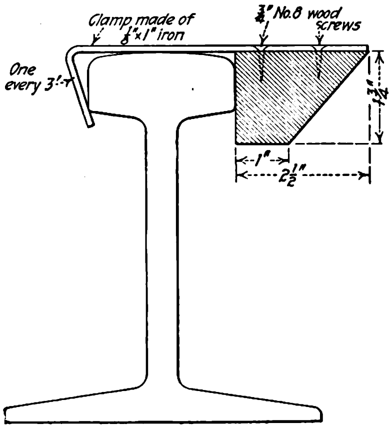
Solid concrete construction was first used in 1913, when about 36,900 ft. of track was built, using white oak ties, 7-in. T-rail, with thermit joints and granite block paving. At the present time, this track is in almost perfect condition and practically no money has been spent on it for repairs. The following year 4,260 ft. of track was constructed, using 100-lb. A.S.C.E. rail, Carnegie steel ties, bolted joints and various types of paving. Today the base, ties and general track structure are still in good condition, but some repairs to the bolted joints have been necessary, and the wood block paving deteriorated badly in places.



Where Concrete Paving Is Used the Concrete Is Poured in Two Courses

During several following years wood ties were again used. This construction has stood up as well as the track built in 1913. In 1918 5,690 ft. of single track was constructed in solid concrete, with Carnegie steel ties, concrete paving and 80-lb. A.S.C.E. rail. No repairs have been made up to the present time on this track. In 1920 the use of International steel twin ties was begun, and since that time 35,100 ft. of single track has been constructed in this way. The results that have been obtained both in the matter of cost and in the quality of the work have been satisfactory. In general, the cost of the material is greater for the steel tie structure and the cost of labor somewhat less. This is due to the fact that steel ties are considerably easier to handle and the track can be brought to gage with less effort.

Where concrete paving is used the concrete is placed in two courses. The base course is placed first and the concrete thoroughly tamped under the rail and ties as it takes its initial set. Immediately thereafter a second or finish course containing a richer mixture is placed by a second gang of workmen and a second concrete mixer. This is done at once, in order that the concrete may set in a single mass without a seam. When T-rail is used flangeways are provided by the use of wood forms. These are of pine or cypress and are made in 12-ft. lengths. The design is shown above.



A Wooden Form of This Shape Is Used to Make the Flangeways

Experience with monolithic concrete construction in Kansas City shows that little damage occurs through expansion of the rail and very few cracks occur in the concrete surface. Paving of other types has been found, in fact, to be more subject to this trouble than is concrete paving. The absence of trouble from this source may be due to the fact that the concrete and steel have very nearly the same coefficient of expansion.

Keeping Cars Clean in the Twin Cities

Regular Reports, Systematic Routine and Continual Vigilance Found to Be the Secret of Obtaining Uniformly Good Results

THAT clean, well-painted, fresh-looking cars are an important element in keeping car riders pleased with the service rendered by the street railway company has come to be accepted by most progressive operators. It has also been demonstrated that money invested in paint and scrub brushes is at most a very small part of the total cost of maintenance of equipment, but represents one of the most effective methods of obtaining favorable publicity.

In the Twin Cities, systematic effort and continual vigilance have been found by the mechanical department to be the two most effective factors in keeping cars in this desirable condition. This kind of work requires supervision by a comparatively rare type of man—one who has the ability to organize his work for efficiency and who, at the same time, has sufficient imagination to maintain an enthusiastic attitude toward a type of work which is performed with common labor and which is sometimes looked on by mechanical men as being a necessary nuisance. It is needless to say that it also requires interest, enthusiasm and continual vigilance on the part of general executives to keep such a man pitched up to a key of interest that will produce consistently good results.

Careful analysis of various methods of carrying out the work of car cleaning and washing have led to the subdivision of this work, so that each car is kept at all times in the best possible condition consistent with reasonable cost. This subdivision of cleaning activity includes the following operations: Sweeping, dusting, scrubbing, washing and general car cleaning.

A total of 850 cars are in service on the lines of this company. During the month of June, 28,806 cars were swept. This includes sprinkling sweeping compound over the floor, sweeping this out thoroughly, and spraying the interior of the car with disinfectant. Eighteen men are engaged in this work, and the average time per car is approximately 8.66 minutes. It is evident that the total number of cars gone over per month is equivalent to sweeping each of the 850 cars practically 34 times per month, or a little more than once per day.

Dusting consists of thoroughly wiping seats, shades, windows and the other interior parts of the car, to remove interior dust. Twenty-two men are engaged in this work, and the average time per car is 31 minutes. During the month of June, 7,749 cars were gone over in this way, which is equivalent to dusting each car on the system nine times during the month, or a little better than twice per week.

Five men are engaged in the work of scrubbing floors. Thorough cleanliness is considered the best form of sanitation, and is superior to the use of large quantities of disinfectants. The practice in scrubbing cars, therefore, is to give the oak floors a thorough old-fashioned hand and knee scrubbing, as a housewife would scrub the floors of her home. During the month of June, 1,073 cars were so scrubbed, in an average time of 59 minutes per car. This is equivalent to going over each car about 1¼ times per month.

When a car is washed, the outside is gone over thoroughly with lukewarm water and long-handled brushes. If the car is unusually dirty, as is sometimes the case after protracted periods of bad weather, a weak soap solution is applied first, and is then rinsed off with clean water. Pails and brushes are used for car washing in preference to spraying methods, due first to the flexibility and simplicity of this method which eliminates an excessive amount of car shifting, and also to the economy in the use of water. During the month of June, 8,104 cars were washed by 16 men, in an average time of 22½ minutes per car. The total number of cars gone over is equivalent to washing each car 9½ times per month.

When a car is given a general car cleaning, it is gone over both inside and out. Ceilings, curtains, windows, floors and exterior are thoroughly washed and scrubbed when necessary. Oxalic acid is used to remove tenacious dirt on painted surfaces. The time spent on a car is 12.07 hours, and when it is completed all dirt has been removed from corners as well as from those parts that show more conspicuously. During the month of June, 261 cars were cleaned in this way. This is equivalent to putting each car through this process approximately once every three months. There are thirteen men engaged in this work.

Systematic reports by the man in charge of car cleaning to the head of the mechanical department form the basis of following up this work. These reports are made up in detail, so that the head of the department can tell at a glance whether any part of the work is being allowed to lag, or whether the efficiency of the men doing the work is being allowed to fall off. It is only by virtue of continual interest on the part of the department head that this work can be kept from lagging either in thoroughness or volume. Total labor costs for car cleaning in the Twin Cities average approximately $2.75 per thousand car-miles. It is part of the price of keeping patrons pleased with the car service, and reductions in expenditures for this purpose represent poor economy from the standpoint of the company's relations with its patrons.

Corrosive Effect of Slag

Detroit Investigation Shows 54 per Cent of Base of Rails Eaten Away in 21 Years

By W. R. Dunham
Executive Engineer Department of Street Railways, City of Detroit

The effect of slag on a rail section is brought out very clearly in the illustration accompanying this article. Not only is the corrosion shown but some light is thrown on the difference between wear on the head of the rail due to traffic and what has actually occurred, or the apparent wear which would be indicated from an inspection of the head surface only.

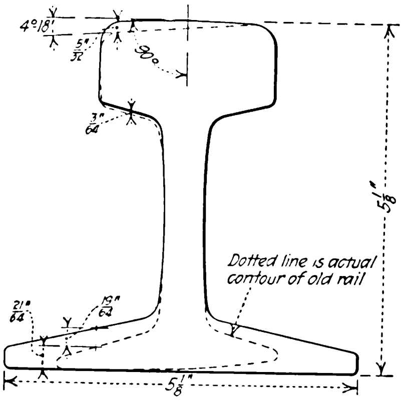
The sketches are from an actual section cut from the rail after its removal from the track. The rail, an 85-lb. A.S.C.E., was laid in 1903 and removed early in 1924. The track area from the top of the ties was back-filled to the head of the rail with furnace slag.

The accompanying table gives under "New Section" the areas in square inches and per cent of metal in the head, web and base and is taken from a steel company handbook. The areas and percentages given under "Worn Section" are for the section as shown by dotted lines, the areas being derived by planimeter. The last column in the table gives the losses in per cent of the different rail parts from corrosion. It will be noted that there has been an apparent gain in the web area. This is due to the increased length of the fishing section on account of the corrosion on the base.

DISTRIBUTION OF METAL OF RAIL SECTIONS NEW AND AFTER 21 YEARS IN THE TRACK

	New Section		Worn Section		Worn Section
Rail Part	Area in Square Inches	Area in Per Cent of Total	Area in Square Inches	Area in Per Cent of Total	Per Cent Change in Area
Head	3.50	42	3.25	50	7.1—
Web	1.75	21	1.85	28	5.7+
Base	3.05	37	1.40	22	54.0—
Total	8.30	100	6.50	100	21.7—

It is interesting to note that, under traffic, the head and web on the gage side have bent down and in toward the center line of the track respectively. Had the wear of this rail been measured from the surface, it would have indicated a total wear of 5/32 in., or 0.0372 in. wear per 5-year period. It will be noticed, however, that nearly half of this amount is due to a vertical bending of the head. The actual wear, therefore, is but 0.0260 in. or 69.9 per cent of the surface indication per 5-year period. It would be interesting to know how many of the rails on which the wear is measured from time to time in connection with the question of renewal for wear have this same feature, so that no differentiation has been made between the actual abrasion and the abrasion plus the bend in the head and web.



Original and Final Section of Rail Laid in Slag, Detroit

Photomicrographs of the head were also made in order to determine the reduction in height due to cold rolling. While the effect of the cold rolling was shown, the amount of this reduction was negligible in so far as measuring for loss of head surface due to wear.

The apparent surface wear of a rail head as indicated by an inspection of the surface only was really made up of three things: Abrasion, compression of the metal from the wheel passing over it and the depression of the head through the bending of the web from the loadings carried.

As cinders and slag have been recommended for ballast, this article is pertinent in showing the effect of slag on rails in contact therewith.

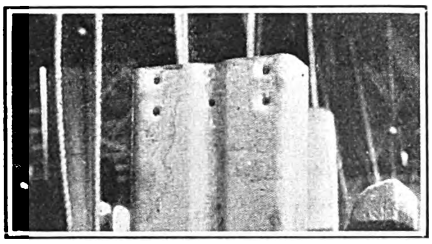
In an article appearing some time ago in the Electric Railway Journal, giving an improved method of placing concrete under steel ties in new track construction as worked out by the Cleveland Railway, the method used was described as follows: ". . . the material used being as mix of slag screenings and cement." This mixture was tamped under the steel tie plate and in intimate contact with both the steel tie plate and the steel channels composing the tie. It is presumed that after the tie fails from corrosion, this failure will be used as an argument against substitute ties, while the practice of using slag ballast against steel rails will be continued.

The rail section from which these sketches were made was of great interest to the writer, and it is hoped that this article will be of interest to way engineers generally.

Equipment Maintenance Notes

Drop Punch for Thin Material

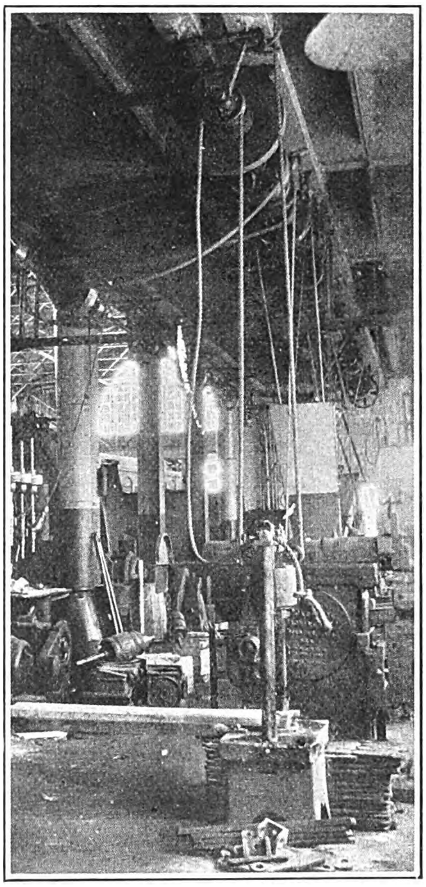
THE pantograph shoes used by the New York, Westchester & Boston Railway require five holes in each end. The holes are ¼ in. in diameter with ¾-in. countersinks, and the pantograph shoes are made of No. 14 gage blue annealed steel. The four outside holes are used for screwing the shoe in place, and the center hole, which comes in the groove of the shoe, is an oil hole.



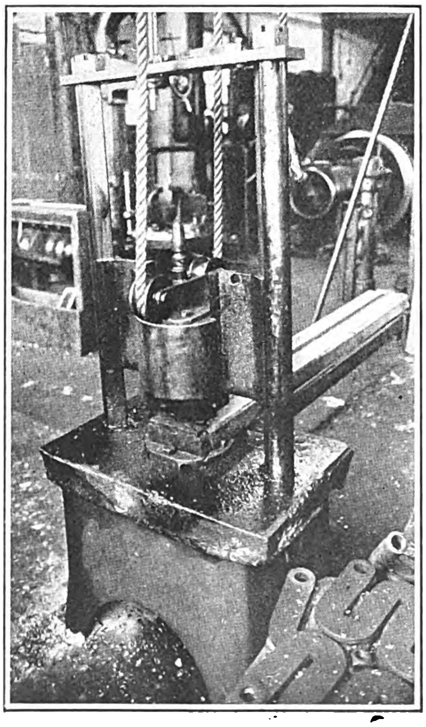
End of Contact Shoe Showing Holes as Punched

A shop-made drop punch has been constructed for punching all five holes in one operation. The bed of the punch is a discarded anvil base the top of which is about 15 in. above the floor. Into this are fastened the two upright guides which were 2½-in. steel shafts. The inner sides of these guides have been planed off to a V shape and the punch weights, together with the removable head for holding the punches, slide up and down between them. The drop weight is a piece of an old 8-in. axle and weighs approximately 125 lb. The weight can drop 18 in. from the raised position. A removable die fits into the bedplate. The drop weight is provided with a top stud extension so that with the weight raised this stud passes through the top support and a spring safety catch fits into a groove of the stud and automatically locks the weight in position. To release the weight a lever is pushed inward, forcing the spring catch out of the groove in the stud. When the machine is not in operation a pin is inserted back of the safety catch to lock it permanently.

The method of raising the weight preparatory to dropping is novel. A ¾-in. rope with one end attached to an overhead support passes downward and through two 2-in. sheaves mounted on top of the drop weight, from where it again passes to a 6-in. sheave mounted on a short shaft overhead. The free end is used by the operator to tighten the rope and thus lift the weight. An 18-in. pulley on the overhead shaft is driven from the shop countershaft. By pulling on the loose end of the rope, the sheave on the countershaft raises the weight until it is automatically locked, so that no effort is required of the operator. In order to drop the weight for punching the safety catch is released.



Rope and Sheave Arrangement for Raising the Punch Weight



Pantograph Shoe in Position After the Punch Weight Has Dropped

An extension arm made of ½-in. x 1½-in. bar steel holds the pantograph shoe in position while it is being punched. With the full drop of 18 in. the holes are punched at one operation. A drop of half this height is used to make the countersinks. The base has a double groove underneath, so that the punchings are fed out of these grooves and one punching pushes the one ahead, so that it is self-cleaning.

Pull-Ins Reduced

THE report of the Electric Railway Association of Equipment Men, Southern Properties, for the first nine months of 1924 shows an

COMPARATIVE STATEMENT OF CAR PULL-INS

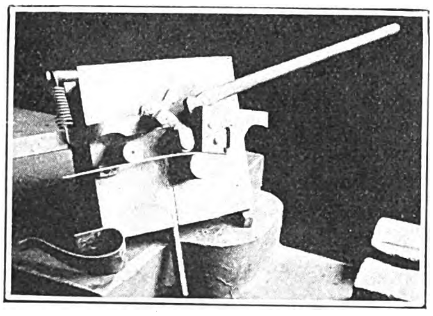
average car mileage per chargeable pull-in of 121,919 at New Orleans as against 110,653 miles for the first five months, as mentioned in ELECTRIC RAILWAY JOURNAL for July 19, page 91. The railways in Nashville, Memphis, Knoxville, Birmingham, Atlanta and Dallas all showed similar improvement. Nashville was again second to the leader, New Orleans, but Memphis was in third place at the end of September, Little Rock having lost that distinction. Figures of the individual companies for the month and for nine months also are given in the accompanying table.

Die for Making Journal Box Cover Springs

DUE to the fact that the cost of the special springs used on journal box covers by the Twin City Rapid Transit Company was high, particularly when they were purchased in comparatively small quantities, the mechanical department of the company found it desirable to make these springs in its own shop.



Journal Box Cover Springs Are Formed at the Rate of 100 per Hour by One Man Using This Ingenious Die that was Developed in the Twin City Rapid Transit Company's Shop

At first these were made by hand at a cost of approximately 18 cents each. Later, however, a special die of the type shown in the accompanying illustration was made up, and through its use it became possible to make these springs at a cost which is about 40 per cent of that of the hand method.

The spring is tapered throughout its length and is formed into a reverse curve of fairly complicated shape.

At one end these springs are 3 in. wide, and taper from that to 1 in. at the narrow end. Stock is purchased ⅛ in. x 4 in. and is cut up into pieces 12½ in. long, which is the proper length for making the spring. This material is split diagonally and the hole punched in one end. The entire forming operation is then carried out on the die.

A blank for one of the springs is shown in position in the die, for the beginning of the forming operation. At the right is the operating handle. In the position shown, this handle has just been pulled down so as to disengage the latch shown at the top of the die. This action allows the roller shown in contact with the blank to descend into place under the action of the helical spring fastened to the lever projecting to the left from the die. In the position shown for the operating handle, the jaw in the die block grips the right end of the spring blank. Above this position of the operating handle this jaw is released, and when the handle engages the latch at the top the roller is also lifted out of position against the action of the spring at the left.

To form the spring the operating handle is swung through slightly more than a semicircle, in a clockwise direction. When this is done the roller holds the blank firmly against the die block which is formed to the proper shape for the completed spring, and as the jaw in the block holds one end of the blank the latter is formed to the shape of the block as the latter is revolved with the handle. As the block nears the end of its cycle the reverse curve in the end of the spring is formed by the die as it presses the blank against the round plug shown just under the roller spring lever.

When the spring has been formed the handle is rotated back until it engages the roller release latch, at which time the jaw in the die is also released. The short lever shown projecting below the die is then used to eject the finished spring.

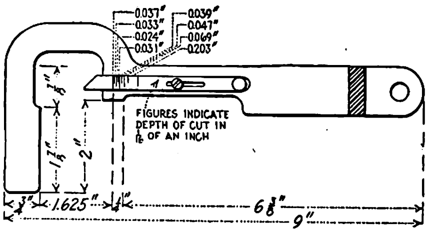
This tool is operated in connection with an oil heating furnace by one man. With this equipment he can heat and form aproximately 100 springs per hour.

Flange Gage for Wheel Turning

IN THE shops of the Department of Street Railways, city of Detroit, the special type of gage shown in the accompanying illustration was developed for facilitating the work of turning flanges of rolled-steel wheels.

This gage was designed and made in the shop. It enables a workman to determine the depth of cut required to bring a flange back to the proper dimensions. A graduated slide shows directly in fractions of an inch the depth of cut required.

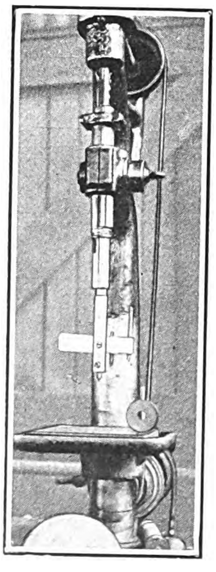
The slide is mounted in the gage so that it comes in contact with the wheel at the proper gage line. When an old pair of wheels is set up in the lathe for turning the gage is slipped over the flange, the slide is moved forward until it comes in contact with the wheel and the amount of metal to be taken off is read directly from the scale. Thus a saving is made not only in the time required for the turning operation but also in the amount of metal taken off the wheel. This prolongs the total useful life of each wheel.



Adjustable Gage for Wheel Flanges

Cutting Magnet Coil Tops

A TOOL has been designed and made in the Decatur shops of the Illinois Traction System for rapidly cutting magnet coil tops out of red fiber without an excessive waste of material. The tool, in appearance, resembles an expansion bit without the intervening cutting blade between the centering point and the outside cutting edge. It has a tapered shank and fits into the customary ⅜-in. taper chuck on the drill press. At its lower end an adjustable cross member, held in place by a setscrew, carries two tool-steel cutting bits. These bits are of quarter-inch round steel ground to a thin cutting point. The cutting end is 1/16 in. wide and ⅜ in. long. The bits are held in place by setscrews in the cross member. The distance between the two cutting tools is approximately 1 in. It is not the practice to cut



Device for Drilling Out Magnet Coils

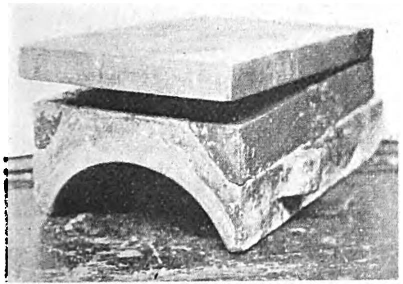
Magnet coil tops are drilled from ¼-in. red fiber insulation material by means of an adjustable cutting tool which fits into a small drill press.

both the inside circle and the outside circle at one operation. Two bits are available in order to expedite the work of cutting both small and large size tops. The red fiber insulating material, which is usually ¼ in. thick, is clamped to the drill press table and after a centering hole has been drilled the tool is brought down upon the fiber in the same manner as in drilling.

Modified M. C. B. Journal Brass

A MODIFIED form of M.C.B. journal brass is used on the high-speed cars of the Chicago, Aurora & Elgin Railroad with good results. The standard M.C.B. journal has beveled corners, and the journal wedge the necessary extensions to fill the space. This type of journal is liable to side oscillation. As a result of the frequent starts and stops of an electric car, brasses are worn out quickly.

The changes in design inaugurated by the shop engineers of this railway include the filling up of the beveled corners on the brass and the elimination of the triangular lugs on the wedge to give a brass with a flat top and a corresponding flat wedge. The construction does away with all journal box oscillation, and gives a longer life to the brass. The redesigned wedge, which can be machined entirely with a shaper, is a flat piece of steel with one surface tapered 1/16 in. in both directions from the ends to the center. This taper allows for a longitudinal oscillation and centering of the brass upon the axle.

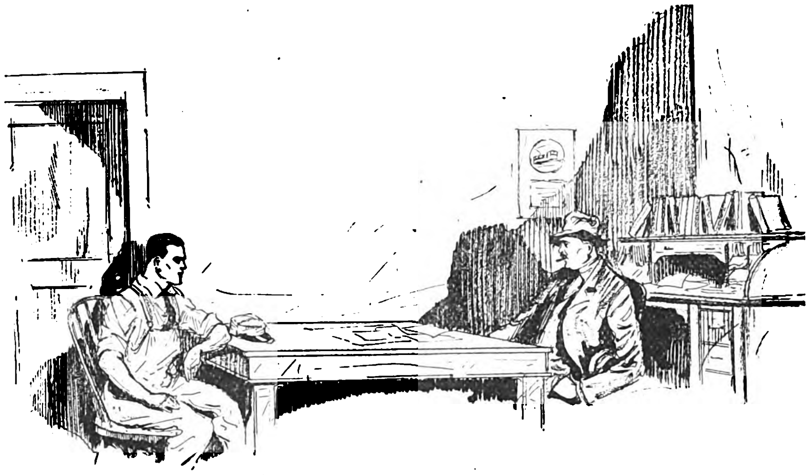


M.C.B. Journal Brass and Wedge Modified to Prolong Their Life

All old journal brasses are built up at the corners by welding on steel pieces, as shown in the illustration. New journal brasses are made according to the modified design. The new type of wedge will operate with either the old or the new designs of brasses.

Dick Prescott's Opportunity

It Finds Him Ready



DICK PRESCOTT felt somewhat uneasy as he knocked on the door of Thomas Mullaney's office. A morning summons from the general foreman was generally considered among the shop employees of the Consolidated Railway & Light Company as an incident boding no good results. Despite his uneasiness, Dick had himself well in hand as he opened the heavy door at the gruff invitation from the interior of the sanctum. The self-confidence generated by habitual sincerity of thought and speech, combined with the consciousness of having made a whole-hearted endeavor to be as useful as possible under the circumstances in which he found himself, gave Dick that feeling of having "played the game" which caused him now to face any eventuality with confidence.

As he opened the door, his eyes sought those of the general foreman in mild inquiry. He was agreeably surprised and relieved by what he saw there. A faint twinkle that he had never noticed before gave him the feeling of one who, upon pulling aside a dusty and forbidding curtain, discovers beyond a cheerful and inviting interior. Dick suddenly realized that all of Thomas Mullaney's "hard-boiled" exterior was merely a cloak which had come about him through many years of routine adherence to precedent, and that the man within was warmly human and likable. He accepted the gruff invitation to be seated with mixed feelings of admiration, respect and sympathy for this crusty old veteran who had kept things going along with a fair degree of efficiency through many changes in conditions and deficiencies in management.

Mullaney got into his subject quickly and in his blunt manner outlined the purpose of the interview. He offered Dick the opportunity of organizing an engineering department in the shop and suggested that if Dick felt able to tackle the job he would ask the general manager to send him and one of the foremen on an extended trip to gather ideas from other properties. It was evident that Mullaney had at last recognized in Mr. Milburn, the new general manager, an executive with vision and courage, and realized that the new era which was dawning on the property called for young blood and new ideas.

After outlining his proposal briefly, Mullaney shifted the inevitable cigar stub to the other side of his mouth and leaned back in his weatherbeaten old chair with a kindly smile at the eager boy across the table.

"Well, what d'you think about it? Believe you could handle that job?"

"I think I could, Mr. Mullaney. I've spent practically all my spare time for some years in railway shops, and also worked for two years when I had to drop out of school because of lack of funds. I've been keeping my eyes open here, and though I'd have to take things slowly at first, I believe I can see a real opportunity for co-ordinating an engineering department with all of the other shop activities from construction to handling of materials, so as to make it a real agency for cutting down lost motion, improving methods and increasing efficiency.

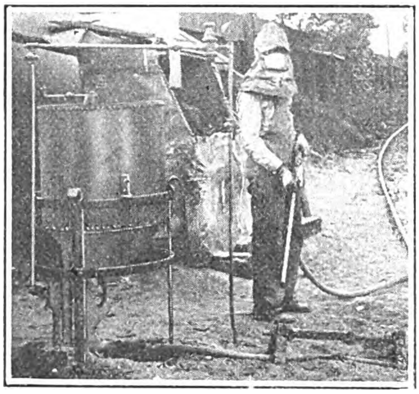
"Your suggestion for a trip to other properties is fine. I'm pretty well acquainted with many of the practices in other shops, as I have been studying the files of the ELECTRIC RAILWAY JOURNAL ever since I came here, and in that way have compared many of our methods with those of other roads. Such a trip would give me some definite ideas as to just how we can get an engineering department under way, so that each foreman will understand that first of all its purpose is to make it easier for the various shop departments to do better work."

"All right, my boy, you've got the idea exactly. You're pretty young, but I think you can handle this thing if you keep your feet on the ground. Get yourself ready to leave next Monday and I'll talk to you again before the end of the week. Now go tell Steve White that I want to see him right away."

As Dick stepped out of the office he was filled with mingled emotions of joy and impending responsibility, but the former took precedence to such an extent that he literally had difficulty in keeping his feet on the ground as he hastened in search of Steve.

Sand Blast Used for Many Purposes

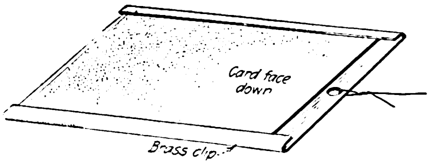
IN THE shops of the Kansas City Railways a sand-blasting equipment has proved useful for many purposes in connection with car overhaul and repair work. On most repair and overhaul jobs men will do better work if the parts are cleaned when they are taken off the cars. Consequently, in addition to its use for cleaning the sides of steel cars, the sand-blast outfit illustrated is used to clean truck frames, parts of door and step mechanism, miscellaneous castings, dash-iron plates, etc. Cleaning such parts makes them easier to handle, and at the same time improves the character of work that is done during repair or overhaul. It also has been found that by thus thoroughly cleaning up the surface of castings and similar parts, defects, cracks and blow-holes are shown up which might otherwise go undiscovered.



By Cleaning Car and Truck Parts with This Sand-Blast Outfit Better Workmanship Is Obtained at Kansas City

Simple Tag Holders

IN MOVING materials between carhouses and shops it is usually necessary to employ some type of tag for indicating the proper destination and other information regarding the material handled. In the shops of the Department of Street Railways, city of Detroit, a very simple type of holder has been devised to prevent the mutilation of these tags as they are handled at various points on the system. This holder consists of a flat piece of brass with two edges folded over so as to form clips for the tag. The two folded edges are cut back at an angle at the corners to allow the card to be inserted readily. The card is put in with its face toward the brass clip, thus preventing the instructions from becoming obliterated (in the handling. A piece of flexible wire through a hole in the holder and the card holds the latter securely in place and also serves to fasten the holder to the box or package in which the materials are packed. This simple device is shown in an accompanying illustration.



Brass Tag Holder Used by Department of Street Railways, Detroit

New Equipment Available

Double-Deck Six-Wheel Buses for Los Angeles

WHAT is said to be the first double-deck six-wheel bus to be used either in this country or abroad was recently placed in service by the Los Angeles Railway. This vehicle is built by the Moreland Motor Truck Company, and it is claimed that the six-wheel construction permits the use of pneumatic tires on the rear wheels. This could not be done with a four-wheel double-deck bus, because of the excessive weight on each wheel.

The construction used is of the Goodyear type, where each axle is attached to a strong semi-elliptic spring hinged in the center. By using this type of suspension, each of the four rear wheels may be raised or lowered to a degree greater than is possible with the ordinary four-wheel construction without raising the body.

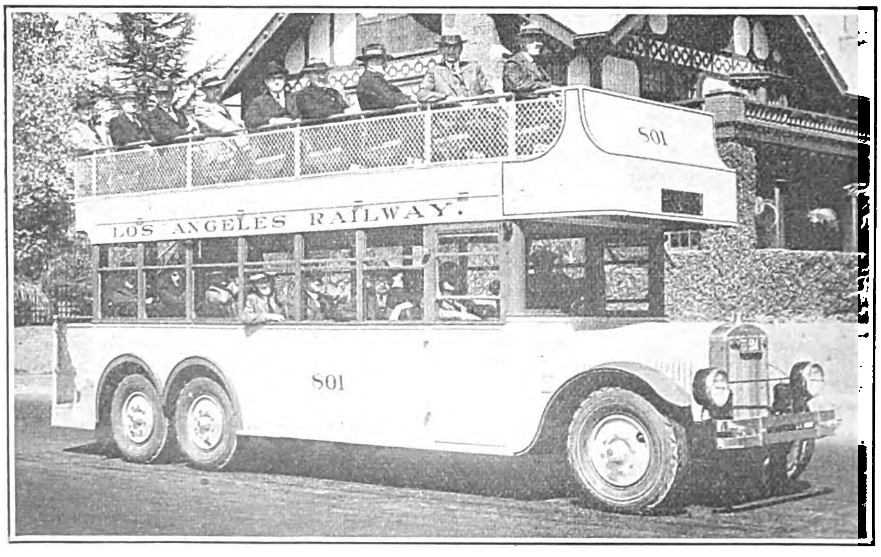
With this design the center of the spring to which the frame is attached moves up only one-half the amount which the wheel moves. Braking is effected on all six-wheels by a combination air-hydraulic system. The sides of the bus are made of Plymetl, and the roof is of Haskelite.

Light-Weight Harp

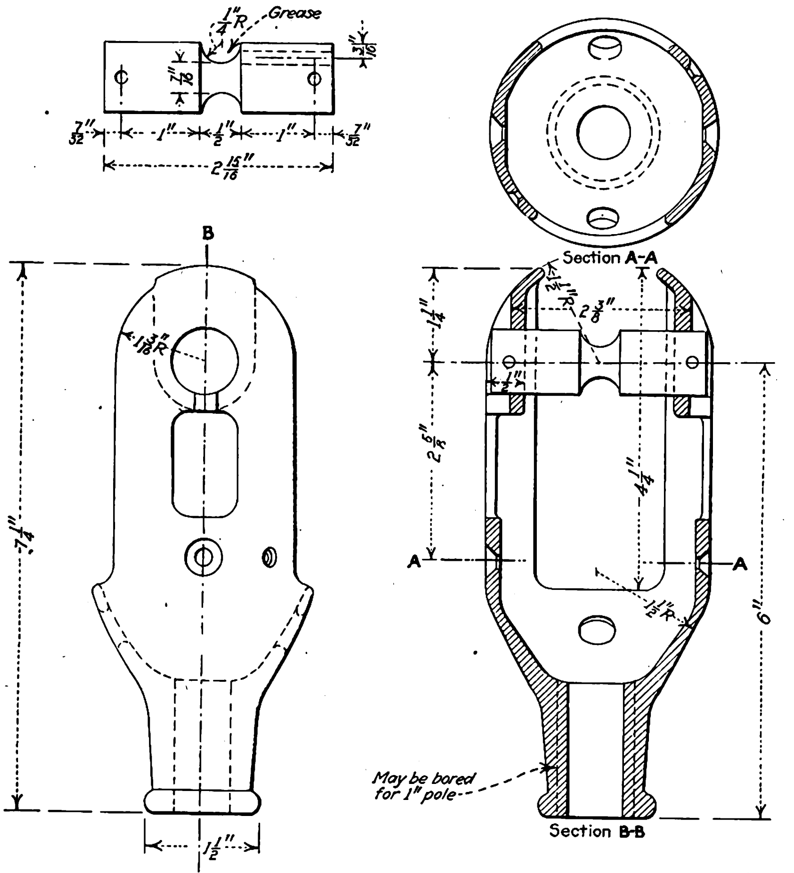
A TROLLEY HARP with increased strength but of light construction is being introduced by the R. D. Nuttall Company, Pittsburgh, Pa. The arms of the harp are rounded on the outside, and their ends have a spherical contour. There are no ribs or other projections, leaving no sharp edges or corners to catch in the overhead wires in case the wheel leaves the wire. All screws and rivet heads come flush with the outside surface, while the axle pins and cotter pins are kept within the outside contour. The weight of the harp and wheel is 6 lb.

Contact washers may be used inside but the contact spring is arranged to bear directly on the wheel hub so that contact washers are not necessary. Contact springs are readily replaced when worn by a slight turn on the clamping screw, which releases the contact spring so that it can easily be withdrawn.

An improved type of axle pin is



Pneumatic Tires Can Be Used on This Double-Deck Bus, Because the Six-Wheel Construction Reduces the Load on Each of the Rear Wheels



A Trolley Harp that Will Not Catch in the Overhead

also a part of the new device. Grease is forced through a hole in the pin which communicates to a large annular groove on the outside, bringing the lubricant in direct contact with the base of the wheel.

Inclosed Coil Heater

A CAR heater is being placed on the market by the Railway Utility Company of Chicago which embodies several interesting new features of design and construction.

The heater unit itself is of the inclosed type, using a resistor of nickel-chromium ribbon, corrugated or reflexed in a refractory insulating material which it is claimed does not deteriorate from the action of sudden high temperatures. This is said to give a unit which will stand the extreme voltage variations encountered in railway work, including extreme over-voltages for quite lengthy periods of time.

A novel feature of the case construction is the provision of a ventilating flue in the back where it is placed against the side of the car and at the top where it would come in contact with passengers. In the panel-type case, which is usually installed under longitudinal seats, this feature is for the purpose of preventing radiation of the heat generated by the unit to the space under the cushions. In the vestibule and truss-plank heaters, this flue feature is said to prevent radiation through the sides or ends of the car.

It is claimed that the flue action is so effective that increased temperature of the elements actually results in decreased temperature of the top and back of the case. This flue construction also makes it permissible to install these heaters without placing fire resisting material behind them.

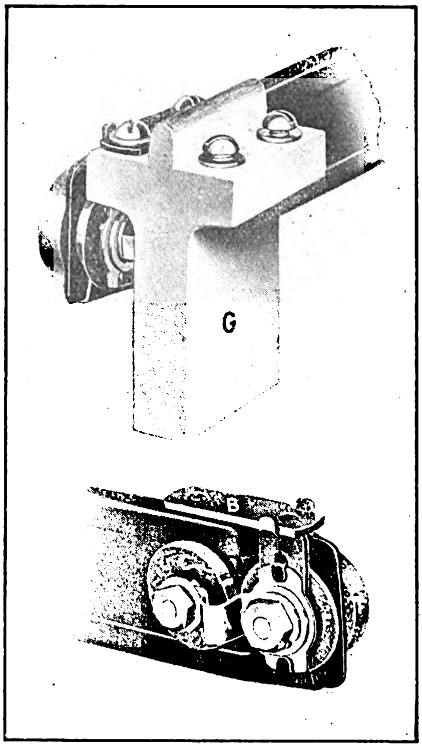
The cross-seat heater is manufactured with a solid baffle on the top, so that it is not required to add sheet metal under the seat cushions to prevent the heated air pocketing at that point.

All the cases are designed to permit access to the interior without disturbing the wiring or conduit.

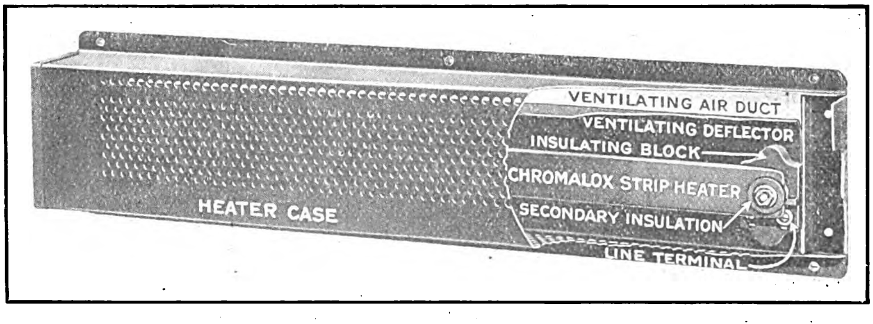
In the accompanying illustration showing the mounting of the heating element, the expansion strap, *A*, is welded to the mounting bracket, *B*, which is fitted with a clearance washer to allow free movement of the heating unit, thereby providing means to relieve the mounting bracket *B* from strain due to expansion and contraction of the unit.

The "Lavarock" terminal insulator, *C*, is designed to seal the outlet, preventing any accumulation of dust or moisture that might cause leakage from the sheath to the terminal. The heater sheath *E* is further insulated from the mounting bracket *B* by heavy "Pyroplax" flanges, *F*, which constitute a secondary insulation between the heating unit and mounting block *G*.

This mounting block is of heavy molded "Pyroplax" insulating material with threaded metal inserts molded in, for fastening.



Detailed Views of the Terminal Mounting, Showing the Arrangement for Safety and Accessibility



A Ventilating Duct in the Case Keeps Down the Temperature of the Top and Back and Eliminates the Need for Insulating Material Behind the Case When It Is Mounted

American Association News

This Year's Exhibits a Half-Million Dollar Show

Equipment for Modernization of All Departments Featured the Display at A. E. R. A. Convention—Space Taken by the 194 Exhibitors 14½ per Cent Greater than in Any Previous Year

THE exhibits at the Atlantic City convention of the American Electric Railway Association this year were bigger and better than ever before. There was more new apparatus and equipment shown than at any previous convention, indicating that the manufacturers are doing their part toward modernization of the industry and following more progressive lines of thought in the design of their equipment. Three railways and the association itself contributed to the educational value of the convention by instructive exhibits.

More space was taken for exhibition purposes than in any previous year. A total floor space of 86,349 sq.ft. was used by 194 exhibitors, an increase of 10,920 sq.ft. over that occupied at the 1923 convention, which was the largest up to that time. In per cent the increase amounts to 14½.

In analyzing the various equipment lines displayed the exhibit of buses was most extensive. Of the entire space 23,743 sq.ft., or 27½ per cent of the total, was occupied by bus displays. There was a total of 54 complete buses on exhibition together with 12 stripped chassis. The buses shown were either of a de luxe type or of attractive design intended particularly for display and to attract attention. Many of the delegates remarked that the very sight of such magnificent buses made them want to ride.

The editors of ELECTRIC RAILWAY JOURNAL collected considerable information this year as to the cost of exhibits to the various manufacturers. Based on information from more than half of those who had displays, it is estimated that about $569,000 was expended by manufacturers in placing their products on display at the Pier. This shows that the manufacturers certainly did their part as a contribution toward making this convention a success.

The decorative features and the scheme of colors used were new and attractive. Probably the most striking feature was the treatment used in the main ballroom at the entrance. The motif followed was Chinese. Stands with Chinese lanterns were placed on the foyer floor and additional Chinese lanterns were carried on supports on the pillars. The balcony was hung with Chinese decorations and a big drop picture at the end of the hall showed a water scene with a Chinese junk in the center. Directly opposite the entrance was a pagoda with Chinese dragons and lanterns. Special treatment was also given to each of the other exhibit halls. Thus the Annex was in green and white, Machinery Hall and the meeting rooms were in white and gold.

RAILWAYS EXHIBIT PROGRESS MADE

Three railway companies exhibited practical examples of their work in booths fitted up in a manner as attractive as those of the manufacturers.

The Chicago Rapid Transit Company and the Chicago, North Shore & Milwaukee Railroad showed samples of the artistic and effective posters that have been used in connection with their work. In addition, some of the original water-color paintings from which the posters were made served to illustrate the care which is taken to obtain high-grade work.

The Public Service Railway displayed pictures of every phase of its big transportation system—cars, buses, ferries, terminals, power houses, and substations. An interesting feature was a map showing the old pre-war 5-cent fare area compared with the present 5-cent area. Charts on one-man car operation, bus time-tables, and window posters were included.

THE ASSOCIATION EXHIBITED STANDARDS AND PUBLICITY MATERIAL

The association attempted more than ever before and it has succeeded in doing more in its exhibit. In short, it kept in step with the bigger, better and brighter than ever slogan. Through the courtesy of various manufacturers and operating companies, a display of standard designs of overhead line materials, track materials and car equipment materials was prepared. In addition, there was a number of charts showing track standards and certain proposed standards.

Another section of the booth was devoted to posters, prepared by the association's advertising and publicity section.

The Association's Bureau of Information and Service prepared a number of charts to show the vital statistics of the industry. These were so displayed that he who runs may read. In addition to these charts the bureau exhibited copies of its various compilations and reports, together with other association literature.

Among the standard devices shown were axles, journal boxes, brake shoes, limit of wear gage, bolted joints for 9-in. girder grooved rails and for 90 and 100-lb. standard A.R.A. and for 80-lb. A.S.C.E. rail. There were in addition standard rail designs and a complete line of standard line material for overhead trolley, as contained in the Engineering Manual, Section D, 102-21. Then there were charts to show the standard uniform system of track spirals, turn-outs and cross-overs, car clearance easements, proper location of tongue switches and dimensions of tongue switches, mates and frogs, bolted rail and manganese steel crossings, together with gages and flangeways.

The committee on city and interurban operation had an exhibit of copies of committee reports and handbook of modern methods and practices. A number of attractive posters, illustrating electric railway advertising, were shown and especial attention was attracted by the posters of the London Underground group, of which a large variety was on display. United Railways & Electric Company, Baltimore, Md., furnished a safety display for use in the schools of Baltimore to teach children the fundamental principals of safety.

MANY ATTRACTIVE BUSES SHOWN

In the exhibit of buses and bus accessories there were many novel designs. The Six Wheel Company and the International Motor Company displayed several models of six-wheel buses. The Transit Equipment Company featured an Uppercu coach with front wheel drive. Advantages claimed for this arrangement include low floor height, simplicity of frame construction and short turning radius. As the tractive effort is always in the direction of travel it is said that a more abrupt steering angle can be used. A bus with 220-in. wheelbase can be turned in a 50-ft. street.

The Yellow Coach Manufacturing Company showed several double-deck models with both pneumatic and cushion tires. This company's new design of sleeve and poppet valves for bus service was of particular interest. The Continental Motors Corporation showed four different types of six-cylinder bus motors. There were various arrangements of power brakes which showed marked improvement both in design and construction. These included air, hydraulic and a combination of the two. Safety devices have also been applied to buses which include a complete pneumatic safety control system, with interlocked accelerator and "deadman's" feature. Air brakes of the Westinghouse automotive type included a 3-cu.ft. high-speed compressor, with capacity for supplying air for all pneumatic purposes.

A new combination air-hydraulic system of four-wheel brakes was shown by the Timken-Detroit Axle Company. In addition to this feature the front axle had a large drop which allowed for low floor construction. The exhibit of buses was noteworthy particularly for its great variety and included many double-deckers, new light-duty types, parlor car arrangements with wide windows, individual seats and smoking compartments. The bodies also showed marked improvement in lighting, heating, and ventilation.

Railway Supply Companies Show New Developments

The modernization taking place in the manufacturing end of the railway industry was shown in many of the displays of the manufacturers and supply companies. These covered a wide range, improvements having been made for practically all departments.

It was easy to spot the new devices shown by the Westinghouse Electric & Manufacturing Company, as each development was marked with a large orange star. A further departure was the display of apparatus still in the experimental stage. Among these were two developments in motor lubrication practice. The first was an oil sealed housing. The new design of housing appears to have many advantages. The feed of oil is made constant at all times by pumping it into the chamber. The separate general supply chamber is kept filled, so that the amount of oil that must be added is not left to the oiler's judgment, and the supply to the waste chamber is automatic. In the second development, a new sealed sleeve bearing, oil is prevented from leaking into the winding and dirt and grit are kept out of the oil. It is claimed that additional oil is required only once or twice yearly.

Recent developments of renewal parts were on display, which included a unique scheme for ventilating old type motors. This scheme is said to increase the continuous capacity of the motors by more than 30 per cent with only 2 per cent additional weight. For convenience in rewinding armature coils, rebanding and repairing commutators, all insulating materials are now assembled in standard packages by the Westinghouse company, so that every item required is ready for the workmen to use. A new development in brush holder design included a detachable box, which facilitates necessary replacement at low cost. Another new type of brush holder shown was provided with a dust cap to prevent the entrance of sand or dirt into the brush holder.

Power men were particularly interested in the new type of oil immersed transformer developed to prevent explosions and increase insulating and cooling properties. In this construction the oil level is below the top of the tank, so as to provide a gas space of sufficient capacity to permit the rise and fall of the oil level. The breathing action of the transformer deoxidizes and dehydrates the inhaled air, thus maintaining the gas space with dry inert gas. A diaphragm construction is provided which ruptures in case an abnormal pressure develops.

The General Electric Company had a large display of its products to show how that company could help modernize electric railway equipment. The car equipment man's attention was attracted to the reduced number of standardized railway motors and to improvements in light-weight multiple-unit control and improved equipment parts. A new type of brush holder with renewable carbon-way has been designed to reduce maintenance cost. New designs of overhead line material and sectionalizing equipment showed the company's effort to reduce the investment in distribution copper. New types of welding equipment were shown, which should make substantial savings in the reclamation of parts. The general idea in the entire exhibit was to show apparatus in actual operation and to group this equipment around a display of parts and materials which could be used for maintenance.

A new idea in the merchandising of line materials was shown by the Ohio Brass Company. It was called a traveling catalog and consisted of a truck equipped with special body, arranged so as to display a full line of O.B. line material when the truck was open for inspection. This truck has made an extended trip of over 100,000 miles and has visited a great many railway properties.

Improvements in Car Heaters

All of the various heater companies showed improvements in electric heaters for cars. The Railway Utility Company showed a new type of inclosed coil heater. The heating element consisted of nickel chromium inclosed in a refractory material. It possesses large overload capacity without danger of overheating and damaging parts. A novel feature of the case construction included a ventilating flue in the back at the top of the case. This feature was intended to prevent radiation through the sides and ends and so decreases the temperature at the top and back of the case.

Interchangeability of heater parts was featured by the Gold Car Heating & Lighting Company. New designs of electric heaters selected for use by the New York Central and Baltimore & Ohio Railroad were shown. The principal feature of these was simplicity in design, so as to reduce the number of parts. Particular attention was given to terminal arrangement.

A new design of heater coil construction was shown by the Consolidated Car Heating Company, which was intended to take up less space and thus could be used in replacement of the inclosed element units. The Consolidated Car Heating Company also showed its new type of pedal control for doors. The particular features of this equipment were the small amount of space required underneath the platform for operation of the doors and their control by depressing a pedal.

The National Pneumatic Company also showed a very large number of door engines and door control equipment. Full-sized models of cars were used to demonstrate the best practice in door engine installation, and the importance of safety in control and operation was emphasized. A new development shown was a four-way selector and grouping valve, which with a single control handle actuates any one of four door engines or couples up any two of them.

An improved type of step construction was shown by the Irving Iron Works. The principal feature was the open construction used, so that dirt, snow, ice and the like would fall through and prevent slippery or wet conditions either on the steps or inside the car. The construction also provided a non-slipping surface under all conditions.

Several new designs of seats for cars and buses were shown by the various seat manufacturers. The American Car & Foundry Company showed a new type of reversing mechanism with link construction. The pedestal was made of pressed steel and was independent of the seat end. A single automatic foot rest was operated by the power arm. All parts subjected to stress were drop forgings and particular attention was given to interchangeability of parts.

A very complete line of new developments in car seats was also shown by the Hale-Kilburn Company. The distinctive features were increased comfort, attractive appearance, and particular attention to producing parts which would lower maintenance costs.

A new contribution to the motor coach seating line was shown by the Heywood-Wakefield Company. This consisted of three types of chairs, which showed the last word in beauty and comfort.

A new type of car flooring called Truss-plate was exhibited by the Wheeling Corrugating Company. This type of flooring has been used by the Boston Elevated Railway and the Interborough Rapid Transit Company with a mastic covering as the wearing surface. It weighs but 4 lb. per square foot, and is of particular advantage in light weight car construction.

Valuable information as to where Haskelite and Plymetl could be used to advantage in reducing car weight was shown in the exhibit of the Haskelite Manufacturing Corporation. This type of construction is also proving of advantage in reducing the noise and drum effect in all-steel car construction and in providing necessary insulation against cold.

The Railway Improvement Company had an exhibit arranged to show improvements that would reduce railway motor maintenance. This consisted of a revamped 101-B motor removed from service on the Connecticut Company. New heads and bearings in this motor were designed particularly to insure long life and decrease trouble. The weight of each axle bearing was reduced from 10 to 15 lb. and special attention was given to provisions that will make the bearings stay tight when installed.

Fare Collection Systems

There were very complete displays of fare boxes and fare registering equipment. A new combination electric coin and token controlled passimeter was shown by the Perey Manufacturing Company. This equipment is adapted to any combination of two coins or tokens. This company also showed an interesting fare box and overhead register combination, which provided automatic, instantaneous, visible and audible registration. Improvements in fare collection were also shown by the Rooke Automatic Register Company in the form of its new automatic register, which takes nickels, dimes and quarters.

The Cleveland Fare Box Company showed a new locked box and key of peculiar design for use with fare boxes. This was a four-way box with eight levers and 16 locking surfaces. A new detail fare recorder was also exhibited by the Ohmer Fare Register Company, which had a capacity for recording fares ranging from 1 cent to $9.99.

A new design of light-weight trolley harp was shown by the R. D. Nuttall Company. The shape of the harp was arranged to eliminate all ribs and projections and give a smooth outline with no sharp edges or corners to catch in overhead construction. All screws and rivets were made flush with the outside surface. Other improvements included an axle pin with special provision for grease lubrication and new design contact springs.

The new type of direct-connected trolley catcher used by the Boston Elevated Railway formed a part of the exhibit of C. I. Earll. With this construction all brackets are eliminated as the catcher is bolted directly to the car. Provision is made for easy removal of the entire unit or the drum may be removed separately for inspection and overhauling.

Improved methods for painting cars proved a live subject for discussion and demonstration at the various paint displays. The R. F. Johnson Paint Company demonstrated some late developments in finishing of cars and buses. A new two-coat enamel system, requiring only a day and a half for application, was one of the late developments by this company.

Aluminum paint for car decoration and painting attracted considerable attention at the exhibit of the Aluminum Company of America. The use of paint as an advertising material and as a preventive of accidents was stressed by all the various paint salesmen and yellows and various orange shades seem to be the colors most in demand. At the exhibit of the Glidden Company demonstrations were given of the economies resulting from the use of Ripolin railway enamels.

FIVE ELECTRIC RAILWAY CARS EXHIBITED

On Arkansas Avenue, just across the Boardwalk from the Pier, were displayed five complete cars. These included one of the new Illinois Traction System's light-weight interurban cars as built by the St. Louis Car Company. This car was arranged for one-man and single-end operation. Light weight was a big feature and this car completely equipped weighed but 36,840 lb. and is taking the place of old equipment in the same service that weighed 90,000 lb.

Another car shown was a double-truck safety car, built at the American Car Company's plant in St. Louis for the Eastern Texas Electric Company, at Beaumont, Tex. Double folding doors were provided at diagonal corners, and a motorman's door on the opposite side of each platform. The weight was 28,500 lb. with seating capacity of 48.

A light-weight interurban car for the York Railways, mounted on Brill 77-E-1 trucks, and a special single-truck safety car built at the Kuhlman plant for the Columbus, Newark & Zanesville Railway were also shown. The York car seats 52 passengers, and the Zanesville car has a capacity of 28.

The de luxe idea in cars influenced the design of another car shown with the group. This had a low level floor, and seats for 48 passengers. Particular attention was given to a pleasing interior finish.

TRACK AND LINE MATERIAL

Way engineers found much of interest in the various track and paving exhibits. An alloy steel crossing built of 9-in. flange-bearing rails rolled to fit with A.E.R.E.A. standard 9-in. sections was shown by the Lorain Steel Company.

A new design of ground throw switch in a very compact box was exhibited by William Wharton, Jr. & Company, Inc. The operating lever lies on top in a recess in the cover of the box. This makes it possible to have a tight fit which will keep out dirt, water and other refuse. The mechanism is steel throughout and will work the same as an ordinary spring box set to throw either way or for one-way traffic.

A bituminous material shaped to fit any rail section was shown by the Philip Carey Company. This is being marketed under the trade name of Elastite rail filler and provides a resilient cushion that takes up vibration and movement of the rail. The construction also provides a watertight joint so as to keep out water and frost.

Many new specialties were shown of interest to the line department. Hubbard & Company showed many new devices for transmission, distribution and signal work. These included pole steps, dead ending clevices, wire holders, pole-top fixtures and spreader racks. A new pole-hole digger was shown by the Buda Company. This company also showed many specialties in trackwork.

The accounting department of railways found much interest in the labor-saving machines exhibited. A new typewriter key punch was shown by the Powers Accounting Machine Company. This was a combination of a standard typewriter and a key punch so as to eliminate punch operators. The typist in making out invoices can punch the tabulating card at the same time as the other record is made. A new duplicating machine for making copies of reports, statements, bulletins and other forms written with typewriters, pen or copying pencil was shown by the Beck Duplicator Company. This is being marketed under the trade name of "Speedograph."

A new type of coin assorting and accounting machine, which is in use by the Conestoga Traction Company, was exhibited by the Lancaster Automatic Coin Assorting and Counting Machine Company. This machine automatically feeds coins to the sorter and counter without an attendant. A variety of new machines for sorting, counting and wrapping coins or tokens was also shown by the Sattley Company.

Engineering Executive Committee

THE first meeting of the new executive committee of the Engineering Association was held at Atlantic City Oct. 9. Those present were President Charles H. Clark, chairman; C. R. Harte, Daniel Durie, M. B. Rosevear, R. H. Dalgleish, F. H. Miller, G. C. Hecker and Past-Presidents H. H. Adams, J. H. Hanna and H. A. Johnson.

The report of the committee on subjects was read and approved with minor modifications. This report was published in the issue of ELECTRIC RAILWAY JOURNAL for Oct. 11, page 650. The principal modifications were the following:

The committee to consider carhouse wiring and car wiring rules of the National Electric Code was instructed to include in its studies the subject of wiring of garages used by electric railways for storage and maintenance of buses and trucks.

Two new subjects were added to the assignment of the committee on equipment: (6) Continue the study of helical and spur gearing; (7) study methods for reducing noise in car operation in co-operation with the committee on way matters.

An additional subject was assigned to the committee on heavy electric traction: (4) Continue the study of train operation, with particular reference to articulated trains.

Subject (2) of the assignment of the committee on power generation and conversion, as published, was eliminated. This was the study of uniform methods for reducing failures of power apparatus and interruptions to service originating within the generator or substation.

A new subject was assigned to the committee on power transmission and distribution: (8) Co-operate with A.S.T.M. on the following projects: (a) Bring into complete conformity the hard-drawn copper trolley wire specifications of the two associations; (b) prepare specifications for high-strength low-conductivity trolley wire for adoption as recommended standard.

A new assignment to the committee on way matters is as follows: (8) Study methods of reducing noise in car operation in co-operation with the committee on equipment.

A special committee on recording power failures was authorized with the assignment to study of uniform methods for recording failures of power apparatus and interruptions to service. This formerly had been assigned to the committee on power generation and conversion.

A letter from T. K. Murphy of Pratt & Lambert, Inc., was read, which outlined the advantages to the railways and manufacturers of standardizing colors for use in finishing electric railway cars. It was stated that there are more than 100 shades of green, yellow, orange, red, cream, etc., now in use and that a heavy overhead expense is involved in manufacturing all of these special colors. After a lengthy discussion it was the opinion of the committee that standardization of colors as proposed by Mr. Murphy would be impractical and it was voted to drop the matter.

It was voted to adopt the suggestion of C. F. Gailor that stickers be furnished railway member companies with the inscription "We use A.E.R.E.A. standards." It was also suggested that manufacturers might indicate in their catalogs which of the materials listed were standard.

A letter was read from H. C. Wallace of the Department of Agriculture inviting the association to send representatives to the national conference on utilization of forest products, to be held in Washington Nov. 19 and 20. R. H. Dalgleish volunteered to represent the association and invitations were also sent to committee chairmen interested.

A letter was read from A. B. Foote of the Division of Simplified Practice inviting the association to be represented at a conference to prepare a tentative simplified schedule of gages and sizes of sheet steel. The secretary was requested to have a representative of one of the car builders present at this conference.

Mr. Miller stated that the equipment committee had been requested to co-operate with the Society of Automotive Engineers committee in assisting the Public Utility Commission of New Jersey to arrive at a reasonable set of specifications for bus design standards which would be satisfactory both to operators and designers. After considerable discussion the matter was referred to the executive committee of the American Association with the statement that the Engineering Association stands ready to assist in this work if authorization is granted.

News of Other Associations

Commission Regulation Indorsed

Investment Bankers Consider Utility Problems and Make Recommendations on Powers of State Commissions

AT THE annual meeting of the Investment Bankers' Association of America, held in Cleveland, Sept. 22-24, Thomas N. Dysart, of William R. Compton Company, St. Louis, was elected president for the ensuing year, and Henry C. Olcott of the Continental & Commercial Trust & Savings Bank of Chicago was appointed chairman of the public service securities committee of the association. The report of this committee was the principal point of electric railway interest at the Cleveland convention. It was presented by Henry R. Hayes, chairman. An abstract follows:

REPORT ON SECURITIES OF PUBLIC SERVICE COMPANIES

In view of the increased popularity of public utility securities, especially noticeable this year, it is not today of prime importance to discuss methods of improving the acceptability of such securities. Investors generally recognize the inherent soundness of the public utility business. Essentially this condition has been brought about by the industry itself giving a frank and open story of its business and, in part, by its selling securities direct to the consumer. Besides this, the state regulatory commission and court decisions have had the effect of assisting the industry in adjusting itself to post-war conditions as well as protecting the business from malicious attack, too often of political origin.

The committee this year has been more concerned in studying problems which are or will soon be of concern to investment bankers, namely, those attendant on the great expansion of the public utility industry, which is destined to take place in the next twenty years.

The position of this association with respect to state regulation is defined in general terms in the 1923 annual report of this committee, as follows:

> The committee recommends, therefore, that members of this association urge, wherever lacking, that the state commission be vested with authority over the valuation, rates, services, and capitalization of privately-owned plants and that there be required and published full financial reports of operation.

This opinion assumes that state-wide regulation must necessarily be administered in a broad and judicial manner in the interests of the public served, as well as of the investor. This association has not recognized any conflicting interest between the public served and the investor. On the contrary, it has pointed out that the interests of both are identical (see the 1922 annual report). However, it is far from being unaware that many, including self-seeking politicians, would have the public believe otherwise.

In the great expansion of the industry which is taking place there is keen competition for investment funds. Investors, therefore, can and actually do pick and choose their investments with discretion, favoring to a marked degree investments in those properties which are protected best by scientific regulation, rather than properties which are subject to the whims and fancies of state or local legislative bodies or executive officials.

We are continually reminded of the fact that more development takes place and rates and services are best in those states where state-wide regulation has not been subject to attack. There, we find, too, strong support of state regulation on the part of the public. Such results are obtained only when a legislature appropriates adequate funds for administration, and commissions are of proper caliber for their tasks.

For the present this committee has postponed, except in special instances, studies of the regulatory laws with respect to privately-owned properties in the following states and territories: Alabama, Arizona, California, District of Columbia, Georgia, Idaho, Illinois, Kansas, Kentucky, Maine, Maryland, Massachusetts, Michigan, Minnesota, Missouri, Montana, Nevada, New Hampshire, New Jersey, New Mexico, New York, North Dakota, Ohio, Tennessee, Utah, Vermont and Wisconsin.

Those states have been eliminated from its studies for the present, largely because there does not appear to be any immediate need for comprehensive changes.

With regard to the regulatory laws of states other than those above mentioned, it has recommendations to make to the district groups for their consideration. With respect to the laws of states not now reported upon, recommendations will be made in interim reports or direct to district groups.

The laws of many of the states vary greatly with respect to the term of franchises. State laws through constitutional provisions provide for the issuance of franchises of short duration—say 20 years. As we know, where the laws permit bonds are more often in good markets issued for longer terms. From the point of view of providing conditions for the issuance of securities it is distinctly in the interests of sound banking desirable to have issued by state commissions the so-called "indeterminate permits" as distinguished from franchises perpetual or limited in term.

This subject was discussed in the 1923 report, which sets forth, among other things, the states which do not require of these kinds of properties a standard system of accounting. The district groups of this association are again urged to exert efforts to accomplish sound accounting on the part of municipalities. As purchasers and distributors of municipal obligations it is surely a duty to do all that is possible to require sound accounting and administration on the part of municipalities.

The report was signed by Henry R. Hayes, chairman; Eli T. Watson, vice-chairman; H. M. Addinsell, Russell D. Bell, Charles R. Blyth, Chester Corey, John Esmond, Edgar C. Rust, C. J. Waddell, James C. Willson.

New England Club Meets Oct. 30

THE October meeting of the New England Street Railway Club will be held at the Copley Plaza Hotel, Boston, Mass., on Oct. 30. The afternoon meeting, which will be called to order at 4 p.m., will be devoted to a series of papers on the following subjects:

"Comparison of Maintenance Costs of Old and Modern Car Equipment," by W. C. Bolt, superintendent of rolling stock and shops Eastern Massachusetts Street Railway.

"Lubrication of Railway Motors," by H. N. Ransom, Railway Improvement Company.

At the evening meeting the topics will be:

"Education," by Edward Dana, general manager Boston Elevated Railway.

"Co-ordination of Motor Vehicle and Electric Railway Service by Electric Railway Companies," by A. E. Potter, president United Electric Railways, Providence, R. I.

"Observations at the A.E.R.A. Convention," by R. D. Hood, the general manager Massachusetts Northeastern Street Railway.

The News of the Industry

Protest Against Interstate Lines

Electric and Steam Railroads in Massachusetts Agitated Over Inroads of Unregulated Bus Lines

Electric railways in Massachusetts are resisting the alleged unfair competition of buses, particularly those proposed for interstate business. On the other hand the Attorney-General is being appealed to by the bus promoters to pave the way for such operation. In consequence the situation in central and eastern Massachusetts is growing acute.

The principal question appears to be: Shall interstate bus lines, which run from one state into the next, almost express between terminals, be permitted? If such lines are permitted, then the question appears to be: To what extent can the interstate lines be regulated?

Several interstate lines are now operating. Some of them have a joint terminal station in Providence. In some Massachusetts cities the Mayors have declined to grant any licenses to such lines; in others licenses have been granted, and in some the companies are operating without licenses on the contention that they need none. They claim that no state law can prevent a transportation line from carrying a passenger into another state, and in at least one instance a bus line has been brought into a local court and fined $10 for operating without a local license, and it has appealed the case in order to test the matter in a higher court.

PROTESTS OVER-RULED

Thus far the railroads have opposed the granting of licenses to these interstate bus lines, but the Massachusetts Public Utilities Department has overruled the railroads and granted state licenses on the ground that there is no law to prevent these companies from organizing and carrying passengers. Street railways also have protested, but it has been pointed out to them that they have the same right to establish bus lines as the new bus lines themselves. So far as the railroads are concerned, they have been acting separately thus far, but it is understood that they are formulating a general policy toward the interstate bus lines to be followed whenever the occasion arises.

A case under immediate consideration is that of the Interstate Limited Motor Coach Company, which operates a bus line between Fall River and Providence. James M. Swift, former Attorney-General of Massachusetts, is an officer in this company and is counsel for an association of such companies, known as the Motor Coach Association of New England. Mr. Swift has already argued his case once before the present Attorney-General, Jay R. Benton, to prevent the institution of injunction proceedings against the interstate bus lines. His association represents companies which run lines from New Bedford to Providence, from Taunton to Providence and from Boston to Providence. These lines have been granted joint station rights in Providence by the police authorities of that city.

Mr. Swift argues that the interstate lines are not law-defying organizations, but desire to give safe and reliable service so as to win good will. Hence they do not need local control as a police measure, and the opinion is that the law does not compel them to take out local licenses. Where they have asked for local licenses, so that their legality should not be questioned, the street railways have opposed them. Such is the case in Fall River, where the Eastern Massachusetts Street Railway offered the opposition. The railroads and the street railways contend that the interstate bus lines take traffic away from them to such an extent that the existing companies may be forced to abandon service.

Mr. Benton has been asked by a number of city solicitors to proceed in court to have the interstate lines enjoined from operating without license from the cities and towns traversed. He has given some semi-public hearings in his office at the State House and has more hearings scheduled for the near future.

Rapid Transit Plans Submitted in Chicago

Entire Situation There Reopened by Proposals Made by Mayor Dever, Mr. Blair, Mr. Busby and Mr. Insull, Together with Engineering Report by R. F. Kelker, Jr.

THE final determination of the Chicago city administration to push its own subway plan to a test vote on municipal ownership, possibly as early as next February, has been revealed by Mayor Dever. In a message submitted to the City Council on Oct. 22 he offered a proposal in competition to one drawn up by Henry A. Blair, president of the Chicago Surface Lines; another by Samuel Insull, representing the elevated lines, and one by Leonard Busby, head of the South Side Lines. These proposals and several alternate proposals are now before the local transportation committee of the Council and a fifth major proposal for a $225,000,000 subway system is being drawn by the reincorporated Chicago Municipal Subway Company.

Mr. Blair submitted his project as a private citizen. He came out for a consolidation of the surface and elevated lines under a unification plan which ultimately would figure beyond $350,000,000. Under it the city would be permitted to purchase the entire system "upon due notice" or by amortization of a price based on recent valuations of the lines plus $66,550,000 in surface and elevated lines extensions purposed to be completed in the next six years.

Following Mr. Blair's lead, Mayor Dever expressed hope of accomplishing virtually the same result through a different channel. He aims for eventual unification, with the city taking the lead. Mr. Blair would have the city as a partner throughout, but Mr. Insull did not provide for such partnership or for participation of the surface lines in his subway scheme.

With Mr. Insull in Europe, his attorney, Patrick J. Lucey, indorsed Mr. Blair's declaration that unification is the only solution of the Chicago transportation problem. Mr. Blair, in his transmittal letter, summarized his aims as follows:

> A single fare and universal transfers for both rapid transit and surface lines, service at cost, municipal partnership in operation and eventually municipal ownership. It should be possible for a Chicago citizen to board the street car in front of his home, transfer to a rapid transit train and enter the loop through a subway all for one fare.

Mayor Dever said he hoped the surface and elevated lines would come to terms, but that he could never consent to take up the $90,000,000 elevated securities and the $262,000,000 surface lines securities as suggested by the bankers' committee in the purchase negotiations.

Mayor Dever declared himself virtually committed to city ownership because the state laws governing utilities have been extended until the city has no control whatever over transportation or rates of fare.

His subway proposal is said to be largely the same as that suggested by Major R. F. Kelker, Jr., the city traction expert, who submitted a detailed plan for a downtown subway and projecting elevated lines to the City Council committee on local transportation.

The Mayor said:

> Unified service should be rendered at the lowest possible cost and at no profit, in order that a reasonable rate of fare can be maintained. The settlement should be on such a basis as to permit the car riders to transfer between the subway, the elevated lines and the surface car lines and ride from any one part of the city to any other part of the city. The settlement will not be satisfactory unless it involves a

restoration to Chicago of home rule over the local transportation facilities and unless it avoids increasing the present burdens of general taxation.

In my opinion, a comprehensive settlement producing these results can now be brought about only by the acquisition of the existing surface line and elevated properties by the city through the use of the special bonds which I have heretofore described and by the immediate building of subways by the city, to be operated in conjunction with those properties so acquired by the city.

If it becomes clear that a settlement cannot be brought about on that basis because the persons holding the securities of the private companies cannot agree with the city on a fair price, then it seems to me that the city will obtain the largest measure of substantial relief in the shortest time through the immediate building by the city of a rapid transit system, including subways, to supplement the existing services by the surface and elevated lines.

This municipal rapid transit system should be planned, (a) so as not to duplicate the service now rendered by the surface and elevated companies, (b) so as to make possible co-ordination with the service furnished by the Chicago City Railway, the Chicago Railways and the Chicago Rapid Transit Company if and when any or all of them shall have been acquired by the city and (c) so that the system can be extended as rapidly as the city's financial condition will permit if none of the existing systems is acquired by the city.

Mr. Blair's proposed system would be capable of carrying 2,000,000,000 revenue passengers a year and, with the service-at-cost provision, he said financiers had declared the project to be a good investment. He revealed that he has had engineers and other experts working for two years to perfect the details. He is ready to go in for full unification or to enter a partnership with the city if the elevated lines object to consolidation. Special legislation, he said, would cause some delay, after which the consolidation would be ready to go ahead with the construction outlined in two three-year periods as shown in the table in the next column.

Mr. Blair called attention to the fact that the city's $40,000,000 traction fund was obtained through the 55 per cent split of surface lines receipts paid entirely by street car patrons and said it was only fair that this money be used to construct the underground link connecting the systems.

Some of the major paragraphs in his summary read as follows:

Service at Cost.—The lines to be operated under a service-at-cost agreement between the city and the companies which will, subject to regulatory statutes, provided rates of fare adequate to produce all operating expenses, taxes, maintenance, renewals and replacements, a fair return on the capital investment, an amortization fund for city ownership at a rate to be agreed upon, fare stabilizing fund and any other proper and necessary charges arising out of the operation of the transportation facilities.

Rates of Fare.—A one-city-one-fare system with free transfers between the several types of service included; rates of fare to be automatically adjustable to the cost of the service through the operation of a fare-control fund to be set up and maintained between certain maximum and minimum limits to be agreed upon.

Right of City to Purchase.—Acquisition by the city of all of the railroad properties at any time, upon due notice, through direct purchase or through the gradual amortization of capital in favor of the city.

Reorganization.—A reorganization of the financial structures of the companies which will bring the total security issues to par with the established capital value of the properties from year to year.

Supplemental and Auxiliary Bus Service.—Provision will be made for the development of such supplemental and auxiliary service by motorbuses wherever the demand exists and conditions for its operation are suitable.

Control.—Until under the provisions of this plan the operation of the railway properties is acquired by the city, or the city purchases the properties, the control shall remain with the companies, the city to be given its representation on the board of direction when the plan becomes effective and the representation of the city on the board to be increased from time to time in direct ratio to the equity of the city in the properties.

FIRST THREE YEARS

City-built subway on State Street, four tracks	$27,000,000
City-built subway on Washington Street from Grant Park to Union Park, two tracks	8,400,000
Elevated line construction and equipment	17,600,000
Surface Lines construction and equipment	15,000,000
Total	$68,000,000

SECOND THREE YEARS

City-built subway on Jackson Boulevard and Franklin Street from Grant Park to a connection with the east portal of the Van Buren Street tunnel	$4,000,000
Elevated lines construction and equipment	26,950,000
Surface lines construction and equipment	7,000,000
Total	$37,950,000

SUMMARY FOR SIX YEARS

City-built subways	$39,400,000
Elevated lines construction and equipment	44,550,000
Surface lines construction and equipment	22,000,000
Total for six years	$105,950,000

IMPROVED SERVICE RESULTING FROM ADDITIONAL DEVELOPMENT

Present rush-hour service in business district in cars per hour:	
Surface cars	1,103
Elevated cars	1,228
Total	2,331
Improved service possible in business district in cars per hour under proposed plan:	
Surface cars	1,703
Elevated cars	3,200
Total	4,903
Increase in cars per hour under proposed subway plan:	
Surface cars	600
Elevated cars	1,972
Total	2,572
Increase in cars per hour under proposed subways and rapid-transit development	1.10%

Mayor Dever and Alderman U. S. Schwartz, chairman of the local transportation committee of the Council, revealed that they had had an oral summary of the Blair plan from Mr. Blair while the recently dissolved transit purchase conferences were in progress. Mr. Schwartz said that he told Mr. Blair then that the people of Chicago would never consent to franchises for long periods and that without the long franchises the plan could not be financed.

Mr. Insull is seeking franchises providing for $23,000,000 of additional construction, including an entirely new north and south line crossing the city a mile west of the loop and connecting with the established lines at both ends.

Twin Cities Fare to Be Settled by January

The Minnesota Railroad & Warehouse Commission has decided that its report on fares to be charged in Minneapolis and St. Paul by the Minneapolis and St. Paul street car companies will be concluded by the end of December and will be submitted by Jan. 1, according to a recent statement of Commissioner Bowen. Briefs are to be filed by the two municipal corporations and the railway corporations on Oct. 15. Later final arguments on the briefs will be presented and the commission will begin to prepare its decision.

The controversy in these cities has been going on now for practically two years. The first action was enactment by the 1923 Legislature of an act which placed rate-making powers for the railways in control of the state commission, instead of the city councils. The 6-cent rates prevailing in the Twin Cities were undisturbed when hearings began before the commission in October, 1923. In view of the issue to be decided these rates are still on a temporary basis.

Receivers at Kansas City Await Instructions on Buses

The receivers of the Kansas City Railways are effecting a crystallization of their ideas regarding bus service, and it now seems fairly certain that such service will be installed by the company. It is reported, however, that some of the bondholders do not favor ownership and operation of buses by railways in a community no larger than Kansas City. On the other hand the receivers are said to be considering various plans of operating buses. One plan of this kind is said to contemplate a service with buses in the congested area with transfers to street cars that serve outlying districts. This downtown service would take up the present overflow. A 10-cent fare would be charged, it is said, with transfers free to the street cars. The receivers are also considering the installation of bus service into residence districts and the installation of a deluxe bus for special trips or sightseeing.

The receivers consider that the officials of Kansas City, Kan., have not fulfilled the agreement they made in July to withhold consent to bus operation in compensation for additional railway service into the industrial section. The agreement was made in July. But instead of bus service being eliminated, a tentative agreement was made with a new bus company, the H. H. Moore organization, under which ten or more buses are now being operated, some cross-town in Kansas City, Kan., covering a field in which it was intended to provide additional railway service.

The receivers also consider that the city has not played fair with it by permitting buses to use the intercity viaduct. The railway pays rent for the use of the tracks on this city-owned viaduct. The buses, however, do not follow the routes of street car lines except on the viaduct. The receivers expect definite instructions from the federal court in November in regard to the extent to which they may go in the matter of installing buses.

"Read as You Ride."—The Grand Rapids Railway, Grand Rapids, Mich., in co-operation with the Grand Rapids *Herald*, has installed the "Read as You Ride" boxes in all cars and papers are furnished early morning patrons quickly and easily. The service will be daily except Sunday.

Lively Hearing in New York on Buses

Board of Estimate Finally Gets Around to Work of Publicly Considering Recent Applications—Public Gets First Chance to Air Its Views—Another Hearing Oct. 29

POLITE figures of speech lack the virility necessary to characterize properly recent political history in New York or to convey an accurate and adequate idea of the present tumult over transit affairs. Perhaps the nearest accurate picture to the current happenings is contained in Shakespeare's "Macbeth." If memory does not play us false there is a scene there in which the caldron boils and bubbles in a world of toil and trouble. Well, the transit situation in New York is something like that, only more so. In this case the Mayor of the second greatest city in the world is sitting on the lid doing his best to hold it down, but succeeding only partially.

Apparently everybody wants to run buses or pretends that he wants to run them. A semi-official count says that there are 51 applicants for bus rights, with new ones coming in every hour. More than 213 miles of routes are covered by these proposals. Not a neighborhood or section has been overlooked, except perhaps Staten Island. Staten Island is remote to most New Yorkers, but will be discovered sooner or later.

Anyway, the long deferred hearing on the bus applications was begun before the Board of Estimate and Apportionment on the morning of Oct. 22. Estimates of the number of persons in attendance vary, but a conservative opinion put it at more than 500. Extra police were on guard. Comptroller Craig sat silent throughout the whole proceedings. In fact, he read a book most of the time. The title of this he carefully guarded, but it is believed to have been "The Anatomy of Melancholy." Except for this the meeting was of the usual complexion. As the writer for the *Evening Sun* aptly put it:

"Murray Hulbert, president of the Board of Aldermen; Borough President Riegelmann of Brooklyn and the Mayor vied with each other in coining witticisms, epigrams and bromides. Some of the spectators openly growled the opinion that this was supposed to be a serious meeting, where wise decisions should be made rather than 'wise cracks.'"

To help make a long story short it can be said that the Mayor read a prepared statement. As for the proponents of the bus grants, all that were heard recommended that temporary franchises be granted by the city to the private companies and that the city abandon, at least for the present, any idea of municipal ownership and operation of buses. The Mayor said:

> Because of the vicious activities of those who have been opposed to the administration's transit policies, and because of the unnecessary hardships afflicted upon the traveling public by reason of such activities, the situation which confronts the people of the city of New York today is this:
>
> Either the duly elected responsible local officials of the city of New York must wait until a Legislature will empower them to proceed with the municipal ownership and operation of buses, which, however, from past experience does not appear to be very likely in the near future, or they must grant recapturable bus franchises to applicants acceptable to the people and the Board of Estimate and Apportionment upon terms which will permit of the taking over of such franchises when the Board of Estimate and Apportionment is legally empowered to proceed with the plan of bus ownership and operation.
>
> The Board of Estimate and Apportionment will not do anything inimical to the best interests of the traveling public. It is desirous of granting the wishes of the people in this very vexatious transit situation. A public expression of sentiment upon the disposition to be made of the bus problem will receive immediate and careful consideration of the members of the Board of Estimate and Apportionment, who are anxious to provide the immediate surface transportation service so absolutely essential to the comfort and convenience of the traveling public.

Out of this wilderness of words a public clamoring for more transportation is apparently supposed to figure out where it gets off. By liberal interpretation in some quarters this statement has been taken to mean that the city is prepared to meet the ideas advanced by the representatives of the taxpayers in attendance at the meeting. That was as far as things got. None of the representatives of the 51 individuals and corporations that have applied for franchises had an opportunity to be heard. Presumably they will have their inning at the session on Oct. 29, to which date the hearing was adjourned.

VARIED VIEWS ON TRANSIT REPORT

If the Mayor should adopt the policy of granting short-term franchises such action would be in keeping with the report made to the Board of Estimate by the Board of Transportation, a body appointed by the Mayor and authorized to study the transit situation. That report, abstracted elsewhere in this issue, is generally regarded as taking an advanced view of the situation and as being designed to help matters if its recommendations are followed. As to that, however, the Mayor said a few weeks ago that he did not intend to be bound by the recommendations of the report. The B.-M. T. sees that report as a good thing. G. M. Dahl, chairman of the board of that company, has indorsed the findings. So has the Citizens' Union. Well, the report says among other things that 5-cent bus fares are not always practicable and that for the present, at least, municipal ownership and operation are not feasible.

But that is only part of the story. The Broadway Merchants' Association wants the street cars off Broadway and the Forty-second Street Property Owners' Association wants the street cars off Forty-second Street. On the other hand, property owners along exclusive Park Avenue can't see the bus for a moment. They insist they will not have their thoroughfare ruined by a bus line operated in front of their doors. Falling in with some of the ideas of the Broadway Merchants' Association, the New York Railways, still in receivership, announced on Oct. 22 that it was prepared to rip up 46 miles of line at once and to substitute buses, with possible abandonment ahead of more railway lines if events justified their replacement with buses. In general the officers of that company are in agreement with the terms for operation set down by the City Transit Board. That company proposes an interchange of transfers with the cars of its railway lines, but the Mayor sees little advantage in this particular phase of the proposal because he regards the surface lines as a dead issue. Meanwhile property owners along Third Avenue are urging the demolition of the elevated line along that street.

As if this were not enough, the passages at arms are kept up between the Mayor and the Transit Commission, a state-created body. On his part the Mayor says he will petition Governor Smith for the removal of the commission under charges of culpable negligence and malfeasance in office. He is harking back to the Brooklyn accident some months ago. This may, of course, be a pre-election gesture, but Mr. Delaney, appointed to the city Board of Transportation by the Mayor, has issued a word of warning. He says that he has always found that mere argument and assertion in support of a case are not satisfactory to any trial officer.

In reply to this Chairman George McAneny of the Transit Commission made public a thinly veiled threat that he would hold responsible under the laws against criminal libel such members of the Board of Estimate as may append their signatures to the formulated charges drawn up and presented by Mayor Hylan.

Mayor Hylan the following day called the attention of Mr. McAneny to certain provisions of the Penal Law about threatening public officials who have a duty to perform. Mr. McAneny thinks the Mayor is threatening him and the Mayor appears convinced that Mr. McAneny is threatening the city officials. There the matter rested on Oct. 22.

Major-General O'Ryan, a member of the Transit Commission, replied by radio on Oct. 20 through the city's sending station to the Mayor's recent talks about transit from the same station. The cure which the commissioner recommended for the relief of the city's transit ills was the plan advanced a year or more ago by the commission for the unification of all desirable transit lines under the centralized management of a board of control, the existing franchises to be acquired by the city and the whole unified system, though not municipally operated, to become the property of the city. This project contemplates the taking over of all necessary subway, elevated and surface lines with their consent and at a valuation fixed between them and the proper authorities. The Transit Commission many months ago held protracted public hearings on this proposal and its valuations committee made an exhaustive report upon the value of the properties concerned, which, in most instances, have been disputed by the corporations as too low.

Hundreds of years ago Plato wrote about the ideal commonwealth and More wrote his "Utopia." In the light of recent events in New York humanity does not appear to be in any immediate danger.

Increased Service Imperative

Transportation Board Urges Private Bus Operation for New York City —Says City Has No Power to Run Buses

Some of Mayor Hylan's pet transit theories are knocked into a cocked hat by a report of the Board of Transportation, appointed by the Mayor himself. The commanding features of the report, submitted on Oct. 15 by that body, are private ownership and operation of buses in New York City governed by revocable franchises, granted by the Board of Estimate and recognition that it might not be practicable to demand a 5-cent fare for all lines. All the recommendations were concurred in by the three members of the Transportation Board, Chairman John H. Delaney and Commissioners, Daniel L. Ryan and William A. DeFord.

The board recommends that the city should choose one of the larger companies instead of giving grants to a large group of small operators. The report says:

> Franchises covering comprehensive systems of routes that serve a broad extent of territory are preferable to grants authorizing disconnected short routes, and so far as practicable all routes should be designed with a view to the ultimate unification in a single comprehensive city-wide system.

On this subject the board further recommends:

> Franchises should be granted to applicants that can demonstrate financial and operating solidity so that the traveling public may be adequately served and the investing public protected from exploitations.

In its proposal for a "reasonable fare" the board says:

> Franchises should stipulate a rate of fare for a continuous ride, but the conditions attending bus operation are not identical with surface or rapid transit operations and therefore a universal 5-cent fare may not be practicable in regard to all omnibus lines.

Another salient feature which deals with the possibility of eliminating some of the existing surface lines is the following provision of the report:

> Franchises for new routes should be granted only to corporations organized specifically for the purpose of operating omnibus service, and that are subject to continued control by the franchise-granting authority of the city in respect to quality of service to be rendered. Existing street railroad franchises should not be enlarged so as to include the right to operate omnibus lines, unless long-term franchises are surrendered for new grants containing conditions similar to those to be incorporated in omnibus line franchises and providing that the city authorities will have the power to require a change from street car to omnibus operation to relieve traffic congestion.

LIMIT ON FRANCHISE TERMS

To insure eventual control of the bus lines the board declares that all franchises should embody in their terms provision that no franchise shall exceed a life of ten years; that the city reserve the right to purchase the tangible property upon a basis of valuation to be defined in the franchise-contract, when the franchise expires or is otherwise terminated, and the right of the city to control capital investments and regulate the amount and quality of service.

Other terms include audits of accounts, power to abrogate franchise if insolvency intervenes, or for failure to fulfill conditions of grants or for any change in the agreed fare.

Transfer of ownership or control or consolidation of routes is prohibited without the consent of the Board of Estimate.

Nine corporations are mentioned by the board as having proposed to establish "comprehensive systems" for which a preference is expressed. Eight of these have submitted definite plans, while the Interborough Rapid Transit Company and the New York Railways have expressed a willingness to undertake bus operation. The major applicants are:

Fifth Avenue Coach Company, Surface Transportation Company, Manhattan Bus Corporation, Service Bus Corporation, Audubon Transportation Corporation, People's Electrobus Corporation, Brooklyn-Manhattan Transit Corporation and Queens Bus Line, Inc.

The reasons for proposing recommendations as to policy are outlined by the board as follows:

> The bus is a more flexible and desirable surface transit facility than the trolley car because:
>
> A smaller capital investment, in proportion to the service rendered is required for installation.
>
> Street capacity for vehicular traffic will be increased by the ability of buses to load and discharge passengers at sidewalks without requiring other vehicles to halt.
>
> Greater safety to passengers and pedestrians will be assured.
>
> Variation of routes is always possible to avoid temporary obstruction to traffic, and better to serve the people.
>
> Rush-hour traffic can be more efficiently handled by the constant placing of equipment at the times and places where traffic is heaviest.
>
> Operations will not be slowed down or stopped if one transportation unit is disabled.
>
> Recreation facilities will be increased.

Of the 51 applications pending, 25 propose to charge a straight 5-cent fare, nine have a 10-cent fare, two ask for a combination fare of 5 and 10 cents, one recreational route asks 25 cents, another recreational route 50 cents, and 13 fail to state the fare to be charged. The applications cover practically every main thoroughfare in the city and most of the principal crosstown streets.

In the opinion of the board the imperative need is for the immediate establishment of increased service, whether to supplement rapid transit lines, to render crosstown service or furnish long-haul service.

Fares to Be Advanced in Boston

Imposition of $500,000 Additional Yearly Expenses Under Wage Award Just Announced a Serious Burden—Majority and Minority Wage Findings Reviewed at Length

BECAUSE of the award announced by the arbitration board giving the Boston Elevated Railway employees an increase in wages of 2½ cents an hour, the trustees of the company have decided to cancel all 5-cent fares in the city on Nov. 1 and install a 6-cent fare instead, except for school children, who will continue to travel for 5 cents. Five tickets will be sold for 30 cents, but the passenger who does not offer a ticket will have to pay 10 cents.

The 5-cent fare in Boston was a reduced fare, established on short runs not in real competition with the basic 10-cent fare lines. The 5-cent routes had, however, become so numerous all over the system that 1,000,000 people rode at this reduced rate last year.

The road must earn more than the extra $500,000 that the wage increase will cost, because it has been operating at a loss for three successive months. The $1,000,000 reserve fund has been completely wiped out. The net result today is that the company has a deficit of $1,200,000 to meet.

Certain additional economies will be practiced. More one-man cars will be placed in operation soon. If it is found that any of the 6-cent routes compete with the basic 10-cent fare there may be curtailment of the 6-cent routes. The 6-cent fare applies also to the company's buses.

As noted briefly in the ELECTRIC RAILWAY JOURNAL for Oct. 18, page 710. Chairman John D. McLaughlin of the board of arbitration and James H. Vahey for the union decided upon a wage of 72½ cents an hour for two-man operators, while the differential of 8 cents an hour for bus drivers and one-man car operators was continued. From these findings C. W. Mulcahy, arbitrator for the company, dissented. The opinions expressed by the arbitrators are of considerable general interest. As Messrs. McLaughlin and Vahey reviewed the matter the principal question was whether the former maximum wage, fixed by the board of arbitrators at 70 cents an hour and effective as of July 1, 1923, should be reduced to 65 cents, as the company requests, or increased to 95 cents, as the employees request, for the year ending June 30, 1925.

6,500 TO 7,000 EMPLOYEES AFFECTED

In round numbers the arbitration affects the earnings of from 6,500 to 7,000 employees, of whom half, perhaps, are motormen and conductors, the other half being engaged in miscellaneous work.

It was agreed that the board need determine only the wages of the motormen and conductors of two-men cars and that the wages of all other employees, known as miscellaneous employees, be adjusted by adding to or deducting from the hourly rates of the miscellaneous employees the number of cents per hour by which the hourly rate of the blue uniform men was increased or decreased by the arbitration.

The request of the company that the wages be reduced was supported by evidence to the effect that the basic wage, judged by all reasonable standards, was excessive, and much evidence in the way of comparative statistics was introduced to support this contention. More emphasis was placed on the present condition of the company's finances;

on the fact that in its last fiscal year, from June 30, 1923, to June 30, 1924, and beginning last December, a marked diminution has developed in its receipts from passenger traffic, resulting on June 30 of this year in what would have been a deficit of more than $140,000 were it not for the receipt of income to about this amount from other and unexpected sources, and on the present trend on the part of the public toward less riding on the cars, as shown by a decrease of more than $40,000 in receipts for September, 1924, compared with September, 1923. The comment of the majority opinion on this aspect of the case follows:

> The principle which applies to the relation between wages and the financial condition of employers, as generally stated by arbitration boards, by federal judges in receivership matters and by such authorities as Justice Higgins of the Arbitration Court of Australia and Chief Justice Taft when chairman of the War Labor Board, is, in substance, that the employee is not a partner or joint adventurer, sharing in profits and losses, and that his remuneration ought not to depend on these contingencies. Slightly paraphrasing a remark of one of these judges, "If the profits are 100 per cent, the fair and reasonable remuneration must be paid, and if the profits are nil it must be paid." It may be said, however, that the board does not adopt this principle *in toto* and without modification, as will appear in the ultimate decision of the case.

PUBLIC CONTROL ACT DISCUSSED

After discussing the provisions of the act to provide for the public operation of the Boston Elevated Railway, commonly known as the public control act and under which the board of trustees was created, the majority opinion said:

> It may be further said that under the provisions of this act, when, after a deficit has been borne by the public, receipts begin to exceed expenses the taxing district must be reimbursed for moneys advanced. But there is no provision for reimbursing employees whose wages have been cut in the process of reducing expenses, and have thus indirectly contributed toward bearing the deficit. It seems to us that so far, at least, as the facts in this case are concerned, the disparity between income and expenditure is not a reason for decreasing wages.

With respect to the claim that the wage itself is excessive, the majority opinion said that the questions as to what is a fair, just and reasonable wage can be answered only by applying "such standards or definite and accepted principles as seem plainly consonant with justice." The opinion said:

> No one would deny, we think, that the basic wage should be sufficient to enable the employee to support his family in reasonable comfort, to maintain a normal American standard of living, according to his position in life, and as established or fixed in his own locality or community, to educate his children and to lay by something for the future in the event of sickness or death. It is, however, more difficult to apply the standard than to define it.
>
> The eight-hour day is expressly recognized, as between the company and its employees, as the just, reasonable and basic period of labor, and the board is of the opinion that in fixing the wage rate only the amount received for six days' work a week should be considered. The present rate of pay as fixed by arbitration for the period from July 1, 1923, to July 1, 1924, is 70 cents an hour or $5.60 a day. It is true that the average wage earned is $5.94 a day for 6.46 average days a week. But these earnings evidently imply work in excess of the eight-hour period and six-day week, which, it must be conceded, are the fair criteria or norm of the justice of the wage. At the $5.60 rate for a day of eight hours, if we allow the employee fifty-two days as the equivalent of the Sundays of the year, and fourteen days in addition, as the equivalent of a vacation for that period, without any deduction for holidays, he will earn about $1,675 a year, provided nothing interferes in the way of sickness or other pressing necessity to require his absence from work. If, however, he must be absent from his work for a day he must lose a day's pay, because he is hired by the day and not by the year or the month. It is proper, however, to say in this connection, lest the fairness of the company as an employer be questioned, that employment with it is practically as permanent as the employee may desire; that the turnover is negligible in amount; that employees are not discharged except for cause, and that the working conditions are unexcelled in any city of the country, a manifest spirit of co-operation and mutual interest existing between the company and the men which could not but impress a disinterested observer.
>
> While we think that 75 cents an hour would under more favorable conditions constitute a just and fair basic wage, in the present circumstances, giving due consideration to the present trend of the company's income and to the large total outgo entailed by an increase of even 1 cent per hour, we are of opinion that 72½ cents an hour is a reasonable hourly wage, and we accordingly fix it in that amount.

The other questions submitted to the board of arbitration concerned "free transportation," "vacations with pay," "men called when off duty," "service car motormen," "time for reporting and turning-in," "station receivers," "one-man cars and bus-service," "pay for motormen operating trains," "guards riding between cars," "temporary changes in employment," "night work," "pay for employees not assigned," "loaning employees from one division to another," and "over-time in the department of maintenance."

Concerning the pay of employees for operation of one-man cars and bus service, the board awarded 8 cents an hour in excess of the 72½ cents an hour awarded to motormen and conductors on two-man surface cars. This is the same differential which has been in effect for the past three years.

The board denied the specific request for a vacation, as well as for free transportation.

The remaining questions affect working conditions and the opinion of the majority of the board was that such questions should so far as possible be arranged between representatives of the company and the association.

It was recommended that back pay from July 1, 1924, until date when the new rates are actually put in effect be computed at the rate of 3.55 per cent of the actual earnings of each man from July 1 to the date when the new rates begin. Payment of back pay is to be made on or before Jan. 15, 1925.

COMPANY ARBITRATOR'S DISSENTING OPINION

In the dissenting opinion of Mr. Mulcahy he said that he did not believe that the question of what is a fair and just wage should be determined in the abstract upon the basis of a theoretical budget as to how much a wage earner should have to support himself and his family according to a certain standard of living sometimes called the "American Standard," or according to one's individual ideas on the subject, without consideration of the industry involved, the conditions which it is obliged to meet, the wages paid in comparable occupations, the purchasing power of the wage as affected by changes in the cost of living, and the effect upon the other parties in interest. It seems to him that this was particularly true in the case of an essential public utility where the proper functioning of the industry was a matter of public necessity. By this he did not mean that the public may assert its interest against a particular group to deprive that group of a minimum fair living wage, but after wages have advanced beyond this minimum level it was in the interest of every one concerned, not the least of all of the employees themselves, that all these factors be considered to the end that the wage awarded might not cripple the industry or unduly restrict it in the performance of its service.

It seems to Mr. Mulcahy very plain that the imposition of the $500,000 burden which the majority award entailed was unjustified unless it could definitely be made to appear that these employees were not receiving a fair wage. It was his opinion that the men were not underpaid but, on the contrary, were well paid and were receiving on the average more than other groups engaged in comparable occupations. In his written opinion Mr. Mulcahy included a comparison to show that since December, 1914, the cost of living in Boston had advanced approximately 63 per cent, while during the same period the hourly rate of wages of the blue uniform men on the Boston system had advanced from 31½ cents to 70 cents an hour, or 124 per cent. During this period the hours of labor were reduced from nine to eight; a guarantee of a minimum pay for eight hours a day had been established; certain allowances in addition to the basic hourly rate had been increased, and the period of service required to attain the maximum rate had been reduced from six years to one. Mr. Mulcahy said that as a matter of fact the men actually worked on the average of 6.46 days a week and received an average weekly wage of $38.63 or more than $2,000 a year. He also said that a comparison of the rates of wages paid on other railways led to the conclusion that the men on the Boston system were well paid and that their wages compared favorably with those of men employed in the crafts.

He said that a year ago the wages of the Boston men were increased by a board of arbitration nearly 15 per cent so as to put them on a "fair and somewhat permanent basis," and in his opinion no changes had occurred since that time to justify an increase of the wage then awarded. In conclusion he said:

> Fully appreciating the desirability of having men well paid, it must be apparent that there is a limit beyond which a group of employees in public service cannot have wages increased without working an unjust hardship upon others. The wages of these men have been advanced step by step by successive arbitration until, in my judgment, this limit has been passed.

One-Man Cars Authorized

The City Council of Macon, Ga., has recently passed an ordinance granting the Macon Railway & Light Company the right to put into service one-man cars on all lines of the city. The permission is granted with the understanding that the city shall have full control and that if two men are required to give satisfactory service, such service will be given.

Extension of One-Man Cars Refused

The Public Utilities Commission of the District of Columbia recently refused to allow the Washington Railway & Electric Company to add ten one-man cars to those it has now in operation. The decision followed a public hearing and an inspection of the new type of rear-exit one-man cars which the company has developed. The commission took no action against the one-man cars now in use, nor does its order bar future extension. It refused the extension because it was believed that one-man cars were slower than the two-men type, that the presence of the conductor meant increased protection for the riding public and greater assistance to individual riders and because there was no unusual emergency confronting the railway company at this time.

An intimation that higher fare might be asked for if one-man cars were ruled out of use was made by William F. Ham, president of the Washington Railway & Electric Company, at a recent public hearing.

Mr. Ham presented testimony to show that street car traffic is falling off rapidly on the lines of both the Washington Railway & Electric Company and Capital Traction Company. Mr. Ham said:

> I should prefer not to have to raise the rate. Whether that is possible or not I don't know. The loss of traffic has been beyond our expectations, and if it continues something is going to happen. If the commission and the public do not sustain us in trying to operate as economically as possible, I presume an increase in fare will have to be asked.

Atlanta's Jitneys Scored

The revenue figures of the Georgia Railway & Power Company, Atlanta, Ga., for the month of September fell off $47,000 compared with revenues for September, 1923. The report of the company charged this decrease in revenue to unregulated jitney bus operation and added that "continued operation of the street cars is in serious jeopardy and something must be done immediately to save the city's transportation system."

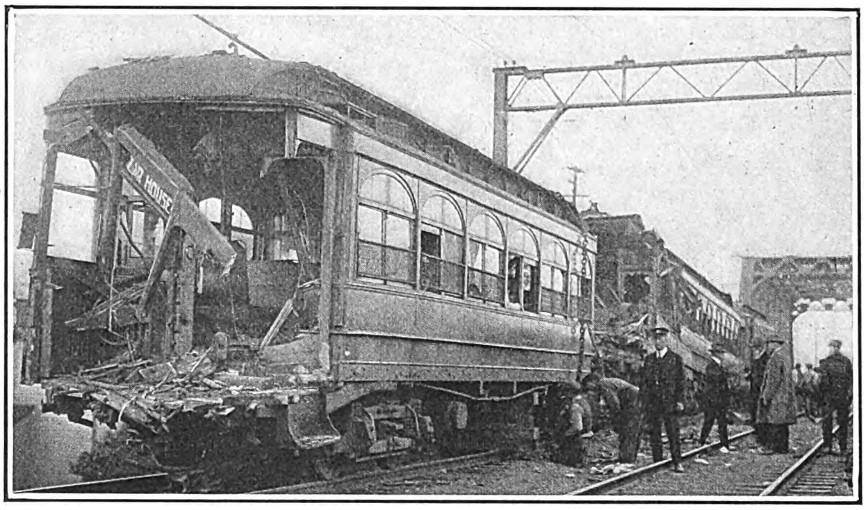
Simultaneously with the giving out of the September report the Atlanta Federation of Trade Committees issued a report following a special investigation declaring that property and rights of individuals must receive just protection and that the only position from which to view the subject was that of an adequate transportation system for Atlanta; that the jitneys do not and cannot furnish adequate transportation, but that the jitneys are meeting a need of some of the people. The committee concluded that the railway should be allowed to make a fair return on its investment and that jitney traffic should be regulated to meet the needs of those people whom the street cars are not serving. The committee stated that if the trolley cars were to run there should be the necessary protection to enable them to run at a reasonable profit after adequate maintenance expenses had been paid.

Chairman Ashley of the Federation of Trades investigating committee, brought out figures to show that in January, 1923, there were 125 jitneys licensed in Atlanta and that during that month the railway's earnings had been $12,000 in excess of the similar month the previous year. In July, 1924, the number of jitneys operating in Atlanta had increased to 362 and the earnings of the company for the month were $38,000 under the same period for the year before.

Serious Accident on Buffalo-Niagara Falls Line

Three passengers were killed, at least a score mortally injured and almost 100 were seriously injured in a rear-end collision on the Buffalo-Niagara Falls high-speed line division of the International Railway at Ellicott Creek crossing at Tonawanda, N. Y., on Oct. 19.

The three-car trains were running as the first two of two sections of an excursion carrying passengers from Philadelphia and New Jersey points between Niagara Falls and Buffalo. The six cars were demolished on a 20-ft. embankment near the bridge over Ellicott Creek.



Employees of International Railway Engaged in Clearing Away Wreckage Caused by Collision of Cars

The first section of the series of three-car trains had come to a stop because of trouble with the trolley pole. The second section was rolling along 5 minutes behind the first train with the other sections following at close intervals. The collision telescoped the second and third cars in the first section and the first car in the second section, but none of the cars plunged down the 20-ft. embankment near the creek. It took almost eight hours to clear the wreckage.

The dying and injured were removed to Buffalo and Tonawanda hospitals in more than a score of ambulances and private automobiles.

Five separate investigations are being made to determine the cause of the collision. It was believed by state police that no flagman had been sent back from the first section to stop the onrushing second section. The motorman of the second section was seriously injured, but before he lapsed into unconsciousness he told company officials he did not see the stalled first section until he was too close to bring his train to a stop. The brakes of the second section had been set.

Owing to the heavy traffic Sunday on the Buffalo-Niagara Falls high-speed line, the International Railway was using the old type wooden coaches for the Philadelphia-New Jersey excursion special. The heavy all-steel cars were being used for the regular traffic. Although the wreck occurred at 1:10 o'clock in the afternoon the sharp turn in the high speed right-of-way near the point of the fatality prevented the motorman of the second three-car train from seeing objects any great distance ahead.

Governor Wants Quick Action on P. R. T. Valuation Case

The Pennsylvania Public Service Commission was recently asked in a letter from Governor Pinchot to speed its investigation of the Philadelphia Rapid Transit Company's fare case. In his communication to W. D. B. Ainey, chairman of the commission, the Governor pointed out that three weeks had elapsed since the chairman replied to the Governor's criticism of the commission's "unseemly haste" in handling the rate matter, but that so far the Attorney-General had not been asked for an opinion.

The Governor suggests that the Public Service Comission will ask the opinion of the Attorney-General right away on three points: First, whether the commission is bound in regard to valuation in the P. R. T. case by its decision of June 21, 1923; second, whether the commission is not required by the law and the decisions of the courts to reopen and consider anew from the beginning the whole question of the P. R. T. valuation, and, third, whether the commission is in any sense bound by the admissions of the counsel for the city of Philadelphia, or other complainants, concerning the valuation of the P. R. T., or whether, on the contrary, it is not required, while giving due weight to all evidence submitted, to reach its own conclusions upon the basis of its own investigations.

News Notes

Exclusive Bus Right Sought in Indianapolis.—A franchise which would exclude all other bus lines from the use of 53 principal Indianapolis streets and boulevards for a period of 25 years will be sought of the Board of Public Works and the City Council by the Indianapolis Motorbus Terminal Realty Company. This company is said to be a holding company for the Indianapolis Motorbus Terminal Company, an association comprising about 18 bus firms. An unsigned copy of the proposed franchise was left in the offices of the city legal department. It was submitted to the Board of Public Works on Oct. 13 by William Bosson, city attorney, who asked for instructions as to its disposition.

Universal Transfers in Wilmington.—Under traffic arrangements with the Tidewater Power Company a new type of transportation service operated by the Coast City Transportation Company will be inaugurated in Wilmington, N. C. Free transfers will be issued from the Coast City Transportation Company's buses to the street cars and exchange tickets will be issued from the street cars to the buses on payment of 3 cents extra. The buses have a seating capacity of 16 passengers. The chassis is built by Graham Brothers, with a Dodge engine and bodies by the Straton Bliss Company. It will require two buses to maintain a 20-minute schedule. The third bus will be kept in reserve, and also will be operated during periods of heavy traffic. One of the noteworthy facts concerning the line is that it will go out of its regular path morning and evening for two or three trips in order to take care of the high school children.

Greenville System Expands.—The Southern Public Utilities Company recently began operating a bus line in Greenville, S. C., following authorization by the City Council. The line will serve the northern section of the city not heretofore supplied with transportation service. The fare on the bus is 10 cents and free transfers will be given to all lines of the railway system. A charge of 3 cents will be made for transfers from the trolleys to the bus.

P. R. T. Wants to Operate Over Bridge.—At a meeting on Oct. 17 of the Delaware River Bridge Joint Commission, the Philadelphia Rapid Transit Company and a Camden Bus Company made franchise proposals to operate cars or buses across the bridge. The Continental Coach Company, Camden, also indicated by letter its interest in the transportation over the bridge, but made no definite offer. The P. R. T. franchise proposal was signed by Ralph T. Senter, vice-president. It said that the rapid progress in the construction of the bridge made it imperative that arrangements for carrying passengers over it should be determined upon promptly. A committee will be appointed to study the transit needs of the bridge.

Terminal Plans Announced.—A vast improvement program to be undertaken within the next year jointly by the Pennsylvania Railroad, the Philadelphia Rapid Transit Company and the city of Philadelphia was announced recently by Gen. W. W. Atterbury, vice-president of the Pennsylvania Railroad. The plans call for the construction of a passenger station west of the Schuylkill, which will mean the elimination of the present Broad Street Station, and the substitution of an underground station for suburban traffic. The plan calls for modern construction throughout, with eighteen terminal tracks for through trains and eight tracks for suburban trains. The railroad will electrify the suburban zones as far south as Wilmington and eventually portions of the New York and Schuylkill Valley divisions. General Atterbury intimated that electrification to Baltimore and Washington was also in sight. The city's share is put at $12,000,000. It is planned to start the work next year and to finish it at the end of five years.

Will Renew Wage Agreement.—The Boston & Worcester Street Railway carmen's union, which recently took a poll on the wage question, has voted to accept the offer of the company and renew the wage agreement in effect since Oct. 1, 1923. The demands called for a wage of 90 cents an hour and an eight-hour day. The first local voted to submit the issue to arbitration and arbiters had been chosen by both sides. The company primarily wanted to eliminate the 7 cents an hour extra paid one-man car operators. Subsequently, the company offered to renew the wage scale and working conditions as of the period up to Oct. 1 of the present year. The wage scale accepted provides for 58 cents an hour for motormen and conductors on two-man cars and 65 cents an hour for men on one-man cars, on a nine-hour-day basis.

Relieved from Paving. — The Virginia Corporation Commission recently handed down a decision allowing the Newport News & Hampton Railway, Gas & Electric Company to discontinue its tracks along Locust Street from Queen Street to Malloy Avenue in Newport News. It also suspended the payment of the paving obligations assessed against the company for Locust Street by the City Council until "such time as the company is operating its lines at a profit." The company was also allowed to abandon its tracks from Wood's Corner in Elizabeth City County to Buckroe Beach, but it is required to operate the car service from Wood's Corner through East Hampton into the city.

Wants Buses Off Car Streets.—Arthur Gillion of South Bend, attorney for the Chicago, South Bend & Northern Indiana Railway, has conferred with Michigan City officials in regard to enforcing a city ordinance which says buses shall not run on streets on which the street cars operate. The Jahns Bus Company, which operates from Michigan City, Ind., to South Bend, via Laporte, would be affected by the strict enforcement of the measure.

Combination Service for East St. Louis.—G. W. Welsh of the East St. Louis Railway, East St. Louis, Ill., which has applied to the St. Louis Board of Public Service for a permit to operate buses over the St. Louis Municipal Bridge, states that his company will furnish a 15-cent combination street car and bus service from any part of East St. Louis to downtown St. Louis. Permission to operate a bus line along Tenth Street in East St. Louis from Missouri Avenue to the bridge has already been obtained from the East St. Louis City Commission and the Illinois Commerce Commission. The fare across the bridge will be 10 cents with an additional 5-cent charge if the rider wants to proceed further into East St. Louis. Along Tenth Street the charge will be the same as on the East St. Louis car lines, including transfers.

Appropriation for City Survey.—The St. Louis, Mo., Board of Estimate and Apportionment has appropriated $12,500 for a survey of the city transportation needs. An additional $12,500 for this purpose will be included in next year's municipal budget. C. E. Smith, consulting engineer for the city, in urging the appropriation pointed out that the United Railways will shortly ask for a new franchise and the city should be prepared to deal with the company.

Bus Permit Under Consideration.—The Board of Public Utility Commissioners of New Jersey has reserved decision on an application by the Central Transportation Company, a subsidiary of the Trenton & Mercer County Traction Corporation, to operate two buses from Trenton, Asbury Park and Bay Head. The Coast Cities Railway, operating both trolley cars and buses, objected to the approval, claiming that the Trenton company should not be allowed to compete with it among the shore resorts.

Competition to Be Eliminated.—The New Albany, Ind., City Council recently adopted an ordinance eliminating bus competition from the railway lines of the Interstate Public Service Company. A special committee to which the measure had been referred reported that after a thorough investigation the committee decided that the city could not support a bus service and the railway service and that the railway service was more essential to the public than the service of buses.

Bus Line Planned.—The Williamsport Passenger Railway, Williamsport, Pa., is planning to operate a bus line to connect with trolley cars of the South Williamsport division, to Duboistown, to connect with Newberry cars at the postoffice, or to connect with Third Street cars. The three plans are possible, the company to accede to the wishes of patrons on each route. L. W. Heath, general manager of the company, announces that application will be made at once to the State Public Service Commission for a certificate of public convenience. Service is contemplated before the first of the year. The bus route was promised following the company's announcement that the finances were not great enough to build a trolley extension on West Third Street over the Newberry-Duboistown bridge.

Financial and Corporate

Receivership Deferred

Application for Receivers for Oklahoma Railway Continued Until January —President Reviews Situation

For the present at least the prospect of the appointment of receivers for the Oklahoma Railway no longer impends. This does not mean that the problems of the company have been solved, but rather that a start has been made on a course which gives promise for the future. In consequence the application made on behalf of the Mississippi Valley Trust Company by its attorneys for the appointment of receivers for the railway has been continued by the court until Jan. 15, 1925. Meanwhile the company will go along under the new 8-cent cash fare with two tickets for 15 cents and the other changes noted in the ELECTRIC RAILWAY JOURNAL for Oct. 11, page 665. The previous rate had been 7 cents with four tickets for 25 cents.

The entire controversy was reviewed at length by John W. Shartel, president of the railway, in the issue of the Oklahoma *News* for Sept. 29 in an article written before announcement had been made of the decision to permit the fare increase. He would prefer to run the lines on a 5-cent fare, but it could not be done successfully. He said he had no disposition to extort anything from his patrons and that his past record bore out this statement. His remarks show that on Oct. 1, 1923, the cash investment in the interurban lines was $3,031,416. The gross revenue of the interurbans for the first eight months of the year was $421,941. Operating expenses and taxes were $320,458. Gross earnings for the eight-month period were $101,483. The falling off in their receipts has been alarming this year.

In regard to the city lines, they are operating at a distinct loss. City operations proper for the first eight months of 1924 show that the gross revenue was $533,960. Operating expenses and taxes were $447,387. The gross income, above operating expenses and taxes, was $86,573. Fixed charges were $167,526. The deficit on city operations for the eight-month period was $80,963. In other words, the city lines lacked $80,000 of meeting their actual expenses, to say nothing of depreciation, dividends, or paying for necessary repairs or forced improvements.

Mr. Shartel said very frankly that in order to meet this deficit it was found necessary grossly to overcharge the interurbans to furnish current funds to live on day by day.

For 1923, the interurbans paid the city lines $99,111 for passenger fares, for which nothing but power and tracks were furnished. This amounts to 30 cents per car-mile or more than the Belle Isle and Capitol Hill street cars earn.

The interurban also operates at its own expense the suburban line from Needham to Britton, and turns over to the city lines all of the earnings between Needham and Belle Isle.

The city lines also receive their mileage pro rata on all mail, express, baggage and freight. These items alone amount to $48,637, making a total of $147,748 which the interurbans contributed to the city lines in 1923.

This rental is more than 150 per cent more than the customary rental charged by city lines for use of tracks to interurbans with which they are not associated.

This is the basis of charge by the city lines, and the same is in effect for 1924, except the proportion is slightly larger, due to the fact that there is a greater decrease in volume of business on the city lines than there has been on the interurbans.

September Operations Increase Deficit in Toledo Fund

Operations of the Community Traction Company, Toledo, Ohio, for September showed a loss of $45,654 despite operating economies amounting to nearly $38,000 and some increased revenue due to recent fare increases. The total deficit in the stabilizing fund is now $123,000 plus the orginal $400,000 in the fund. Gross revenue for September was $269,007, as compared with $301,421 for the same month last year. Operating expenses were $222,519. Actual operating cost, exclusive of extraordinary maintenance, was $194,194, as compared with $246,331 for the similar month last year. Cost of transportation was cut to $95,543, or 18.036 cents per car-mile, which is the lowest total cost for any month. This is largely due to the extended use of one-man cars and elimination of an unprofitable line.

During the last month, the report of acting Commissioner E. L. Graumlich shows, car riding dropped to its lowest point since the Milner ordinance has been in effect. The daily average was 114,383 revenue passengers. Factory unemployment, bus competition, increased use of private automobiles and the increased fare are cited as contributing causes.

During the first nine months of the year $105,000 has been set up as extraordinary maintenance to take care of renewals on the Cherry and Summit Street lines. There is a cash credit in this fund and the regular maintenance fund of $79,535 ready for the work, which will probably not go forward until next spring.

The Community Traction Company is not now earning the interest on its $7,178,000 of first mortgage bonds outstanding and will probably have to borrow money to pay the interest coupons due in January.

So far in October a gain in revenue has been shown with the first 14 days about $8,000 ahead of last month.

$50,000,000 Gross for Canada

Record Earnings, but Net Shows Decline Due to Tax Burden, Expenditures for Improvements and Bus Competition

For the first time the electric railways of Canada in 1923 had a gross income of more than $50,000,000. Despite this fact, however, the roads were unable to show better dividends for shareholders, or, in the case of publicly-owned roads, to return better surpluses to the citizens. Factors that worked against the companies were the increasing tax burden and the necessity of spending millions on new equipment and extensions that increased interest charges without increasing revenues in the same proportion.

Of 64 railways only nine paid dividends. However, 20 Canadian roads are publicly owned. Of the 64 companies 15 showed operating deficits, and, after paying all charges, 40 showed corporate deficits.

USE OF ONE-MAN CARS GROWING

According to the annual report of the Dominion Bureau of Statistics, one-man cars are coming into quite common use. In fact, more than one-tenth of the 5,000 street cars in Canada are one-man cars.

Comparative figures of income and deductions of Canadian street railway systems are given for two years past:

	1922	1923
Earnings and Income:		
Gross earn. from operations	$49,660,485	$50,191,387
Operating expenses	35,986,871	36,171,922
Net operating revenue	13,673,513	14,019,464
Miscellaneous income	4,195,536	3,940,663
Total corporate income	17,869,149	17,960,128
Deductions from Income:		
Taxes	1,730,718	1,958,045
Interest—funded debt	6,545,825	6,765,078
Interest—floating debt	816,406	1,094,822
Other deductions	1,467,251	1,776,176
Total deductions	10,560,202	11,594,122
Total net income	7,308,947	6,366,005
Deductions from Net Income:		
Reserves, etc	4,664,822	4,589,081
Dividends	2,554,567	2,322,561
Total	7,219,389	6,911,643
Deficit	*$89,557	$545,637

* Surplus.

In commenting on these results the *Canadian Financial Post* says that in the operation of suburban lines, particularly around large urban centers, the bus has grown to be an important factor. This is particularly true around Toronto, where the buses compete with Hydro Radials. Recently a new tariff of license fees has been put into force by the Ontario Works Department. The contention is that the buses are using the provincial highways for gain and should pay adequate fees. The bus men claim that the tax levied is such that it will force them out of business. They say that it is not an equitable tax, inasmuch as it is not on the same basis for all bus lines, and contend that the buses in direct competition with Hydro Radials are being taxed so high and in such an arbitrary manner as to prevent them giving adequate service.

Alabama Traction Deal Approved

Stockholders of the Alabama Traction, Light & Power Company have approved the sale of the common stock and other securities which it owned in the Alabama Power Company to the Southeastern Power & Light Company, the American company recently organized for the purpose of taking over those holdings.

In a statement issued by Thomas W. Martin, president of the Alabama Power Company, it is explained that under the plan the common and preferred stock of the Canadian company will be converted into the common and preferred of the American company. The new company assumes the payment of all the obligations of the Canadian company, including the interest on the bonds at maturity. It was said that about 90 per cent of the common stock of the traction company is now owned by American citizens.

Will Foreclose Mortgage Against Titusville Property

Announcement was recently made that the holders of the bonds and mortgage against the property of the Titusville Traction Company, Titusville, Pa., have decided to foreclose. Without formal court proceedings the property will be advertised at trustees' sale. No interest has been paid on first mortgage bonds since January, 1920, nor on second mortgage bonds for the past ten years. The company, because of the increasing use of the automobile, has been unable to keep up the business. Recently only one car has been operated and that over the line between Pleasantville and Hydetown.

The line is 16 miles long. It was organized 27 years ago by the late M. B. Dunham, Warren. The first section of the line was built between Titusville and Pleasantville.

Illinois Farmers Do the Trick

After six weeks of operation in the control of 300 farmer-owners, the Fox & Illinois Union Railway, in Illinois, has announced a net profit of $24,000. The sharp contrast of the $8.40 gross profit for the first seven months of 1924 as shown by the Illinois Commerce Commission brought out the source of the recent big income as a $23,000 contract for power lines along the right-of-way.

For its entire life of eleven years the road has been a losing proposition, and when the farmers took it over recently for $89,000 they did so to keep it from being junked. They paid $25,000 cash, raised by an assessment of $2.50 for each acre owned by the farmers it served. It is the only freight outlet for five co-operative grain elevators owned by the same farmers, and although the junk value was placed at $117,000, the former owners took the farmers' bid as the best of several submitted.

The power right-of-way was sold to the Public Service Company of Northern Illinois, an Insull corporation. Mr. Insull agreed to receipt a bill for $8,000 for power, assumed in the purchase, and to pay $15,000 cash.

The line is 21 miles long yet passes through no incorporated town or village. The 300 owners have agreed to pay ½ cent bonus for each bushel of grain they ship, in the hope that the line can be extended 9 miles into the untapped Millington, Ill., district, where a large silica sand bed awaits development. The grain bonus will bring in $10,000 a year.

Pennsylvania Line to Be Sold at Auction

The trolley road of the Pennsylvania & New Jersey Traction Company, running from Morrisville, Pa., to New Hope, Pa., and Lambertville, N. J., will be sold at public auction on Nov. 17, in Philadelphia, to satisfy a claim for interest on a mortgage for $200,000. The mortgage is held by the Northern Trust Company, Philadelphia. The traction company is charged with default in payment of interest on the mortgage for 90 days. The sale will also include rolling stock consisting of five passenger cars, one freight car, three work cars, two snow plows and parcels of land in New Hope and Newtown. Cars are still running between Trenton and Morrisville, Pa., and Yardley, Pa., and from Trenton to Princeton, N. J.

Hearing Begun on Suit to Compel Eastern Massachusetts Dividend Payments

The case of L. Sherman Adams against the trustees of the Eastern Massachusetts Street Railway, Boston, Mass., to compel the payment of dividends on adjustment and common shares is on trial before Hon. Frederic H. Chase as master. In opening the case Boyd B. Jones, attorney for the plaintiff, outlined the claim of the plaintiff and referred to the books kept by the defendants and their reports to the Public Service Commission in their answers to interrogatories filed to them in the case. These, Mr. Jones asserted, abundantly supported the plaintiff's contentions.

Caleb S. Jackson, vice-president and treasurer of the railway, said that personally he did not believe the trustees had a legal right to resort to reserve fund for payment of dividends. He was not sure whether the matter of applying the reserve to this purpose was discussed at the time of making up the answer to an interrogatory in which the trustees said they had paid such dividends as had been earned, nor could he recall whether said trustees in January, 1923, when dividends on preferred and sinking fund stocks were decided upon, discussed such application of the reserve fund. The trustees did, however, discuss resorting to the reserve fund to pay dividends at various times.

Some time in September, 1922, the fund first appeared on the company's books. Mr. Jackson himself created this fund with the approval of the trustees. Some of the latter were decidedly of the opinion that the reserve fund was not applicable to the payment of dividends. It was the general opinion of the trustees that dividends on preferred and common stocks were included in cost of service. In substance, the trustees knew the fund was applicable to meet deficiencies in income in order to cover the cost of operation.

Mr. Adams is a Boston dealer in investment securities. He has on several occasions recommended the purchase of Eastern Massachusetts securities to investors.

Conspectus of Indexes for October, 1924

Compiled for Publication in this Paper

*The three index numbers marked with an asterisk are computed by Mr. Richey, as follows: Fares index is average street railway fare in all United States cities with a population of 50,000 or over except New York City, and weighted according to population.

Street Railway Materials index is relative average price of materials (including fuel) used in street railway operation and maintenance, weighted according to average use of such materials. Wages index is relative average maximum hourly wage of motormen and conductors on 105 street and interurban railways in the United States, operating more than 100 passenger cars each, and weighted according to number of cars.

Albany Southern Railroad Changes Name

The rearrangement of the capital structure of the Albany Southern Railroad, Albany, N. Y., and a change of name to the Eastern New York Utilities Corporation has been decided upon by the directors and approved by the stockholders. New financing of a comparatively small amount is contemplated by the sale to stockholders of a new prior preference stock of no par value which has just been authorized and issued.

The new stock has been authorized in the amount of 25,000 shares, to have preference over the existing common and preferred stocks, but only 3,000 shares of the issue is to be sold at this time. Stockholders of record, Oct. 18, will be permitted to subscribe for the new prior preference shares at $95 a share in the ratio of 8.814 per cent of the present holdings. The proceeds of the sale of stock will be used to pay floating indebtedness incurred for extensions, additions and betterments and to pay for further capital improvements.

The company operates 60.9 miles of third-rail railway and does a general power and lighting business.

Maumee Valley Line Will Be Abandoned

The Maumee Valley Railway, Perrysburg, Ohio, now in the hands of Receiver B. A. Webster, has been granted permission by the State Public Utilities Commission to abandon its lines. The west side line to Maumee will be abandoned at once and the east side line to Perrysburg will cease operating as soon as the new bus equipment of the Maumee Valley Transportation Company can be put into service. There were $345,000 of first mortgage bonds outstanding against the railway property.

The same interests have formed the new bus company to take the place of the former belt line railway. The commission has authorized the new bus line to do business on the east side of the river, but has withheld a certificate of convenience and necessity for the line on the west side because of present competition between bus lines already operating there and the Toledo, Bowling Green & Southern Traction Company's line.

Abandonment of Routes Approved by City.—Permission for the Oklahoma Union Railway, Oklahoma City, to surrender franchises for the Forest Park and Fife Place lines has been given by the City Council, subject to the approval of the Corporation Commission.

Personnel of Common Stock Committee Announced.—Howard Cook, Jefferson City, Mo., vice-president of the Central Missouri Trust Company, has been named by the holders of the common stock of the United Railways, St. Louis, as a member of a committee to represent the stockholders in negotiations with New York financial interests engaged in managing the present reorganization. The committee named consisted of Judge Fred L. English, Edward C. Singleton, president of the Missouri State Life Insurance Company, and Mr. Cook, with the Mercantile Trust Company, St. Louis, as depository. This committee has been named by virtue of an agreement among the holders of this stock to organize and vest all of their privileges and powers as stockholders in the committee for the protection of the interests of the holders. The common stock consists of 249,130 shares, a large portion of which is owned by the North American Company.

Approval of Refunding Issue Is Sought.—The Twin City Rapid Transit Company, Minneapolis, Minn., was authorized recently by the Railroad & Warehouse Commission to have its subsidiary, the Minneapolis Street Railway, issue $5,000,000 of 5½ per cent refunding notes to be dated Nov. 1, 1924, and due Aug. 15, 1928, to redeem $5,000,000 of extended first mortgage bonds issued jointly by the Minneapolis Street Railway and the Minneapolis, Lyndale & Minnetonka Railroad. As noted in the ELECTRIC RAILWAY JOURNAL for Oct. 18, page 715, the issue was recently sold to Dillon, Read & Company, New York.

Long Island Property Will Be Auctioned.—Property of the New York & North Shore Traction Company will be sold at auction Oct. 29 at the company's carhouse in Flushing, L. I. Several years ago the company operated between Flushing and Whitestone, Bayside and points in Nassau. The power plant and machinery at Douglaston, the carhouse in Flushing, private rights-of-way in a plot of ground in Whitestone will be disposed of.

Purchase Negotiations Considered.—A basis to negotiate either for the purchase of the Hamilton Street Railway System, Hamilton, Ont., or the renewal of its franchise was reached at a conference recently between officials of the city and of the company. No proposals were set forth by either group. All the city asked for was a definite proposal from the company so that the question might be submitted to the rate payers at the forthcoming municipal elections.

Vote to Take Over Company.—Stockholders of the Chicago, North Shore & Milwaukee Railroad, Chicago, Ill., at a recent meeting voted to take over the Chicago, North Shore & Northern Railroad. The latter company was organized to construct the extension line between the right of way of the Chicago Rapid Transit Company and Niles Center, a distance of 5½ miles. The capitalization of the Chicago, North Shore & Northern was nominal.

Allowed to Abandon Passenger Service.—The California Railroad Commission has granted permission to the Visalia Electric Railroad to discontinue passenger train service from Visalia, Woodlake and Elderwood via Exeter and Lemon Cove, Tulare County. The company showed an operating loss of $50,000 a year for several years.

Wants to Abandon an Interurban Line.—The Olean, Bradford & Salamanca Railway has applied to the New York Public Service Commission for permission to abandon its interurban division between Salamanca and Little Valley, a distance of 8 miles. The company says the line cannot be operated at a profit. The commission will hear the application at Hornell, N. Y.

Sale of Power House Reported.—The sale of the Holyoke Street Railway power house on the bank of the Connecticut River near the Berkshire Street grounds at Holyoke, Mass., to the Turners Falls Power & Electric Company is said to have been definitely arranged. The transaction means a reported saving of about $50,000 to the railway in operating expenses. It is also said to mean the purchase of power for railway purposes from the Turners Falls Company.

Line Being Dismantled.—The Alamance Street Railway, Burlington, N. C., has abandoned operation and is now being dismantled. Early in the present year J. H. Bridges was appointed receiver as a result of defaulted payment of interest on $120,000 in bonds held by the petitioner. The receivership order was signed by Federal Judge E. Yates Webb on petition of the American Trust Company of Richmond, Va. At that time the receiver was authorized to continue the operation of the line connecting Burlington, Graham and Haw River. The railway is 8 miles long.

Properties Purchased.—The Public Utilities Commission has authorized the Ohio Public Service Company, Cleveland, to purchase the properties of the Sandusky Gas & Electric Company, the Port Clinton Electric Light & Power Company, the Northwestern Ohio Railway & Power Company and the Central Ohio Gas Company for $13,725,000, subject to present incumbrances. The commission also authorized the Ohio Public Service Company to issue $4,800,000 of 7 per cent preferred stock, $2,525,000 of common, $8,000,000 of 5 per cent first mortgage bonds and $1,000,000 of 5 per cent mortgage bonds.

$200,000 Verdict Against Denver Tramway.—The United States Court of Appeals sustained the city of Denver in its effort to collect approximately $200,000 from the Denver Tramway, money owed the city as a franchise tax. When the city sought to collect the tramway presented a signed agreement by the former Mayor of Denver that the city would allow the tramway $50,000 for the work it would do on the new viaduct at Sixteenth Street. It is understood that the $50,000 deduction from the taxes owed will cover labor and material as used by the tramway. If that be true, then the tramway gets the right-of-way over the viaduct and pays nothing toward the construction. The use of the viaduct by the tramway is essential to safe and fast operation.

Describes Property's Progress.—H. M. Byllesby & Company, Chicago, Ill., has issued an illustrative pamphlet describing the extent and growth of the properties of the Standard Gas & Electric Company and telling of its advantages as a utility investment. A map is included showing the territory served with electric lines, hydro-electric plants, telephone lines and electric railway service.

Personal Items

F. A. Cummings Vice-President

Former Newspaper Man Appointed to Executive Office with the Eastern Massachusetts Street Railway

Fred A. Cummings, who left the Boston newspaper field in 1919, to become public relations representative for the Eastern Massachusetts Street Railway, Boston, Mass., has been appointed a vice-president of the company. Since September last year he has been assistant to the chairman of the public trustees.

As just indicated, Mr. Cummings was formerly a newspaper man. In recent years it seems almost to have become the fashion for newspaper men to go into electric railway work just as in the past they have gone into other callings, particularly banking. Offhand, a score or more of similar instances are recalled. Notable among them are the cases of Fred Buffe, J. V. Sullivan, Ross Schram, J. W. Colton, John L. O'Toole and Paul Shoup. As journalists, all of these men know that you cannot live on yesterday's reputation. If your star is to continue high in the firmament you must be constantly up and doing.

What is the answer to the success that usually attends the newspaper man who enters another calling? Perhaps more than anything else it is the lesson of loyalty that he early learns. Certainly if there is any department of life in which the proverb "a good name is rather to be chosen than great riches," it is in newspaper work. It was H. H. Kohlsaat, former publisher of the Chicago *Record-Herald*, who died a few days ago, leaving the impress of his personality indelibly written on the pages of the history of American journalism, who said: "There is no place in journalism for the man who would break a confidence." Newspaper men err, but never guiltily.

Mr. Cummings entered railway work steeped in the ethics of journalism. He was formerly a special writer on the Boston *Globe* and before that was a member of the staff of the Lynn *Item*. He knew the state of the public mind, and so when the work of rehabilitating the road was begun his help and advice were sought. The Boston *Herald* once said that when the new era of railway management arrived in the Eastern Massachusetts Street Railway under public control the men selected to rehabilitate the property "looked around for a man who had spent his years finding fault with the system and they naturally turned toward Cummings." That is only partially true.

Anyway, Fred Cummings entered upon his work with all the fealty that is the newspaper man's. He told the trustees what he thought and he told the public what he thought. The public and the trustees winced in turn. There is one thing about it. Fred Cummings is progressive. And he is militant. More than one local politician has been brought down impaled upon the winged words of the man who knows bunk when he hears it and isn't afraid publicly to call a spade a spade.

Fred Cummings has worked unremittingly to have the railroad serve the best interests of the people who pay the fares, and to have the people cooperate with the trustees. As a result he has absorbed since 1919 a wide fund of knowledge of other departments from the intimate contacts which he has had to preserve with them, and so he goes into his new post not technically trained in the engineering sense, but with a far richer fund of all-around experience than it is often possible for the technically trained man to acquire in a similar length of time. In addition he is fortified with a keen recognition of the broad problems which the executive is constantly being called upon to meet.

Frank I. Hardy has resigned as manager of the Chelsea District of the Eastern Massachusetts Street Railway, Boston, Mass., to accept a position with the Boston & Maine Railroad. Mr. Hardy has been connected with the Eastern Massachusetts Street Railway since 1919. At that time he succeeded Timothy A. Donohue in charge of the Salem division. Mr. Hardy has been in the electric railway business since 1900. He has in the past been connected with the Union Traction Company of Indiana, the Fort Wayne & Northern Indiana Traction Company, the Chicago, South Bend & Northern Indiana Railway and the Southern Michigan Railway. He was also at one time general superintendent of railways of the Northern Ohio Traction & Light Company, Akron, Ohio.

F. J. O'Donoghue, manager of the Haverhill Division of the Eastern Massachusetts Street Railway, Boston, Mass., has been transferred to manage the Lowell Division. The duties of Garfield S. Chase, manager of the Lawrence Division, will be extended to include jurisdiction over the Haverhill Division.

Maurice E. McCormick, manager of the Lowell Division of the Eastern Massachusetts Street Railway, Boston, Mass., has been promoted to the position of manager of the Chelsea Division, including jurisdiction over the Melrose-Woburn Division.

George H. Whitfield has accepted the position of director of public utilities of Richmond, Va., succeeding E. W. Trafford who has served in that capacity since 1919. Mr. Whitfield is well known in Richmond, having served as engineer for the Virginia Railway & Power Company during the reorganization period in 1902. He was serving as engineer of the New Jersey Department of Institutions and Agencies when he received the present appointment.

H. F. Fritch Joins Boston & Maine Railroad

Howard F. Fritch, assistant general manager of the Eastern Massachusetts Street Railway, Boston, Mass., has been appointed assistant to Homer Loring, chairman of the executive committee of the Boston & Maine Railroad. It was Mr. Loring who was mainly responsible for the successful rehabilitation of the Eastern Massachusetts property and in that work, under him, Mr. Fritch took no small part. While the Boston & Maine is primarily a steam railroad the system does embrace a number of important electric railway properties and several bus lines.

Mr. Fritch has been connected with the Eastern Massachusetts Street Railway and its constituent companies since 1910. In June that year he entered the employ of the Boston & Northern Street Railway, one of the underlying companies that later went to form the Bay State Street Railway, the forerunner of the Eastern Massachusetts Street Railway. His first work was in the time-table department, then being organized. The scope of this department was later enlarged to include traffic studies and the compilation of statistics in connection with labor matters and fare cases.

For several years Mr. Fritch was assistant in active charge of the department, and in 1916 was placed in charge as superintendent of the traffic department. With the formation of the Eastern Massachusetts Street Railway he was made assistant general manager in charge of transportation. Then was evolved the plan of separating the system into units, each to be self-contained, with a local district manager in charge. In the capacity of assistant general manager Mr. Fritch worked in close co-operation with the managers of the several self-contained local units so as to make each of them successful under the conditions that obtained in its particular locality.

Mr. Fritch was graduated from the Worcester Polytechnic Institute in electrical engineering, class of 1910. He was born on Sept. 24, 1888.

New Head of Canadian Suburban Electrics

D. E. Galloway has been appointed assistant vice-president in charge of a number of suburban electric lines of the Canadian National Railways. Mr. Galloway is a native of Hamilton, Ont., and joined the Grand Trunk Railway in a clerical capacity in that city in 1901. He later served in various clerical positions in Montreal until June 1, 1906, when he became private secretary to the second vice-president and general manager. In 1911 Mr. Galloway was appointed assistant to the president and became assistant vice-president in 1922. When Sir Henry Thornton assumed his duties as chairman and president of the Canadian National Railways, Mr. Galloway was appointed chief assistant to the president. The companies which will come under Mr. Galloway's charge serve a large territory in the neighborhood of Montreal and Toronto.

Improvements Planned

Program of Rehabilitation for Madison to Cost $898,370—Twenty-nine Cars to Be Purchased

Representatives of the city of Madison, Wis., the Wisconsin Railway Commission and the Madison Street Railways recently held a joint meeting to consider the tentative program of street paving and street railway improvement which the Madison Railway is to fulfill for the next six years.

The committee which drafted the program consisted of: C. M. Larson, chief engineer; G. C. Matthews, chief statistician of the Railway Commission; Dudley Montgomery, vice-president; Warren Montgomery, treasurer; J. S. Allen, consulting engineer; E. J. Schubring, attorney for the Madison Street Railways Company; J. H. Brown, T. J. Ross and E. E. Parker, city engineer, for the city of Madison.

The total cost of all of these additions and improvements is estimated at $898,370, of which $690,740 is the Madison Street Railways' share and $207,630 is to be borne by the city of Madison. A committee of the Council is now working to embody the plan in an ordinance. It is the intention to complete the above work by 1930.

The features of the plan as agreed upon by the committee, listed in the order of importance, are as follows:

1. Rebuild and pave 300 ft. of single track at Highland and Regent Street.
2. Resurface and pave 600 ft. of single track on West Washington Avenue.
3. Rebuild and double track Atwood Avenue, including 5,600 ft. of single track, two crossings, one turnout.
4. Purchase 17 new cars and scrap 9.
5. Rebuild and pave 2,500 ft. single track and resurface and pave 1,000 ft. of single track on Williamson Street.
6. Resurface and pave 520 ft. of double track on Jenifer Street.
7. Replace track layout at carhouse and add new trackage and construct new storage shed.
8. Resurface and pave 785 ft. of double track on North Hamilton Street.
9. Rebuild and pave 1,950 ft. of double track, resurface and pave 400 ft. of single track and rebuild and pave 4,600 ft. of single track, overhead, crossings, turnouts, curves on Breeze Terrace and Monroe Street.
10. Resurface and pave 700 ft. of double track, resurface and pave 3,000 ft. of single track and pave 700 ft. of double track and build and pave 2,100 ft. of single track on Oregon Road.
11. Rebuild and pave 3,200 ft. single track, eight turnouts, twelve curves on four sides of Capitol Park.
12. Build and pave 4,350 ft. of double track with overhead for same on University Avenue.
13. Purchase 12 new cars and scrap 5.
14. Resurface and pave 3,700 ft. double track, two curves on Jenifer and Baldwin Streets.
15. Resurface and pave 1,500 ft. double track, resurface and pave 3,800 ft. single track, build and pave 3,800 ft. single track, four curves and four crossings on Mills and Emerald Streets.
16. Resurface and pave 2,700 ft. single track, rebuild and pave 2,700 ft. single track, two railroad crossings, one crossover on Winnebago and Atwood Streets.
17. Resurface and pave 2,800 ft. single track, build and pave 2,200 ft. single track on East Johnson Street.
18. Rebuild and pave 1,500 ft. single track, resurface and pave 2,400 ft. single track, build and pave 1,500 ft. single track, build and pave 2,400 ft. single track on Winnebago and West Main Streets.

Big Increase in Use of Wood Preservatives

That the year 1923 was a banner year in the wood preserving industry is shown by figures compiled by the Forest Service, United States Department of Agriculture. More treating plants were in active operation and the quantities of material treated as well as preservatives used were larger than ever before reported for any of the 15 years for which these statistics have been compiled. During the year 135 treating plants, or seven more than reported in 1922, were in active operation. They treated a total of 224,375,468 cu.ft. of wood, representing an increase of 57,755,121 cu.ft., or 34 per cent, over the 166,620,347 cu.ft. reported the year previous.

Increases were registered in 1923 over the quantities reported in 1922 in each of the seven classes of material treated, the largest occurring in cross-ties and poles in the order given. Of the former there were treated a total of 160,830,525 cu.ft., or 36,881,103 cu.ft. more than in 1922. In the case of the latter the total was 26,886,904 cu.ft. and the increase amounted to 9,878,264 cu.ft.

The preservatives used in the treatment of wood in the United States in 1923 consisted of 127,417,305 gal. of creosote, 1,570,932 gal. of paving oil, 28,830,817 lb. of dry zinc chloride and 4,706,968 gal. of miscellaneous preservatives. Zinc chloride was the only one of the four classes of preservatives used that did not show in 1923 an increase in the quantity used over that reported the previous year.

The 127,417,305 gal. of creosote used by the treating plants in 1923 represent an increase of 41,095,916 gal., or 48 per cent, over the quantity consumed in 1922. The consumption of paving oil was greater by 156,250 gal. and the quantity of miscellaneous preservatives used was more than double the amount reported in 1922. As mentioned above, the zinc chloride consumption was less in 1923 than it was in 1922, the decrease in consumption amounting to 1,037,822 lb.

Ever since the compilation of these statistics started in 1909 cross-ties have constituted the bulk of the material treated each year, because the wood preservation industry has been built up largely upon treated wood for railroad use, principally ties.

In 1923 out of a total of over 224,000,000 cu.ft. of wood that were subjected to preservative treatment more than 160,000,000 ft., or 71 per cent, were cross-ties. The actual number of ties was 53,610,175, or 12,293,701 more than in 1922. Although both electric and steam railroads are users of treated cross-ties, the latter employ the bulk of such material. The number of ties for electric railways that were treated during the year was 564,968, and of this number 20,106 were bored, 28,500 were both adzed and bored and 516,362 were neither adzed nor bored. The cross-ties intended for use on steam railroads numbered 53,045,207, consisting of 2,084,841 adzed, 793,776 bored, 3,045,496 that were both adzed and bored and 47,121.094 that were neither adzed nor bored.

The relative quantities of ties treated by different processes since 1909 are shown in an accompanying table.

CROSS-TIES TREATED IN THE UNITED STATES BY YEARS (CUBIC FEET)

	Creosote	Zinc Chloride	Zinc-Creosote	Miscellaneous	All Preservatives
1909	29,830,080	24,153,162	8,095,794	(a)	62,079,036
1910	44,525,229	27,587,583	6,354,219	(a)	78,467,031
1911	49,532,163	28,337,883	7,312,374	(a)	85,182,420
1912	57,461,515	28,532,874	8,214,303	2,974,317	97,183,009
1913	75,998,307	36,051,816	6,938,838	1,792,287	120,781,248
1914	67,774,329	50,020,755	5,868,834	7,877,043	131,540,961
1915	51,231,207	53,457,852	6,548,136	19,560	111,256,755
1916	62,576,403	43,859,028	5,935,242	37,431	112,408,104
1917	48,685,554	44,529,954	6,482,046	680,856	100,378,410
1918	34,638,147	51,166,146	6,023,334	(a)	91,827,627
1919	44,938,215	58,912,323	8,850,222	3,021	112,703,781
1920	40,114,551	87,398,160	7,414,866	35,019	134,962,596
1921	66,139,398	90,797,841	9,183,702	29,604	166,150,545
1922	60,625,086	52,254,303	11,045,913	24,120	123,949,422
1923	104,167,710	46,138,005	10,507,173	17,637	160,830,525

Interborough Orders 150 New Steel Cars

The Interborough Rapid Transit Company, New York, N. Y., notified the Transit Commission on Oct. 22 that it had let a contract for 150 new steel subway cars, the last of the 350 required under the commission's orders, to meet increasing traffic demands. The cars will be made by the American Car & Foundry Company and will cost about $4,000,000.

The additional cars were called for in the commission's orders for May, 1922. The first 100 new cars were put in service a year ago. Seventy-two of the second 100 have been delivered and the remaining 28 will be available in November. Deliveries under the final order, beginning in February, will be completed by next fall.

The company has financed the purchases largely with car trust certificates. The new cars, together with additions to power plants necessitated by the increased car service, involve a total expenditure of about $11,000,000. Completion of the program will give the Interborough 2,277 cars, an increase of 19.2 per cent over the number in operation in 1921. The order for the electrical equipment of the new cars has been awarded to the General Electric Company.

The original order for the 350 additional cars was referred to in the ELECTRIC RAILWAY JOURNAL, issue of May 6, 1922.

Metal, Coal and Material Prices

Metals—New York	Oct. 21, 1924
Copper, electrolytic, cents per lb.	13.25
Copper wire base, cents per lb.	15.125
Lead, cents per lb.	8.40
Zinc, cents per lb.	6.75
Tin, Straits, cents per lb.	51.625
Bituminous Coal f.o.b. Mines	
Smokeless mine run, f.o.b. vessel, Hampton Roads, gross tons	$4.425
Somerset mine run, Boston, net tons	2.05
Pittsburgh mine run, Pittsburgh, net tons	1.875
Franklin, Ill., screenings, Chicago, net tons	1.375
Central, Ill., screenings, Chicago, net tons	1.175
Kansas screenings, Kansas City, net tons	2.00
Materials	
Rubber-covered wire, N. Y., No. 14, per 1,000 ft.	$6.25
Weatherproof wire base, N. Y., cents per lb.	17.75
Cement, Chicago net prices, without bags	2.20
Linseed oil (5-lb. lots), N. Y., per gal.	$1.08
White lead, in oil (100-lb. keg), N. Y., cents per lb., carload lots	0.12
Turpentine (bbl. lots), N. Y., per gal.	0.85

Rolling Stock

South Carolina Gas & Electric Company, Spartanburg, S. C., has ordered nine new buses from the White Company.

Brooklyn City Railroad, Brooklyn, N. Y., is sending out specifications for cars similar to the lot ordered last year, namely, four-motor, double-end cars with center exit. The number of cars to be purchased has not yet been determined.

Track and Line

Grand Rapids Railway, Grand Rapids, Mich., is making preparations with the city of Grand Rapids for the laying of new track on at least a half mile of Division Avenue and the paving between the tracks. The work would be begun next summer. Division Avenue, now a main artery, the city hopes soon to make a 100-ft. street. To facilitate operating conditions in the downtown section the company this fall will construct a new wye at Michigan Street and Monroe Avenue, the cost to be about $15,000 and the work to be completed in three weeks after starting.

St. Joseph Railway, Light, Heat & Power Company, St. Joseph, Mo., started work on the relaying of tracks on South Eleventh Street from Mitchell Avenue to Garfield Avenue on Oct. 1. This is an important reconstruction job with practically a mile of double track to relay. In this work 672,000 lb. of steel rails will be used. The cost of the rails alone will be nearly $20,000. For this work approximately 1,500 steel ties will be used. They will cost $10,650. Altogether about $50,000 will be spent in St. Joseph for material and supplies.

Washington Railway & Electric Company, Washington, D. C., has agreed to spend $105,000 in laying a new set of tracks for the Georgetown and Tennallytown line, in the center of Wisconsin Avenue. The District has agreed to allot, out of the $350,000 appropriated by Congress for the paving, the sum of $64,000 toward the trackwork.

Grays Harbor Railway & Light Company, Aberdeen, Wash., has announced the resumption of through service to Cosmopolis. The company has expended $14,500 laying new tracks and is contemplating considerable work on the Aberdeen-Cosmopolis line. The company has applied to the City Council for permission to place a single track across the new Wishkah River bridge.

Pacific Electric Railway, Los Angeles, Cal., has completed the extension of its line from the foot of East Second Street, Long Beach, to Naples Junction. The extension is more than 1½ miles in length. The Belmont Shore Company donated the right-of-way through its tracts and contributed $63,000 toward the cost of the line's construction.

Boston, Mass. — Construction work will begin soon on the new rapid transit line in Boston, from Andrew Square to Mattapan. The Boston Elevated Railway has signed an agreement with the city of Boston Transit Department for the lease and operation of this new line when it is completed. Bids were asked Oct. 20 by the Transit Department for the construction of the first section, out of Andrew Square. This is a tunnel section, and the excavated material will be used for fills at other points along the route. A part of the route will be the Shawmut branch of the New York, New Haven & Hartford Railroad, which was bought for $950,000. The railroad stations that will be discontinued are Field's Corner, Shawmut, Ashmont, Cedar Grove, Milton, Central Avenue and Mattapan.

Third Avenue Railway, New York, N. Y., is reconstructing 1½ miles of double track on Broadway from 242d Street to the Yonkers city line. The new construction is with 7-in., 122-lb. standard A.E.R.E.A. grooved girder rail on new creosoted ties with welded joints. The old construction consisted of 9-in. grooved girder rail on untreated wood ties spaced at 2-ft. centers with bolted joints. It is estimated that this improvement will cost approximately $180,000.

Trade Notes

Winona Service Equipment Company, Indianapolis, Ind., has been incorporated to deal in rolling stock and equipment for street or interurban railroads. The directors are Harry Reid, J. F. Wild and Ira E. Guthrie. It has a capital of $30,000 common and $60,000 preferred stock.

Hynes & Cox Electric Corporation, Albany, N. Y., has been formed to enlarge and carry on the electrical heating business established by Lee P. Hynes. Mr. Hynes has not severed his connection with the Consolidated Car Heating Company and the new firm, although handling industrial work, will not deal in any materials which conflict with the work of the Consolidated Car Heating Company.

H. T. Heath has been appointed western department manager of the Hegeman-Castle Corporation of Chicago, owned and controlled by the National Railway Appliance Company of New York. Mr. Heath was at one time connected with the Westinghouse Electric & Manufacturing Company and later with the Economy Electric Devices Company.

Eisemann Magneto Corporation, New York, N. Y., announces that O. S. Stanley has been placed in charge of the middle Western territory, with headquarters at 2005 South Michigan Avenue, Chicago, vice P. G. Sedley, resigned. Irving W. Edwards has assumed the duties of district manager, with headquarters at 85 Second Street, San Francisco.

John F. Folkers Engineering Corporation, Mobile, Ala., has been appointed agent to handle sales and service for the Triumph Electric Company in the Mobile territory.

New Advertising Literature

Atlas Valve Company, Newark, N. J., has issued edition No. 1 of Bulletin 5-A, which is devoted entirely to its line of Victor damper regulators. The functions of damper regulators are listed under nine separate headings. Hydraulic operation as compared with other methods of operation is discussed. Diagrams show how to apply the regulators to boilers. A technical description is given with illustrations explaining in detail the method of operation of the high-pressure damper regulator.

Engineering Products Company, Chicago, Ill., has issued a new price list and descriptive circular covering its line of rail benders, track drills, gages and levels. Copies of this new list will be furnished on request.

General Electric Company, Schenectady, N. Y., has issued Bulletin No. 48,941A, entitled "CR-9006 Enameled Resistor Units." It is an 18-page illustrated booklet describing the uses and advantages of these units and giving standard ratings and dimensions.

Scovill Manufacturing Company, Waterbury, Conn., has issued "Brass Facts," a 28-page booklet dealing with the characteristics of copper alloys, especially brass. The book classifies and gives the chemical composition of the most popular brass mill alloys such as brass, bronze, nickel silver and cupro nickel. It tells in detail how brass and nickel silver are made free cutting. Annealing for degrees of softness of brass is gone into, with numerous illustrations, showing the microstructure of annealed as well as rolled brass. This booklet also contains a detailed description of the method of manufacture of cup drawn Admiralty and special Muntz Condenser tubing and seamless tubing.

The Universal Coal Spreader Company, Chicago, Ill., has issued a seven-page pamphlet entitled "The Universal Coal Spreader." The pamphlet describes, with illustrations, operation with and without the Universal coal spreader.

Are We Determining Street Railway Wages in the Right Way?

TWO serious questions are raised by the increases in wages since the first of the year on a number of electric railways as the result of wage arbitrations. First, what is the industry going to do if wages continue to go up, or even if they remain at their present level? Second, is the right method being used generally now to determine the rate of wages to be paid?

As to the fact that wages on electric railways are very high at present, there can be no question. Albert S. Richey's index figure for October, 1924, published in this paper last week, was 221.9. This is larger than at any time during the war, and in the history of the industry it has been exceeded only for thirteen months in 1920 and 1921, at a time beginning at the peak of all the other common index figures.

Another disquieting fact about the present wage index figure is that during the last year and a half it has constantly been going up. Thus in April, 1923, it was 207.3. During the next six months it gradually went to 217.5. In January of this year it was 218.9 and in February it was 219. By June it had reached 220.4. In July, August and September it was 221.4 and October showed the figure of 221.9, already mentioned. The figures quoted are weighted, according to the method Mr. Richey has been following, on the basis of passenger cars operated by the different companies.

Obviously, if railway companies could increase their receipts in the same proportion as wages go up, their balance would still be on the right side of the ledger, but it is not always easy legally to raise fares nor always advisable economically to do so. Boston, it is true, has raised its local suburban fare from 5 cents to 6 cents due to its recent wage increase, but the effect on traffic is yet to be determined.

The second question likely to be raised in connection with recent wage increases—and closely connected with it—is whether the right method is being used generally by arbitration boards to determine the rate of wages. As a rule, in such proceedings held recently, the decision on whether wages will go up or down involves the question of whether there has been an increase or decrease in living costs, as shown by the various index figures and testimony on local conditions.

There are three manifest objections to the use of changes in the cost of living as the basis for a change in wages. The first of these is that the fairness of a wage schedule so determined must depend entirely upon the fairness of the one previously used. The second is the difficulty of determining the exact percentage of change in cost of living from the testimony usually presented. The third objection is that the extent to which it is used requires a corresponding disregard of the old measure of "supply and demand."

One advantage of the "supply and demand" method of determining wages is that generally it is capable of only one interpretation. Where the turnover is large, the wages are probably too low. If the turnover is very low, the wages may be unnecessarily high. Many electric railways have recently enjoyed a very low labor turnover. By itself this is a very desirable condition, but it is also evidence that employment conditions must be very satisfactory as compared with those, including wages, existing in other industries. In such circumstances, the question naturally arises: Is an increase in wages economically justified if those paid at present are enough to attract and retain competent employees?

Twenty Years of Transit Development

THE dinner given this week celebrating the twentieth anniversary of the opening of the first of New York City's subway lines, at which Frank Hedley, president and general manager of the company, was guest of honor, marked in a fitting way this milestone in the progress of metropolitan transit. The need for better facilities had been felt for a long time. The original elevated railways had been built some 30 years earlier, and operated first with steam and much later with electricity. Surface cars were installed on all the principal streets of the city, and were working to the limit of their capacity. Even subways had been projected years before, the first one having been proposed as early as 1868 and others following from time to time. Subway building, however, costs more money than the early planners could command. It took the courage and tenacity of August Belmont and his associates to finance the project, which in those days was an enormous undertaking for private capital.

At the time the subway was begun it was difficult to see the profound effect that event would have on the future development of the city, for the new line was looked on only as a supplement to the existing system of elevated lines which had been developed for many years. It was built in preference to an elevated largely on account of a civic pride that barred all overhead obstructions from the better streets of Manhattan, and incidentally to save damage claims from property owners. But on account of removing these objections it was possible for the new line, unlike the elevated roads that had been built earlier, to make its path through the heart of Manhattan, and as an extension on an elevated structure, well out into the Bronx. Soon it was extended to the center of Brooklyn through tunnels under the East River, doing away with the ferries and the transfer at the Park Row terminus of Brooklyn Bridge. Then, too, it gave a type of high-speed express service never thought possible on a purely urban railroad.

This original subway was but the beginning of a network that has been made to cover four of the five boroughs of the greater city and weld them into a homogeneous city, far greater than that dreamed of before rapid transit was a reality. While before the transportation systems were the child of the city, the city became the child of the transportation system. The entire face of the metropolis was transformed. Manhattan, once complete in itself, became the workshop of the greater city, and the farms and pastures of the old days became the residence districts. Instead of the promoters having to beg the city for permission to build, the city is now in the position of being the subway promoter, as it has been realized that only by rapid transit can the city prosper.

But a subway once built must be operated, and to be successful financially it must carry more people and at less cost than any other form of transportation. As one of the speakers at the dinner humorously remarked, it took a genius to pack 'em in for twenty years in the rush hours in such a way that the people still demanded more subways. That is the accomplishment of Mr. Hedley, who has managed the property during the entire 20 years of its existence, as well as the network of elevated lines of the Interborough system. One of the speakers remarked that his job is the hardest railroad job in the world. Under his direction the road has not only been operated as planned, but stations have been enlarged, trains have been lengthened, signals have permitted much closer headways, and automatic devices on the cars have permitted higher train speeds with a material reduction in the platform labor needed, so that the original subway is now carrying about four times as many passengers as it was designed for. With all this rush and bustle, the service continues day after day with scarcely an interruption. And "The New York subways always have returned to every customer more than full value for every nickel received." Surely this is an accomplishment of which any man can be proud, as the speakers at the dinner pointed out in paying tribute to the leadership of Mr. Hedley.

Making Anti-Friction Bearings Win

IT IS to be hoped that something more than a quizzical raising of the eyebrows will greet the account of progress with anti-friction bearings on some thirty-seven continental properties, as presented to the Internationaler Strassenbahn und Kleinbahn Verein in a paper by Karl Pforte, manager of the Hagen Street Railways. This report, abstracted elsewhere in this issue, is a strong reinforcement of a like statement on Franco-Belgian street railways by Ch. Harmel, manager of the East-West Tramways of Liége, which was abstracted in the issue of Aug. 30, 1924.

On the mere face of American experiences with anti-friction bearings, a certain degree of doubt as to their value would be justified. Operators in this country have tried, discarded and tried again both the ball and roller bearing in motors and for car journals. Most of the unfortunate experiences, also, have been with the journal bearings rather than those in the motors.

Manufacturers of anti-friction bearings no doubt began to use them on electric car equipments without a full realization of the hard service to which they would be subjected. But going deeper than a superficial summary it will be found that the manufacturers have been far less at fault than the assemblers and maintainers of car equipment, as well as those responsible for standards of track upkeep. One case comes to mind where it was absolutely impossible to run a batch of cars fresh from the builder because the ball-bearing journal boxes had been wrongly installed. Again, more than one failure of anti-friction bearings has been traced back to the shops where a graduate of the village smithy rather than a precision mechanic had the responsibility for results. In many cases, also, it was forgotten that a street car bearing has no rubber tires to absorb shocks that are ruinous to the anti-friction types.

If so many European properties can show good results from the use of anti-friction bearings, there must be several good reasons aside from matters of design and quality of material. Two reasons, undoubtedly, are the employment of better-skilled labor and the insistence upon smoother track. Certainly there is no reason why Americans cannot obtain results as good as those across the Atlantic.

Tell the Men the Real Meaning of Transportation

IN THE broiling heat of a summer afternoon, a railway shopman is engaged in the tiresome job of cleaning and inspecting the equipment of a snow sweeper. Such a task on such a day seems a cruel mockery. Who can blame the man for performing his work half-heartedly? Yet, because he is a real railway man, he does it with the same care and attention that the painter uses when decorating the exterior of a car.

Railway operation at times is full of interest, excitement—and sometimes of danger. The work of the moment may be to clear a blockade quickly, or to reroute cars in case of a fire so that passengers will not be delayed. It may be to pick up a fallen live wire or to keep the lines open during a terrific storm. Transportation means providing service as safe, as speedy, and as comfortable as may be possible—in the face of whatever obstacles nature or man may place in the way.

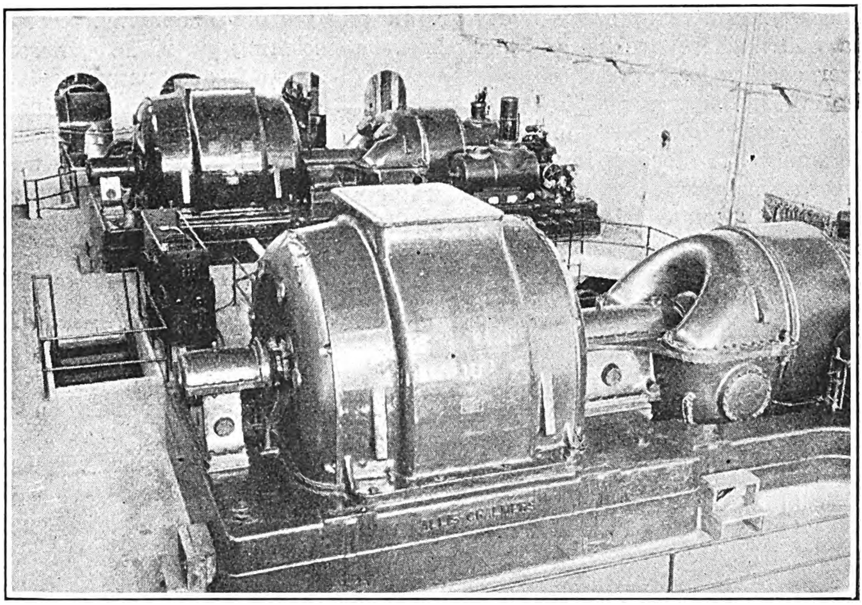
But transportation has another and less romantic side. It means keeping everlastingly after small details. It means inspecting brakes, tightening nuts, testing signals or walking the track in a dark subway. The excitement that sustains the men engaged in the actual operation of cars is lacking to those in the mechanical, electrical, or track departments.

There is nevertheless a certain satisfaction in knowing that the lives of the passengers may depend quite as much on the thoroughness of the man working unseen in the pits as on the care exercised by the man at the controller. Old railway men realize this. They know that responsibility for carrying the public safety rests equally on the men in every department and that the real reward in the transportation industry is not the wage paid but the consciousness of service rendered. Money alone would hardly induce a mechanic to work for hours in the heat of summer to put equipment in shape for the winter. Only the knowledge that it was part of the game would make him do a good job.

But new blood must be brought into the industry if it is to survive and progress. The new men taken into railway organizations every year do not always understand and share the point of view of the experienced transportation man. Yet nothing is more important than that every workman should be an enthusiast about his own business. No pains should be spared, therefore, in imbuing the new men with the spirit of transportation that has always made it one of the favored vocations of men with ability and vision.

Denver Tramway Modernizing the Power Plant

Faced with an Urgent Need for Increased Power Supply, and Unable to Buy Additional Power Advantageously, the Denver Tramway Has Increased the Capacity of Its Platte Street Plant So as to Meet All of Its Needs for a Number of Years



Interior View of New Section of the Turbine Room Shows the Two Units Recently Installed. The Entire Cost of the Plant and Buildings Is Now Less than $63 per Kilowatt of Capacity

RECENTLY completed changes and additions to the Platte Street power plant of the Denver Tramway represent the final solution of a serious and perplexing power supply problem that faced this company in 1922. At that time the economical generating capacity of the railway plant, together with approximately 15 per cent of purchased power, was insufficient for its needs. In addition, there was no reserve capacity to take care of the existing demand in the event of a shutdown of the principal turbine unit, and available facilities of power companies in the district offered no advantageous relief.

With this situation confronting it, the management made a careful analysis of the existing conditions and also of the probable future requirements for power. Finally, through a fortunate purchase of surplus generating equipment from the government, the railway company has been able to modernize its plant thoroughly and also to provide on an economical basis reserve capacity for the future.

LOW INVESTMENT AND OPERATING COST

The cost of the completed plant as now operated is less than $63 per kilowatt of capacity. This includes not only the cost of new equipment and installation labor in that part of the plant which is now operated, but also includes all real estate and buildings (a good portion of which is taken up by a building that houses old reciprocating equipment which will ultimately be disposed of). It also includes the total cost of six 750-hp. capacity Stirling boilers and the cost of a considerably larger boiler room than is actually required for the equipment which is now being used. This boiler room gives available space for future expansion of boiler capacity.

For a comparatively small station, the total costs of generated power are also maintained at a low figure. On page 760 a table gives a consecutive record of the cost of power to this company for a period extending back to 1910. In analyzing these figures it must be borne in mind that this is practically all railway load, which has an inherently poor load factor, and that the increased use of private automobiles has resulted in making this condition worse than was formerly the case.

OLD PLANT LACKED CAPACITY

An approximate idea of the situation confronting the company in 1922 may be obtained from an examination of the conditions existing before the plant was reconstructed. At that time the power was supplied by the equipment listed below.

In addition to the generated energy, the tramway company purchased approximately 15 per cent of its requirements in the form of hydro-electric power from the Colorado Power Company.

Combining the capacity of the plant and the purchased power gave a total of 19,575 kw. available. With No. 8 turbine shut down this capacity was reduced to

Platte Street Power Station		
Nos. 1 and 2	Two 800-kw. d.c. generators, engine driven	1,600 kw.
No. 4	One 1,600-kw. d.c. generator, engine driven	1,600 kw.
No. 5	One 1,500-kw. a.c. generator, engine driven	1,500 kw. at unity p.f.
Nos. 6 and 7	Two 2,000-kva. a.c. generators, turbo driven	4,000 kw. at unity p.f.
No. 8	One 7,500-kw. a.c. generator, turbo driven	9,375 kw. at unity p.f.
Total generating capacity		18,075 kw. at unity p.f.
Delaware Substation 60-cycle purchased power		
Rotary	One 1,500-kw. rotary converter	1,500 kw.
Total capacity of all sources of power		19,575 kw.

10,200 kw. The hourly peak load averaged 11,500 kw., so that with the No. 8 turbine out of commission, the maximum hourly peaks of 13,500 kw. could not be taken care of. Swing peaks were running up to approximately 16,000 kw. Because of the high water rates of the two small turbines and the reciprocating units the boiler capacity was only sufficient for about 10,125 kw. with No. 8 turbine shut down.

From the foregoing, it is apparent that if No. 8 turbine was shut down the old generating equipment would not be able to take care of the demand except under excessive overloadings. Its age and physical condition was such that this was taking unwarranted chances. No. 8 turbine was five years old and getting to a point where overhauling periods were becoming longer each year.

For years the average kilowatt demand of the system changed very little, but the maximum demand during rush hours has steadily increased. This is due to the increased rush-hour business of the company and the effect the automobile has had in holding down the off-peak load.

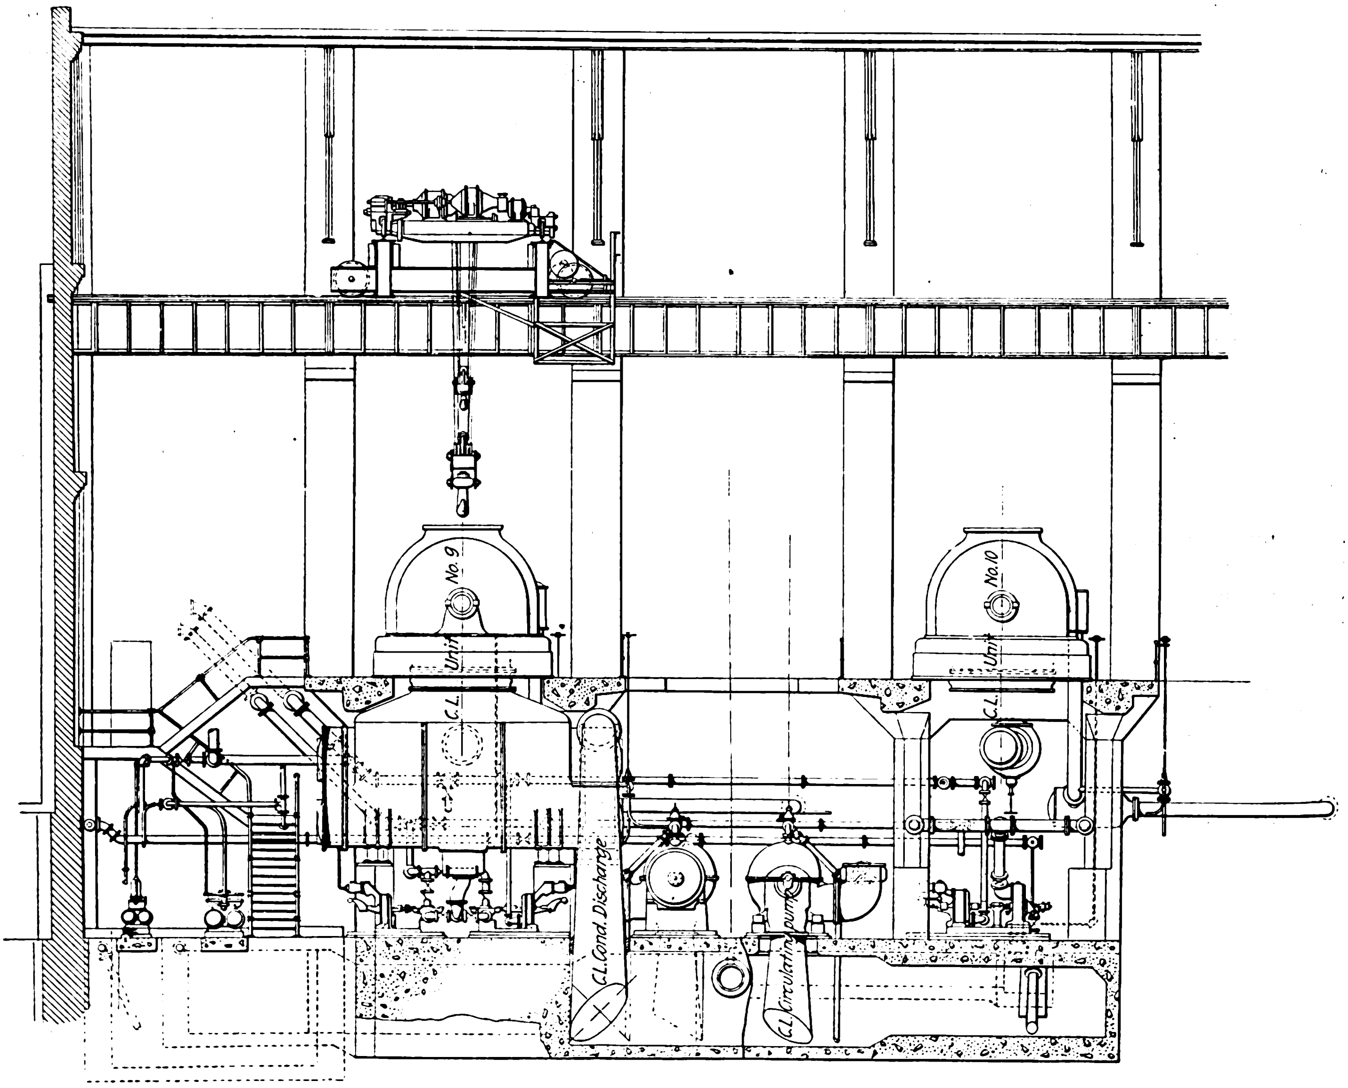
The capacity of generating equipment is determined by the maximum demand and the economy of the plant, and the proper size of generating units is fixed by the load factor. To determine just what was needed in the way of additional capacity, load factor curves were prepared, which took into consideration past loads, rate of increase in population, increased use of passenger automobiles, capacity of business district to accommodate parked automobiles, size of motors necessary under rolling stock, car speeds, number of cars required, etc. A period of 15 years was covered.

THREE PLANS OF PROCEDURE CONSIDERED

In view of the above situation it was necessary either to install more generating equipment or enter into contract for additional purchased energy. Three possible plans of procedure were considered.

1. To purchase all of the energy required by the company.
2. To generate all of the energy required by the company.
3. A combination of generation and purchase.

These plans were studied carefully. The "all purchase" plan was found impossible. There were two power companies in the field. The first did not have sufficient capacity to take care of the entire railway requirements, and even with sufficient capacity available, the rate was not attractive to the company. This situation was further complicated by the fact that the power would be delivered over long-distance transmission lines, making it necessary to have sufficient steam standby available to take care of interruptions. Steam



Cross-Section Through the Remodeled and Enlarged Platte Street Plant Shows the Arrangement of Turbines, Foundations and Auxiliaries standby in sufficient amount to guarantee continuity of service meant fixed charges to be added to the power company's charges.

A second power company in the field was not in a position to furnish the railway with power and suggested that it wait until a project the power company was working on had been completed. However, the time was too far in the future and the company was faced with the danger of a breakdown at any time. The rate offered, compared with the railway's own generating costs, also put this plan out of the question.

Another important reason why the company could not consider the purchase of all of the energy required by it was that its substations were all 25-cycle and the power companies were proposing to furnish 60-cycle energy. The conversion losses would be high, or if the company was required to sell the 25-cycle equipment and install 60-cycle apparatus, an expense of $600,000 would have been incurred with very little opportunity for recovering any part of this expense through the sale of the 25-cycle equipment.

The third proposition was a combination of purchase and generation, and this was rejected for some of the reasons outlined in the preceding paragraph, and also because the power company could not supply energy at a cost low enough to be attractive.

All Generation Plan Adopted

The second proposition of "all generation" was finally adopted. With the fact established that it was impossible to work out a satisfactory purchase scheme, either for all or part of its power, there was only one proposition left for the tramway company and that was to increase the generating capacity. The contract with the hydro-electric plant was expiring and could not be renewed on the old basis, so inquiries were made for one additional turbine unit of 10,000 kw. or larger capacity, which with No. 8 would have given approximately 20,000 kw. modern generating capacity. Proposals were solicited from the various manufacturers, estimates prepared and plans started for the addition of one new unit. There was sufficient building capacity to house this unit and sufficient boiler capacity available to supply the necessary steam requirements.

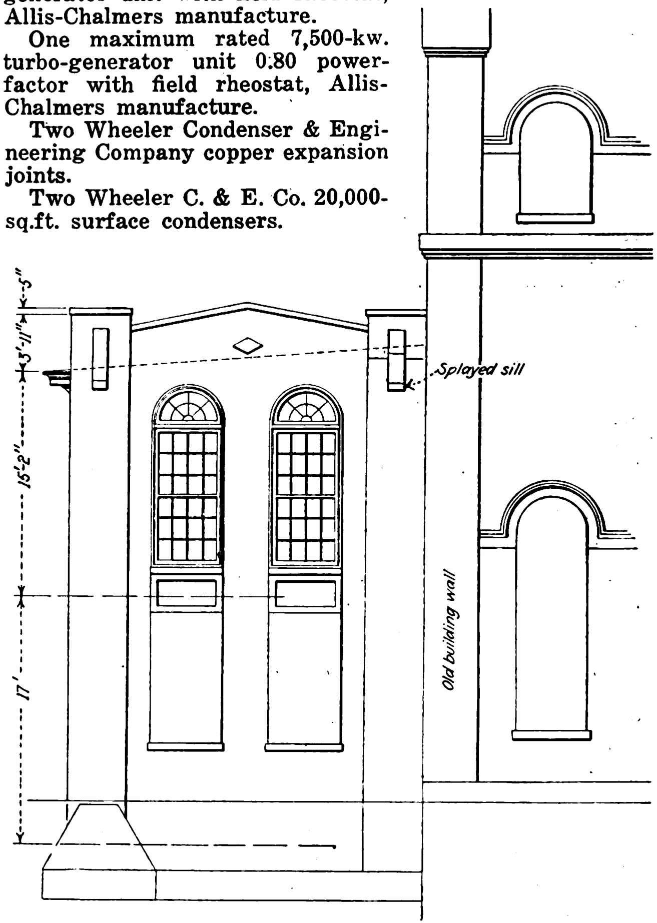
While securing bids the company's attention was directed to an advertisement by the government offering for sale generating equipment at one of the arsenals. The specifications of this equipment were identical with those covered in the specifications for the proposed additional capacity. Negotiations were started and resulted in the purchase of this equipment, which included the following:

One 10,000-kva., 8,000-kw., 0.80 power-factor turbo-generator unit with field rheostat, Allis-Chalmers manufacture.

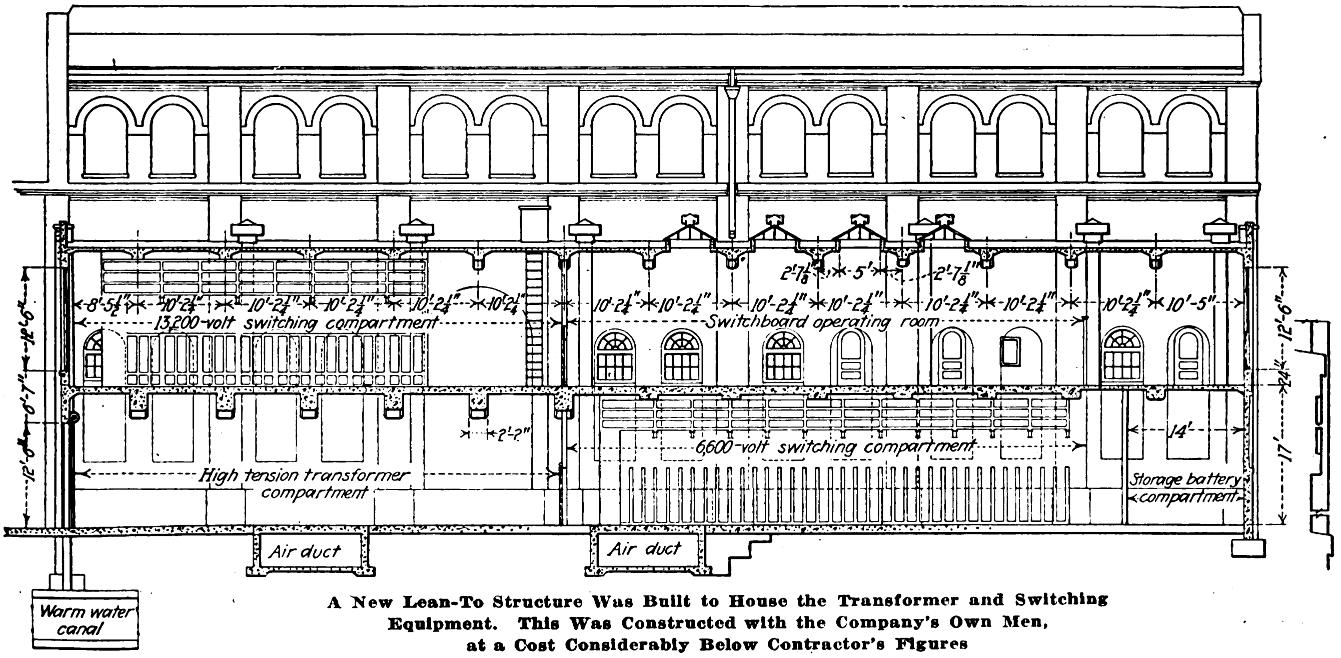
One maximum rated 7,500-kw. turbo-generator unit 0.80 power-factor with field rheostat, Allis-Chalmers manufacture.

Two Wheeler Condenser & Engineering Company copper expansion joints.

Two Wheeler C. & E. Co. 20,000-sq.ft. surface condensers.



End View of Addition Housing the Transformer and Switching Equipment



A New Lean-To Structure Was Built to House the Transformer and Switching Equipment. This Was Constructed with the Company's Own Men, at a Cost Considerably Below Contractor's Figures

ENERGY COST ON DENVER TRAMWAY, 1910-1924

Year	1910	1911	1912	1913	1914	1915	1916	1917	1918	1919	1920	1921	1922	1923*	1924†
Energy generated and purchased, cost per kilowatt-hours (cents)	0.81	0.89	0.82	0.88	0.92	0.87	0.77	0.70	0.72	0.80	0.84	0.88	0.79	0.74	0.68
Pounds of coal per kilowatt-hour	4.97	5.03	4.91	4.89	4.90	4.48	4.19	3.94	2.51	2.46	2.57	2.55	2.55	2.47	2.53‡

*First new unit tried out November, 1923.
Both new units in service and old machines shut down—Nos. 8, 9, 10 in regular service and No. 4 as standby.
†Colorado lignite slack, average about 9,000 B.t.u.
‡Four months.

Four Wheeler C. & E. Co. hot well pumps direct connected to G.E. turbines.

Two Wheeler C. & E. Co. centrifugal air pumps direct connected to G.E. turbine.

Two Wheeler C. & E. Co. 24,000-gal. per minute circulating pumps direct connected to Allis-Chalmers motor with compensator.

Three "Rex" revolving intake screens, with motor drives.

Two Crane Company steam separators.

One General Electric Company 100-kw. exciter with field rheostat direct connected to G.E. turbine.

One G.E. 120-kw. exciter with field rheostat, direct connected to G.E. motor with compensator.

One "Northern" 50-ton electric traveling crane with 10-ton auxiliary hoist.

Three 750-kva., three-phase, 25-cycle, 6930/13860Y/480Y, G.E. transformers.

One Laidlaw-Dunn-Gordon 600-cu.ft. air compressor belt driven by G.E. motor with compensator.

One Allis-Chalmers 400-gal. per minute centrifugal boiler feed pump direct connected to Allis-Chalmers turbine.

One Allis-Chalmers 300-gal. per minute centrifugal service pump, direct connected to Allis-Chalmers turbine.

Two American Spray Company 25,000-cu.ft. per minute air washers with motors.

This equipment was new; some of it had never been uncrated; one of the units had been partially set up and the other was on the floor just as taken off the cars. It developed that these two units, having a total capacity under the conditions obtaining in railway operation of nearly 20,000 kw., which had never been used, could be purchased at a reasonable price. It was impossible to negotiate with the government for the purchase of one machine, so therefore, inasmuch as they and their auxiliaries were so well suited to the needs of the Denver Tramway, both units were purchased and installed. The net result is that this power plant is thoroughly modernized and has sufficient capacity to produce power economically for years to come. From a study of the load forecast it was apparent that a single 10,000-kw. machine would have given sufficient capacity only until 1926.

INSTALLATION OF NEW EQUIPMENT HAS GIVEN RAILWAY ADEQUATE CAPACITY

The two units purchased from the government are known as Nos. 9 and 10. They are located in the power house in the same position as No. 8, set on reinforced concrete foundations, column design. The condensers are at right angles but directly underneath the discharge end of the turbine, close connected. These condensers are Wheeler C. & E. Co. 20,000 sq.ft. capacity ultimate, now equipped with 12,500 sq.ft. of tubes. They are served with Wheeler C. & E. Co. hot water pumps connected to G.E. turbines and Wheeler C. & E. Co. centrifugal air pumps connected to G.E. turbines. There are two hot well pumps for each condenser. Each condenser also has a Wheeler C. & E. Co. circulating pump direct connected to an Allis-Chalmers motor. Allis-Chalmers service pumps of 300 and 400 gal. per minute are installed. The air intakes to the generator are protected with an American Spray Company 25,000-cu.ft. per minute air washer, motor operated.

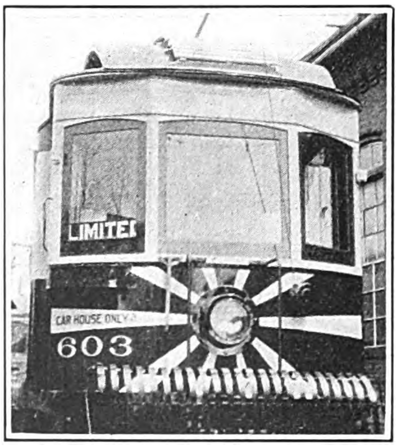
The high-tension switches for this station had been located in a building that had long since become overcrowded, and it was necessary to build a new structure to house this equipment. This new switch house is of concrete lean-to construction, two floors, housing the high-tension transformers, 13,000-volt concrete bus-cell structure and the 6,600-volt concrete bus-cell compartments; also the generator feeders and the auxiliary switchboards, which in the old arrangement were located in the lower part of the old engine room. The transformers, oil switches and bus construction are of modern design.

All of the foregoing work was undertaken and consummated by operating forces of the tramway company with the exception of one Allis-Chalmers superintendent of erection and the construction costs were appreciably lower than those estimated in the bids which were submitted by contractors.

The new equipment was installed with no interruption of service. The turbines were erected, tested out and placed in operation in conjunction with the old equipment. At no time was it necessary to shut down the plant on account of this construction work. The changeover from the old switch house to the new was carried on under operation.

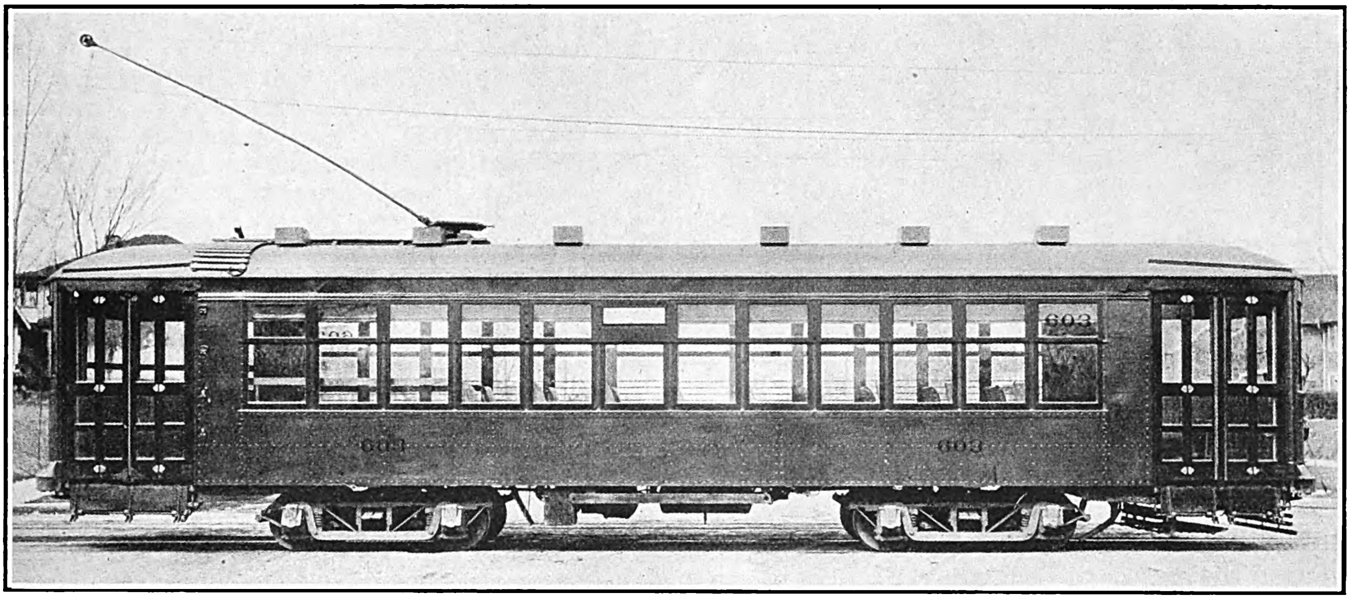
Painting to Widen the Car

AN UNUSUAL camouflage scheme is being tried on the dash painting of a number of the cars of the Schenectady Railway. The design shown in the accompanying illustration is worked out to give the appearance of greater width than actually exists. By an optical illusion the car at a casual glance appears to be several inches wider than it actually is and the object of this is to deceive automobilists and truck drivers into giving the car a little more room than they ordinarily would. It is being tried out by Niles Persons, master mechanic of the railway. It is believed that it will reduce accidents of the side-wiping type between street cars and other vehicles on the street.



How Schenectady Cars Are Camouflaged to Give Appearance of Greater Width

Another peculiar painting design was tried on the new cars of the Brooklyn City Railroad, but in this case it was for the purpose of attracting attention to the new cars as a means of inviting traffic and informing passengers that it was one of the new front-entrance, center-exit type cars.



These Low-Floor Cars Have Proved Popular with the Riding Public in Des Moines

Medium-Weight Low-Floor Cars in Des Moines

New Cars Have Proved Popular with Passengers—Single-End Construction Gives Seating Capacity of 48 and Total Weight of 38,000 Lb.

TEN new cars of moderate weight and pleasing appearance, which were put in service in Des Moines early in the summer, have proved very popular with the riding public. These cars are arranged for single-end operation and are equipped with four G.E. No. 247 motors and K-35 control. They are of the straight side girder type of construction with arch roof and folding doors and steps at front and rear. The platform floors are carried flush with the car body floor, and a 3½-in. ramp from the bolsters to the end sills serves to reduce the height of steps.

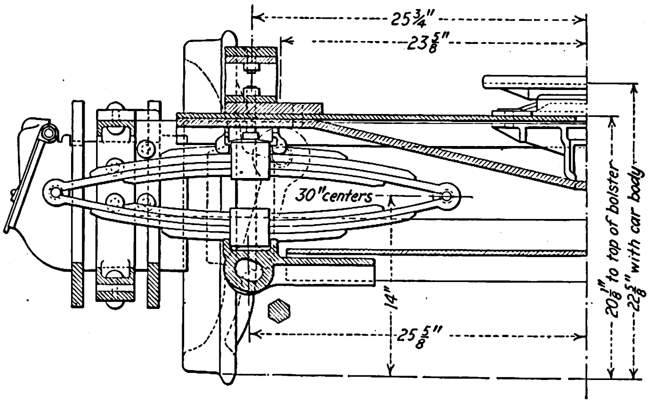
Side posts are spaced on 2-ft. 5¼-in. centers; and with an over-all length of 46 ft. a seating capacity for 48 passengers is obtained. By carrying the inside lining close to the girder plate the cross-seat width is made 35 in. and the aisle is 25⅜ in. between the seat aisle plates. The seat backs are offset at the aisle end so that the distance between the edges of the backs across the aisle is 29⅜ in.

Cherry is used for the interior trim. The headlinings are painted cream color and all interior rails and stanchions are of aluminum.

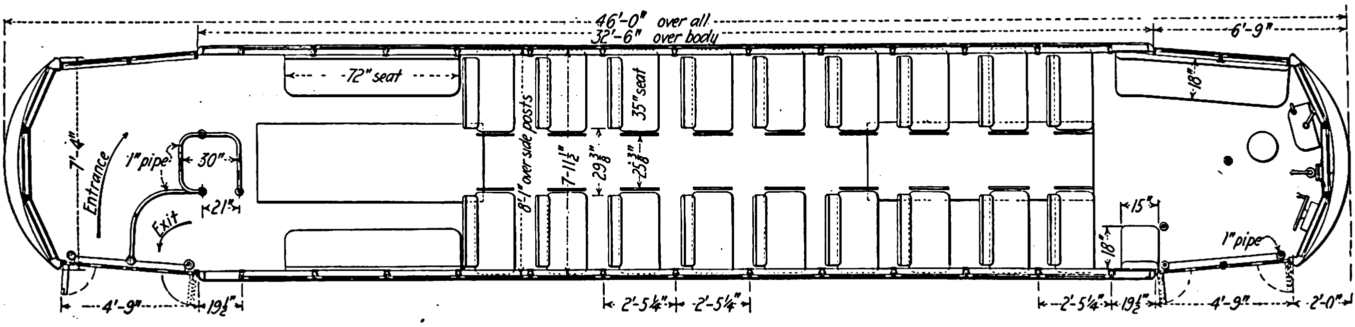
The principal dimensions and distribution of weight are as follows:

Length over all	46 ft.
Width over all	8 ft. 2 in.
Bolster centers	20 ft. 6 in.
Side post centers	2 ft. 5¼ in.
Width over side posts	8 ft. 1 in.
Height over trolley board	10 ft. 11 9/16 in.
Height from rail over car floor	33½ in.
Height from rail to bottom of side girder	26 13/16 in.
Height from rail to platform floor	30 in.
Height from rail to step	15⅝ in.
Height from step to platform floor	14⅜ in.
Wheel diameter	26 in.
Wheelbase of truck	5 ft. 6 in.
Weight of car body complete	20,000 lb.
Weight of truck with four GE-247 40-hp. motors	10,000 lb.
Weight of equipment	8,000 lb.
Total weight completely equipped	38,000 lb.

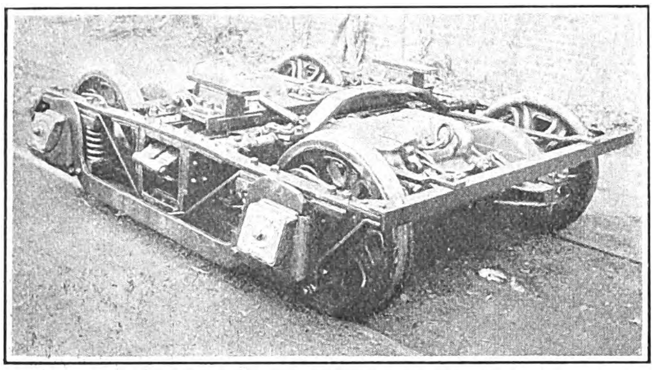
The cars were built by the McGuire-Cummings Manufacturing Company, and are mounted on McGuire-Cummings type MC-62 low-level trucks. These trucks are



The Arched Brake Beam on the Special Type of Low-Level McGuire-Cummings Truck Has Two Long Shoes that Ride on Longitudinal Straps and Keep the Beam from Tilting



Single-End Construction Gives a Seating Capacity of 48—Folding Doors Are Pneumatically Operated



Low Car Level and Ample Road Clearance Are the Objectives in the Truck Design

of the equalizer type and are specially designed to give the low level and at the same time maintain a minimum clearance of 4 in. above the rail. The brake rigging is arranged with an arch brake beam having a long forged sliding shoe at each end which rides on top of longitudinal members extending from the transom to the end frame, and which are designed to keep the brake beam from tilting. The double-length brake hangers are provided with a spring on the top to prevent chattering. Compensating-type full elliptic bolster springs are arranged to provide for variation in the live load.

All wearing parts of the trucks are case hardened, including pins and bushings. Pedestals are made of forged steel, machine finished. A cast-steel yoke connects the 2½-in. x 7-in. flat-bar transom to the side frame, and heavy gussets are provided to reinforce the corners and support the brake rigging. The bolster is of built-up construction, composed of channels and plates. Journals are 3¾ in. x 7 in.

Four GE-247 40-hp. motors provide the motive power for these cars and the control is type K-35-JJ. The detailed specifications and list of equipment are as follows:

Compressor	GE CP-27
Seats	Heywood-Wakefield upholstered rattan
Heaters,	Consolidated Car Heating Co.
Thermostats,	Railway Utility Co.
Ventilators,	Railway Utility Co.
Curtain fixtures	Ring No. 88
Curtains,	Double-face pantasote
Hand brake	Peacock
Headlining	Agasote
Control	GE K-35-JJ
Trolley base	US-13E
Door equipment,	National Pneumatic Co
Headlight	Golden Glow
Sand trap,	Des Moines standard
Outside paint,	Pratt & Lambert Vitrolite
Axle	Standard Steel Works
Wheels	Illinois Steel 26-in. rolled steel
Lifeguards	H-B
Register	International R-5

Saving by Radio Announcing

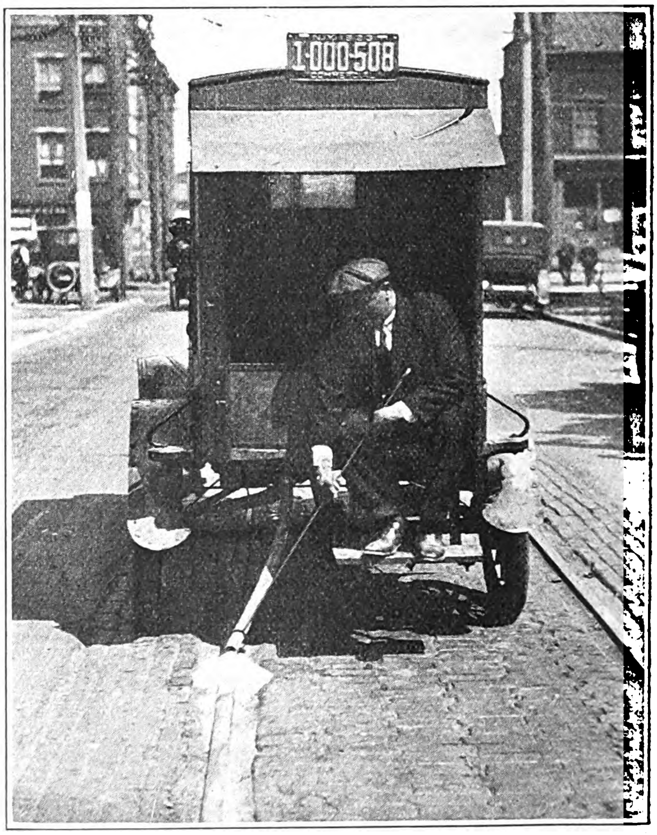
AN INTERVIEW in the Detroit *News* with H. M. Gould, assistant general manager of the Department of Street Railways, Detroit, gives the savings up to date from the use of radio for summoning repair crews. An account of the method followed in this matter was published in the ELECTRIC RAILWAY JOURNAL for July 12.

During May, June, July and August of this year, 113 radio calls went to the emergency trucks, whose crews were able to spend 3,655 hours at routine work, when, without the radio, they would have remained idle. The saving to the Department of Street Railways is estimated at $14,109.19 for the four months. The cost of operating and maintaining the receiving sets and the salary of the additional radio operator required is placed at $907.19, making a net saving to the city of $13,202.11.

The broadcasting at present is done only between 11 a.m. and 3 a.m., except on Sundays and holidays. Later, it is expected that the system will be in force 24 hours a day. It is also planned to equip with radio the six construction trucks now in use by the department, one fire truck, and the track department's two emergency trucks. In addition to its use by the Department of Street Railways, the broadcasting station is used to call the "cruisers" and "flyers" of the Detroit police department. In fact, the station was installed primarily for this service, and the use for the street railways came later. The police cruising cars are equipped with portable receiving sets and have no difficulty in receiving messages while they are running at a high rate of speed.

Auto Truck Sands Track in Utica

BECAUSE track is sanded ordinarily only on the grades in Utica, the New York State Railways has found a small Ford auto truck to be superior in that city to a trolley sand car for this work. It is stated that much time is saved by its ability to cut across from one street to another and that it is cheaper to operate than a railway car. A 4-ft. piece of air hose extends from a hole in the bottom of the truck down to the rail. The position of the free end is controlled by a light steel rod manipulated by a man who sits on the back of the truck, as shown in an accompanying illustration.



Track in Utica Is Sanded by Means of This Small Auto Truck

The flow of sand is stopped simply by pulling up the end of the hose.

In winter this truck is also used to carry around men who salt the track switches. Two men on the truck take the place of about 12 men who formerly were required for this work. During the construction season the truck is used also to deliver materials for small maintenance jobs.

Careful Engagement Reduces Turnover

The Method of Engaging Trainmen on the System of the United Railways of St. Louis Has Secured an Excellent Selection and the Turnover Has Become Negligible—The Forms Used in Employing and Training Men Show the Care Used

THE success of a method is proved by its disuse. This may seem a contradictory statement, but it is true when applied to the employment methods of the United Railways of St. Louis. The plan followed in engaging men is the result of extended experience and has brought into the service such a group of satisfied and satisfactory employees that the turnover has become very low. In fact, the report of the employment department on July 1, 1924, that no new platform men had been hired since the corresponding report of May 1, and that no new men would probably be required until the end of August, shows a notably satisfactory condition of affairs. It should be said that the number of motormen and conductors on the company's payroll on May 1, 1924, was 3,748, which is a large number to keep practically intact in these days of business activity.

Of course, a large factor in this low turnover is the fact that excellent relations exist between management and men, and this keeps down both resignations and discharges, but an equally large factor in the situation is the care taken in the selection of the men in the first place. Every effort is made to discover the unfit man before he is engaged. This is of benefit to both company and man. Where care is taken to select men qualified for the work, the most frequent cause for turnover disappears.

Applicants for employment are first interviewed by Joseph D. Crafton, who has long held the position of employment superintendent of the company and has the faculty of being able to judge very accurately from the manner in which a new man talks and carries himself whether he has the makings in him of a good and steady trainman. Mr. Crafton's practice, when a man applies for a job on the road, is to let him do most of word and listening to him with a great deal of sympathy.

PRELIMINARY APPLICATION BLANKS

This interview being satisfactory, the new man is asked to make out the preliminary application blank, shown in the first form. If the answers to the questions on this blank meet the requirements, the applicant goes to the company's medical director to receive a physical examination. This calls for a test of the sight and color perception of right and left eye and the hearing of each ear by watch and voice, as well as the condition of lungs, heart, spine, etc. The applicant is also asked as to the extent of his use of alcoholic beverages and tobacco. The blank carries front and back diagrams of the human form upon which any peculiar characteristics or marks of the applicant can be indicated by the examiner. This blank is signed by both the applicant and the medical director, and then it is returned to the superintendent of employment.

If the applicant has passed successfully all tests up to this point, he receives a printed copy of the specifications for uniform, and also a more extended form of application blank, on which he enters his full name, date and place of birth, physical characteristics, address, length of time a resident of St. Louis, number of dependent relatives, previous occupation, and name of previous employers. A statement on this blank warns the applicant that $50 in cash will be needed by him for the purchase of his uniform and for living expenses before he begins to earn any wages. The employment blank also carries the following printed agreement, with place for affidavit by a notary public.

> *In consideration* of being permitted to make application for employment by Rolla Wells, receiver of the United Railways Company, I hereby agree with Rolla Wells, receiver of the United Railways Company (hereinafter called "employer")
>
> To deposit with said employer the sum of $5 as a surety fund for the faithful performance of my duty.
>
> To work under instruction on and during trial period, without pay, for such time as said employer may deem necessary.
>
> That if I am discharged, or leave said employer's service voluntarily at any time during or after said trial period, I shall have no claim against said employer for services rendered or expenses incurred by me during said trial period.
>
> That wages are to be paid only for such time as I am engaged in operating or running a car for said employer, or in actually doing such other work as may be assigned by said employer computed at the current rates shown on the employer's printed schedules or bulletins.
>
> That these wages are satisfactory to me, and, if I am employed by the said employer, to work contentedly and faithfully.
>
> That I will make no charge, claim or demand against said employer for the time spent in reporting for duty at the request of said employer or any foreman or agent thereof, or waiting after so reporting before actually beginning work.
>
> I hereby warrant the truthfulness of the above statements, and certify that I can read and write the English language and that I personally filled out this application, and enter into the following:
>
> [Read every word of this carefully as you will be held to a faithful performance of the conditions set forth.]

Further Agreement

> In case I am employed by Rolla Wells, receiver of the United Railways Company of St. Louis, as a motorman I .... hereby agree that I will abstain from the use of intoxicating liquors, and will at all times be strictly temperate; that I will faithfully observe all the rules and regulations governing employees which the management may from time to time establish, and willingly perform all duties assigned me; that any wages earned by, or owing me, shall not be due and payable until the regular pay day of the said employer. When my employment with said employer ceases, I will at once return to him all badges or other property of said employer in my possession, or pay for the same at a price fixed by the said employer.
>
> And I further agree that I will at once return to said employer any badges or other property of said employer, or any property I may have received from any other source arising out of my connection with said employer after I have been discharged, or my employment in any way shall cease, and agree that 25 cents per day can be deducted from

my pay due me for each and every day that I fail to return same, as liquidated damages for such failure.

And I further agree that any wages due from said employer when my employment under this contract shall terminate shall be retained by said employer until said property is by me delivered to said employer.

I am informed as to the character of the work for which I am an applicant, its conditions and requirements, and rate of wages, and I am in earnest in my desire to enter and remain in said employer's service, and as evidence that I am not trifling with the question or uselessly consuming the time of the employer's officials in considering my application, I agree that if I voluntarily leave the employer's service within ninety days after the date of my employment the company shall retain as liquidated damages the five dollars ($5) deposited by me upon entering the company's service.

I have made truthful answer to every question in my application; as a guarantee of which I hereby agree that if at any time it develops that any written answer I have made is untrue or if said employer should find my references or my past record not entirely satisfactory I will accept discharge from the employer's service without protest.

I promise to deal honestly with said employer, and if at any time in the performance of my duty of motorman I fail to use my utmost endeavor to have a fare deposited in the box or to get a proper ticket or transfer or other authorized form of transportation from each passenger boarding car, or if I in any manner become possessed of a fare and do not deposit same in the box, or in any manner prevent the company coming into possession of its rightful fares, I agree to accept discharge without protest.

APP. ________

The following questions are answered *truthfully* by me for the purpose of obtaining this position and shall become part of my application:

1. Are you ruptured? ________
2. When were you last ill? ________
3. Do you use intoxicating liquors? ________
4. Have you a cough or any form of lung disease? ________
5. Have you bladder or kidney disease? ________
6. Have you any defect in eyesight or hearing? ________
7. Have you epilepsy, fainting spells or convulsions? ________
8. Have you brain or nervous trouble? ________
9. Have you rheumatism? ________
10. Did you ever suffer sunstroke? ________
11. Have you **made application or worked** for any Steam, Street or Electric Railway Company? ________

Breaking-In Sheet

To provide myself with a standard uniform in accordance with the rules and regulations of said employer before assignment to duty.

CAUTION

Statements made by you and references given in your application are fully investigated. False statements render you liable to a fine or imprisonment under the Penal Law.

I have read all of the above, I understand it, and sign knowingly and voluntarily.

Two other signatures are required of the new man. One relates to his wages during the breaking-in period and appears on the application blank. It reads as follows:

I agree to break in as motorman on my own time without any remuneration from Rolla Wells, receiver of the United Railways Company of St. Louis. If I finish the breaking-in period, said receiver is to pay me $15 for the breaking-in period (not less than fifteen days), provided I remain in his service ninety days or longer; said payment to be made after I have been in his service thirty days and passed all the requirements. But, if I am discharged or resign, before I have been in his service ninety days, or for any reason fail to remain in his service ninety days, the $15 advanced me shall be taken from any money due me at the time I leave his service. (*Experienced men do not receive any money for breaking in, neither do men who have been a conductor or motorman, in changing from one position to the other.*)

The other agreement relates to the use of intoxicating liquor. Every employee has to sign an abstinence pledge reading as follows:

I, ..., hereby promise that, in consideration of being retained in the service of the United Railways Company, I will, whilst I remain in its service, totally abstain from the use of all intoxicating liquor, both whilst on duty and off, nor will I visit or frequent saloons or gambling places, and I further stipulate that if I violate this agreement, I will accept discharge without notice and will forfeit to the company all wages due me or money in the custody of the company at the time of discharge.

This pledge is subscribed and sworn to before a notary public.

On the day that the new employee files his final application, he also receives his badge. As employee transportation is entirely on badge, the new employee agrees to use it only in accordance with the regulations of the company, to deposit a dollar as security for its proper use and care, and to return it when employment ends or when requested to do so. In case it is not so returned, the employee agrees to pay the company for each day the badge is retained the sum of 50 cents as liquidated damages. For office employees the deposit required for a badge is $2 instead of $1. Two card records are kept of all badges issued, one under the name of the employee and the other under the number of the badge.

After this application for employment has been accepted by the company and the applicant has purchased his uniform, the company's photographer takes two photographs of him for the company's files. One of these photographs shows him with his cap on and one without the cap. The applicant is then assigned to some depot.

FORMS USED DURING INSTRUCTION

When he goes to his depot, the new employee, if a conductor, carries with him a blank like the second one reproduced in which the superintendent of employment authorizes him to receive instruction. A blank very similar to the one illustrated, but addressed to the motorman instructor, is used for applicants for the position of motorman. As will be noticed, the blank carries space for the signatures of both employee and instructor when the new man has become competent to operate a car so far as that particular instruction goes. During this period of instruction, the company keeps a record of the names of the instructors for each new man on what is called a "breaking-in" sheet. The upper part of one of these sheets is reproduced. In addition to the names of the instructors and the time they spent with each man this blank contains, at the bottom, space for the signatures of the two supervisors and the superintendent in charge, the name of the depot to which the man is assigned and the name of the foreman. When considered by these officials to be competent, the man is told to report to the employment office for his final instructions.

At this time he brings his filled-out "breaking-in sheet," which is stamped with the date and the number of days that he has been breaking in on the road. He then receives his "ready for work sheet," illustrated, in which he acknowledges the receipt of his badge, ticket punch and pocket book, all of which he agrees to surrender on leaving the employ of the company or pay for them at a definite price. This form also serves as authority to the division superintendent to put the new man at work. At this same time the new man signs and dates another card, known as his "signature reference card," which goes to the general timekeeper, who keeps these cards on file for reference as to signatures. At the same time he receives a card explaining that every day of the year the name and number of hours work by each of the conductors and motormen employed reach the accounting department to be entered on the payroll. To avoid errors in crediting this time, experience has shown that observation of the following rules is essential:

1. That the signature be made the same in every instance.
2. That the name be plainly and legibly written.
3. That the pencil be used rather heavily, making the signature plain and black.
4. That the signature bear either the usual two initials, first name in full with middle initial or, when the person has no middle initial, the first name in full, though usual abbreviations, such as Geo., Jno., etc., may be used, if desired.

Before motormen are sent to the depots to which they are assigned, they go back to the motorman and instructor for final instructions, but conductors go immediately to their depots.

During their breaking-in period both conductors and motormen are taught the proper way to fill out an accident report. The company uses two forms of accident reports, one to cover collisions with vehicles, persons or cars, the other all other kinds of accidents. The instructions at the top of the blank say:

> Conductors and motormen are required to make written report of all accidents, disturbances or occurrences out of the ordinary. Collisions, accidents, persons falling on the car, falling getting on or off, falling approaching the car or after they have safely left the car, fights, quarrels, disputes as to fares, transfers or change, injuries from any cause, even though the persons may say they are not hurt; report it all; do not try the case and conclude that a report is unnecessary; that is the duty of our attorneys after reading your report. Give names and addresses of all injured persons and witnesses. Take pains in making report; write plainly, conductor and motorman both signing same report.

Before they start in, each employee receives a rule book, for which he signs a receipt and agrees to return on request or when he leaves the service; a map of the city of St. Louis, showing the tracks of the company and those of connecting electric railways; an up-to-date list of the numbers of lost or stolen badges, so that these badges can be taken in if they are presented for transportation, and a witness slip book. He also receives three envelopes addressed to the superintendent of employment, which he is asked to send to three different persons for letters of reference, to be mailed back direct to the superintendent of employment. Conductors also receive a witness slip book and punch and motormen a small book of instructions on the use of the Economy meter. The company also has a blank form of letter used to send to references.

Card Used for Motormen's Record

All of these forms, when filled out and returned to the employment and record department, are filed in a special envelope, known as the application envelope, with appropriate filing data on the face of the envelope.

Records After Engagement

The company keeps a card list of all employees in the general form of that illustrated on this page. The one shown is on manila stock and is for motormen. A similar card on blue stock is used for the records of conductors. Supplementary cards, somewhat smaller and of the same colors, which can be clipped to these cards, are employed to record any changes in the wages per hour paid to the individual employees.

No wages are paid to new employees for their time during their breaking-in period unless they remain in the service for 90 days. In that case, conductors receive $10 for the last ten days and motormen $15 for their last fifteen days of breaking in. When these payments become due, they are made on a special form of check on which the application number, badge number, date of employment and name of employee are given, with a space on which the employee receipts for the payment.

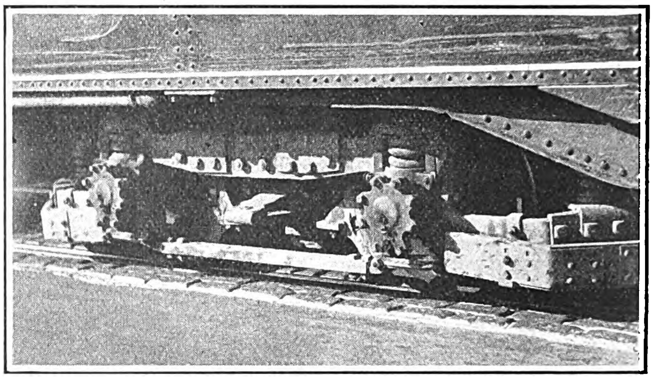
WHEN AN EMPLOYEE LEAVES

When a conductor or motorman leaves the service or is suspended, the superintendent or foreman in his division forwards to the employment and record office a statement on a blank provided for that purpose, giving the reason for his discharge, resignation or suspension, the date of his employment and his application number, badge number and future address. On receipt of this information, the employment office immediately notifies the claim department, sending at the same time a record of all accidents in which that particular conductor or motorman was concerned, so that if the claim department needs his testimony in any case, a deposition can be taken from him before he leaves.

After a conductor or motorman has left the service, his records are transferred from a "live" to a "dead" file, but they are retained intact for possible use.

Boston Transit Problems Explained in Radio Interview

AN INTERVIEW with Edward Dana, general manager of the Boston Elevated Railway, Boston, Mass., in which many questions of popular interest regarding that system were answered and broadcasted, took place on the evening of Oct. 24 at station WEEI of the Edison Electric Illuminating Company of Boston. Mr. Dana has given a number of radio talks in times past on the Boston transit situation. Mr. Dana asked and answered questions on traffic, mileage, employees, revenue, safety in operation, motor bus operation, electrification, etc. He concluded his talk by narratine the most humorous story that has come to his attention in the long life of his service on the Boston "L."



Hyatt Roller Bearings Are Mounted in Totally Inclosed Journal Boxes Arranged to Be as Nearly Oiltight as Possible

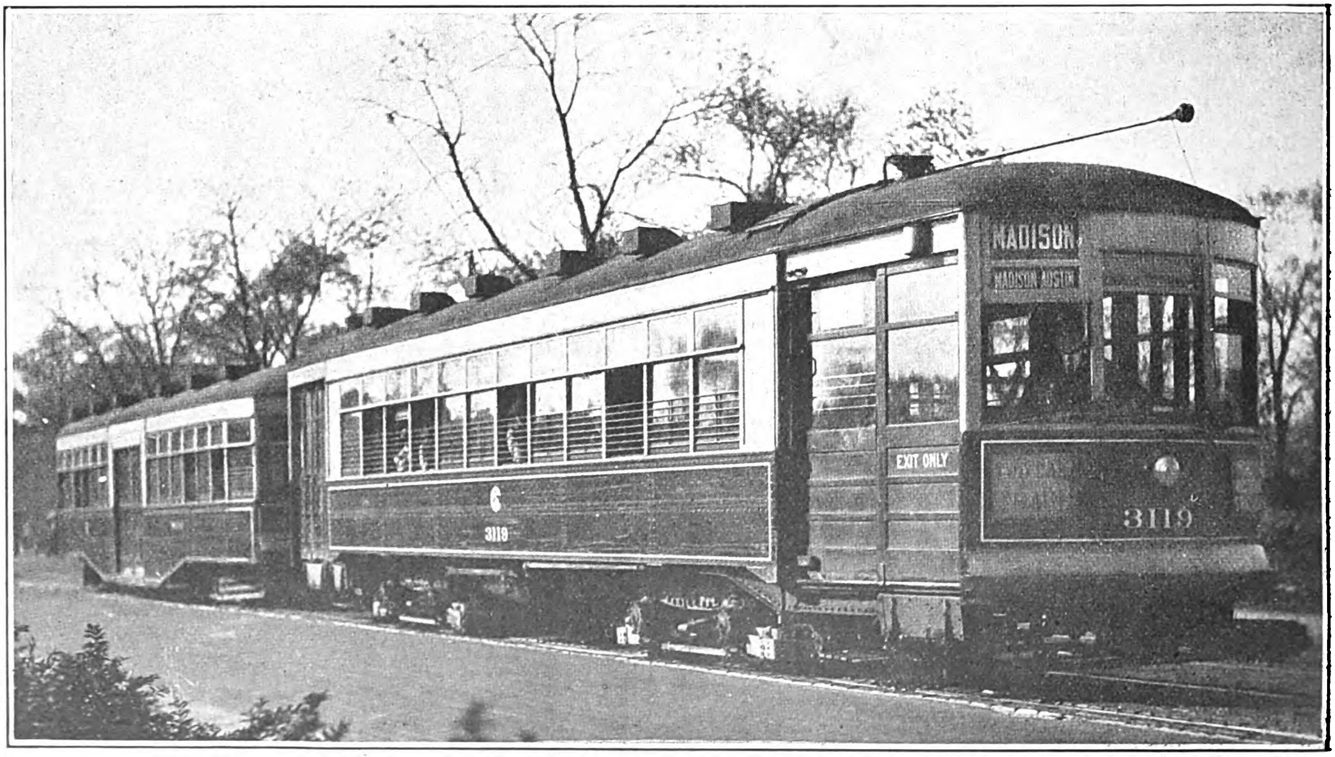
Chicago Surface Lines Trying Roller Bearings

A SAMPLE train of the Chicago Surface Lines consisting of a motor and trail car unit operating on the Madison Street line has been equipped for experimental purposes with Hyatt roller bearings on all journals of both motor car and trailer.

This installation has been made to obtain data on the effect of these bearings on the power consumption, and also to determine by actual operation over an extended period of time the way in which this type of bearing will stand up under the operating and maintenance conditions encountered.

A hardened steel sleeve is pressed on each journal to take the wear of the rollers, and the front covers of the boxes are tightly bolted in place to make the boxes as nearly oiltight as possible.

As the installation has been in service for only a few weeks, no definite data on the relative power consumption on this train as compared with standard babbitt-lined journal bearings is as yet available. However, in these few weeks of operation, no difficulty has been experienced.



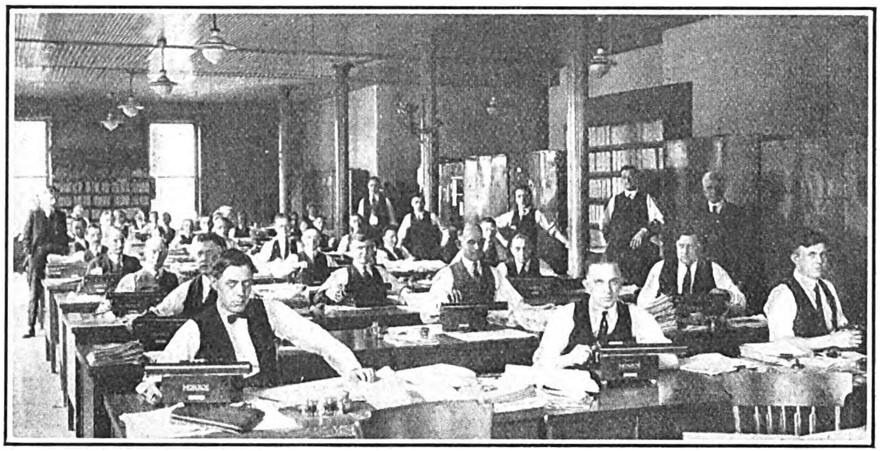
Roller Bearings Are Being Tried Out on the Journals of This Two-Car Train Operated on the Madison Street Line, One of the Heaviest of the Chicago Surface Lines

Applications of Modern Methods in Accounting Practice

By W. L. Davis

Auditor Lehigh Valley Transit Company, Allentown, Pa.

In This Concluding Installment of This Series on Present-Day Electric Railway Accounting Practice, the Principal Topics Discussed Are Budgets, Fixed Capital Records, Daily and Weekly Reports and the Use of Machines in Accounting Offices



A Typical Modern Railway Accounting Office, Showing Extreme Use of Tabulating Machines

THE executives of any electric railway company should be furnished with operating and construction budgets, either annually or at specific periods. These budgets should include not only the estimated income and expense for the particular period covered, but also the construction work considered necessary or desirable during the same period, the net return after operating expenses, fixed charges and dividends being supplemented by such new money as might be required for the company's construction program.

While the budget may be compiled by the accounting department, it is obvious that the basic figures used be furnished by operating engineers and others familiar with the physical requirements of the company, this information being supplemented by a study of economic conditions to the extent that earnings may be forecasted to a comparatively accurate degree and increases or decreases to operating expenses may be anticipated to some extent.

In the preparation of the budget, the income account should receive attention before the amount of new money is determined. In order to do this it will be necessary to study current conditions and determine the increases or decreases in the earnings as compared with the prior year, taking into consideration any economic conditions which may affect the return. If the earnings are compared from day to day and month to month the percentage of comparison arrived at may be applied to the earnings of the year just passed and figures for the coming year forecasted accordingly.

Operating expenses should be reviewed in detail and present average costs applied to the operating and maintenance schedule as determined for the coming year by the operating department. This should also take into consideration economic conditions. The schedule of operation and maintenance work should of course be compiled on a tentative basis for comparison with the income as forecasted and changes made accordingly before the budget is finally prepared and furnished to the various departments. The operating expense budget should be compiled in such a way that each department head will get the benefit of the estimated cost for his department as he should compare the estimates with the actual costs from time to time as they are incurred. The Operating Expense Budget should also contain the necessary figures on general expenses and taxes. These figures can usually be determined by the accounting department to a fairly accurate degree.

In connection with the operating expenses, there should also be included any contemplated expenditures for increasing the amount of material on hand for operating purposes, with particular reference to fuel stock. Fixed charges are easily determined and may be included by the accounting department as required. Dividends should be included in the budget only after the company's policy is determined.

Construction expenditures should be included after the cost of the various jobs has been determined by the department heads responsible. It might be well to compare the contemplated construction expenditures with the result of the estimated income account before the budget is finally prepared, as it might be necessary to eliminate some of the items, particularly if conditions are such as to render new financing difficult.

After the construction expenditures are finally determined upon, the amount of new money required should be computed and reflected in the budget either as cash to be raised from the sale of bonds or as an item subject to short term financing. This latter subdivision of course depends to some extent upon the class of construction work contemplated and the subdivision of the final accounting between capital and non-capital expenditures.

The preparation of the budget as described above cannot be handled with any degree of satisfaction unless the records of the company are drawn up in such a way that

---

EDITORS' NOTE.—The previous installments of this article appeared in the issues of this paper for Sept. 27 and Oct. 4.

the revenue accounts and details of charges to operating expenses are readily available. Proper comparisons cannot be made between the actual transactions of the prior year and the contemplated operations of the coming year unless the factors entering into both are easily comparable with each other.

It would appear that there is a responsibility on the part of the head of the accounting department to prepare his daily records in such a way that this information can be had, and toward this end it is recommended that the daily transactions be recorded in self-analyzing form as far as possible.' This information should be available to the operating and construction engineers who are responsible for the preparation of the basic figures for the budget.

It is obvious that the conditions in our industry are such that it would be somewhat difficult for a department head to live up to the letter of his budget and at the same time take care of unforeseen requirements as they come up, and accordingly, it will often be necessary to prepare revisions of the budget and supplements thereto. These should be prepared along the same lines as the budget itself and should cover the same period.

It will also be advantageous for the company to prepare at different intervals a statement of estimated cash receipts and requirements for a stated period ahead. These estimates, of course, contain the same elements as the budget, but as the budget is necessarily based upon figures which contain a certain number of accrued accounts and other similar transactions not representing actual cash receipts and disbursements, the budget and cash requirements statement can hardly be expected to parallel each other in all respects.

The statement of cash receipts and requirements should reflect the months in which the receipts may be expected and payments made, together with the dates at which temporary loans are to be made during the year. In order to prepare this statement accurately it will be necessary to review the items set up in the annual budget with a view toward eliminating from the cash statement any items representing large quantities of material to be issued from stores and similar items which must be charged to the operating and construction accounts for which no cash need be spent during the particular period. This statement should also be reviewed from time to time and changed in accordance with current conditions.

FIXED CAPITAL RECORDS

One of the comparatively recent developments in the electric railway industry is the fixed capital record, or perpetual inventory of property. This is not strictly an accounting department function, but the preparation and handling of a record of this kind is dependent to a great extent upon the records kept by the accounting department, both past and present.

A fixed capital record should include all of the various property units, and should be based upon a plant inventory compiled as of a specific date. This basic inventory is supplemented by additions covering new property and withdrawals covering units withdrawn from service for one reason or another. After costs are applied thereto and recognized elements of intangible costs are added, the fixed capital record may be used as a property valuation.

The preparation of the physical data and the application of intangibles are usually handled under engineering supervision, but it is often necessary to refer to the records of the accounting department to secure cost data of various kinds. This work has resulted in revealing numerous defects in the accounting records of former years, and although the present-day auditor cannot do much to correct the mistakes and inaccuracies in old records he should profit by such omissions and handle his current work in such a way that construction costs may be determined to a reasonably accurate degree.

In handling construction costs, the best results can be attained by using the work order method. A separate work order is assigned to each construction job and charges are made accordingly during the process of the work. Each work order should be reviewed by the accounting department in advance in order that proper distribution of the costs by accounts may be determined. The daily and monthly charges to the work orders should also be distributed as to accounts as the costs are incurred.

Overhead charges should be determined and applied monthly wherever possible. After the work is completed, the cost thereof should be analyzed as to labor, material, and other elements, and the complete analysis subjected to a check with the physical conditions. After the costs are subjected to the physical check, results of the work order can be included both in the general ledger and fixed capital record with the assurance that the entries in both records contain the same elements.

Property retirements can be recorded very readily if the company maintains a fixed capital record, as the description of the retired property as set forth in the fixed capital records may be supplemented by estimated costs of installation.

The fixed capital record can also be used in determining divisional investments and operating costs and will be found valuable in other ways. The initial cost of such a record is quite heavy, but if accurate construction accounts are kept, it will not be difficult to keep it up to date, thereby affording a basis for a valuation at any time.

DAILY AND WEEKLY REPORTS

It is very important that the executive department be advised of current conditions as reflected by the accounting department records, but the requirements of the various companies are so widely different from each other that no two managements will expect exactly the same kind of information along these lines.

The accounting records of any company can be arranged in such a way that they could, if necessary, be closed daily, but as this would entail considerable expense and require a large organization it is hardly necessary to consider it at this time. However, it will not be difficult for the accounting department to furnish daily information to the executive covering certain functions of the property. Most electric railways account for their receipts on the daily basis and it is a comparatively easy matter for the accounting department to prepare a summary of such receipts from the original records.

These daily reports should be made divisional in form and show the day's earnings on each division as compared with the corresponding day of the prior year, tabulating increases and decreases on each line, with percentages if desired. This report might also show the corresponding figures for the month to date, which can easily be compiled in cumulative form from day to day.

In this connection it might be said parenthetically that the figures for the previous year may be tabulated in advance.

It might be of interest to the operating executive if this daily report would show not only earnings, but car mileage and car hours on the various lines from day to day during the month, thereby avoiding the delay in receiving the complete operating report, as the final report must necessarily be delayed for some time after the month's accounts are closed. This information might also be supplemented by tabulations showing the various operating costs per car mile and car hour if such information is considered necessary. This report can be made to include as many daily figures as the executives may need, and if the required figures are prepared and tabulated daily as a part of the routine it will not present any serious difficulties to the accounting department.

Daily reports of cash should also be prepared for the information of the treasury department and other officials who may be interested. These reports can also be compiled on a daily basis without much difficulty if the routine is established accordingly.

USE OF MACHINES IN MODERN OFFICES

It would be manifestly difficult for any auditor responsible for the efficient handling of an up-to-date accounting organization to attempt to get along without some of the up-to-date machines designated to reduce work and promote accuracy. We are all more or less familiar with some of these machines, but in an article reviewing the requirements of the present day accounting department it will not be amiss to compare some of the work now being done with what had been done prior to the development of this apparatus.

Almost any one knowing anything at all about office routine understands the operation of the adding machine, but it has only been during the past twenty years that these machines have been used to any great extent. In former days it was necessary to prepare trial balances and monthly reports by hand and add them mentally, but if the 1924 office were to be handled strictly on that basis it would be almost impossible to handle the current detail requirements without a substantial increase in the payroll, which would be entirely out of line with our present ideas of what this kind of expense should be.

Adding machines, both listing and non-listing, have a large field of usefulness and if properly handled will enable the accounting department to save many times the interest on the investment in the course of a few years, but on the other hand if they are not properly used they can become a burden to the organization. While it undoubtedly promotes accuracy to use these adding machines for as many different purposes as possible, on the other hand their use should not be encouraged to such an extent that the ordinary employee cannot handle the simplest kind of addition without them. The requirements of the department should be studied and machines used wherever practicable, but there are numerous small self-checking computations which properly trained clerks can handle mentally.

The routine work in the accounting department is such that computation of averages, percentages, and proration schedules are required almost continuously, and it would be manifestly difficult for any office management to handle the requirements without the use of some one of the numerous machines designed to handle problems in multiplication and division. There have been substantial developments along these lines during the past twenty years and the initial investment on these machines and the expense in carrying them are almost negligible in comparison with the benefits derived from their use. However, the use of these machines can also be developed to such an extent that the office employees are practically helpless without them, and while it is somewhat difficult to avoid this situation and still rereceive the benefit of the use of these machines, the auditor should watch the conditions carefully and see that the mental capabilities of his employees do not become neglected.

The development and use of the typewriter during the past twenty-five or thirty years has also brought with it a number of new inventions designed to take care of the preparation of numerous copies of reports, schedules, analyses, contracts and other tabulations and documents of every description. These inventions have enabled the modern office to turn out reports with twenty-five, fifty and one hundred copies, which would have been almost impossible under conditions that existed a generation ago.

The present requirements of the accounting department include the preparation of numerous daily, monthly and other periodical reports on financial conditions, income, details of revenue, details of expenses and the like, and as these statements usually show both red and black figures it was necessary to develop some kind of operation wherein the two could be handled at the same time. In this direction the recent inventions of the duplicating machine companies have been almost invaluable. It is now possible to insert in the typewriter a ribbon with two colors of heavy ink on it and tabulate a statement showing both red and black figures with one operation. This sheet can then be used in connection with a duplicating machine and as many copies prepared as would be required under ordinary conditions. These machines, however, are subject to some limitations, as it is not possible to procure more than one hundred legible copies at one operation and often conditions are such that only half that number can be had. In order to take care of this difficulty, a stencil machine may be used in connection with which the typist can prepare a master stencil from which copies can be run off almost indefinitely. In connection with this operation, however, it is rather difficult to insert red and black figures on the same tabulation without performing considerable additional work.

COMPUTING AND TABULATING MACHINES

The detail work in the large electric railway office is such that the computing and tabulating machines can also be used to advantage, especially in preparing revenue and traffic statistics and similar information where the bulk of the work is such that the assorting and assembling of such figures by hand would entail a prohibitive cost. The man in charge of this work should keep in touch with his requirements to such an extent that he can recommend the installation of these machines when economies can be effected.

During recent years the preparation of freight waybills has undergone a considerable change. In former times these waybills were made by hand and copies made by means of old-fashioned copy book and press, but later this work, to a great extent, was superseded by the use of machines from which numerous copies could be prepared at the same time either by hand or by machine process similar to that of the typewriter.

The work in connection with counting daily cash receipts and ticket collections has also been facilitated during recent years by the invention of ticket counting and coin counting machines. By the use of these machines the accounting department has not only reduced the time required in handling this detail work but has also developed the checking of conductors' returns to a more accurate degree than was possible in the past.

There are numerous other machines of different kinds which the modern accounting department can use, and it will be of considerable advantage to those in charge of the accounting departments of the various companies to keep in touch with these inventions and see that their companies get the benefit of them as soon as possible, with due consideration for the usefulness of the machine to the particular organization and the return on the investment to the purchaser.

In conclusion it might be said that the man at the head of the accounting department of the modern electric railway should build up an organization and an accounting system that will enable him to handle present-day requirements promptly, satisfactorily and economically, and at the same time give him enough time away from routine and special requirements that he can develop his own capabilities and study the present and future requirements of his position.

Educational Program in Boston

Boston Elevated Railway Announces Five Series of Departmental Group Conferences for Employees, with Other Advanced Courses — Arrangement with Massachusetts Department of Education Effected

THE program of the educational courses to be open during the season of 1924-1925 to employees of the Boston Elevated Railway are announced in a circular just issued by Edward Dana, general manager. Altogether there are four series of group conferences for male employees, conducted respectively in the transportation, rolling stock, maintenance and power departments, and a series of conferences for the women employees, for the purpose of informing them as to some of the general problems of the railway. In each case, the conferences begin with a half-hour talk on some specific topic by a well qualified speaker, followed by a discussion occupying not more than 1 hour.

In addition to these group conferences, there will be a few general meetings during the season, at which the general manager, his representative, or an outside invited speaker will give a perspective view of some of the larger aspects of electric railway operation. A third branch of the educational work on the Boston Elevated is an arrangement with the Massachusetts Department of Education, Extension Division, by which certain courses in applied mathematics, practical electricity, and dynamo electric machinery will be open to employees if a sufficient number enroll. All these meetings begin early in November.

Most of the group conferences will be held in the rooms of the instruction school which has been fitted up at the Sullivan Square station, but some of the conferences of the rolling stock group will be held at different points in the Everett shops.

A brief summary of the scope of the topics to be pursued by the various departmental groups follows:

The maintenance group, John B. Flaherty, chairman, will hold 19 conferences, taking up such widely varied topics as track, signals, stores, equipment, accident prevention, relation of maintenance department to state, city, and town officials and to labor organizations, etc. No fee is charged for this group.

The power group, Joseph A. Howard, chairman, takes up the operation and maintenance of the steam equipment with special reference to combustion, and the operation and maintenance of the electrical equipment, including the substations and distribution. If sufficient enrollment is secured in this group, arrangements may be made with the State Department of Education, Extension Division, to furnish the instruction in the course. A nominal fee will be charged for this instruction, but it will be refunded by the trustees to all who complete the course to the satisfaction of the Department of Education.

The rolling stock group, John Lindall, chairman, will hold 20 conferences on such topics as car construction, car body repairs, trucks and truck maintenance, railway motors, control equipment, air brakes, shop practice, and buses. No fee is charged in this group.

The transportation group, E. A. Kelley, chairman, will hold 20 conferences on such topics as accident prevention and reports, relations with employees, treatment of passengers, carhouses and stations, the bus and its place in transportation, power saving, fare collection on cars, traffic surveys and time-tables and handling street traffic. No fee is charged in this group.

The women's group, Miss E. E. Mullen, chairman, will have 12 informal talks by experts if there is sufficient enrollment. The topics were selected by a committee of women employees and include accounting and auditing, accident prevention, collection and registration of fares, economical operation of cars, relations with employees, maintenance of track, snow fighting, public relations, and financial features of electric railroading. No fee is charged in this group.

Buying Coal for Employees of a Small Railway

A SIMPLE method of buying coal for employees and distributing it to them has been followed for several years by the Beech Grove Traction Company, Indianapolis, Ind. Coal is purchased by the railway in carload lots. The car is placed on a convenient siding and the employees send and get the coal, paying the cost of haulage themselves. The company is paid for the coal on the installment plan.

Trucks Used by Railway for Local Freight Haulage

The New York State Railways, Utica Lines, Has Inaugurated a Trucking Service in Addition to Its Regular Electric Express and Freight Service

By F. W. Watts

General Express Agent New York State Railways, Utica Lines

SOME time ago the New York State Railways, Utica Lines, found that the freight and express department was steadily losing business to various unorganized motor truck competitors. In spite of the irregular service furnished by these competitors, their fluctuating rates, and the irresponsible method of operation, the merchants and wholesalers of the district were diverting more and more of their business from the railway to the trucks. It was felt by the management, therefore, that the institution of a financially responsible line, with regular service, reasonable and fixed rates and proper equipment for all year operation would recapture the business and provide a new source of revenue for the railway.

These Simple Forms Have Reduced to a Minimum the Amount of Clerical Work Necessary

With this end in view a trucking service was inaugurated, operating from Utica as the center, and serving the towns of Rome, Frankfort, Ilion, Mohawk, Herkimer, Little Falls and Dolgeville. The equipment used consists of two 3½-ton White trucks and two 2-ton White trucks with special covered bodies. The type of vehicle used is shown in an accompanying illustration. The trucks operate within an area outside the city, handling the express business as well as special truckload lots of fruit, vegetables and manufacturing material. The cars continue to handle the long distance and heavy freight.

At the very outset it was discovered that the problem was not only one of transportation, but also one of salesmanship. Business could be secured in the face of the existing intense competition only by a picked personnel. A crew of two men was placed on each truck, to drive, load, and unload and also to secure business. This arrangement has resulted in a considerable saving of time in loading and unloading, and in a gratifying increase in traffic on account of the success of the crews as business getters.

MOTOR EXPRESS
UTICA RAILWAYS MOTOR EXPRESS
5

New York State Railways Does Local Express Business with Trucks of This Type

For example, when delivering goods to a dealer in a small town from a wholesaler in the city, the crew carries order forms and makes it a point to inquire if the dealer wishes to order anything from his wholesaler the next day. In case he does, the order is taken by the driver, presented to the wholesaler the same afternoon, and the goods are delivered by the driver to the dealer the next morning. Trucks call daily on every dealer and wholesale shipper in the district. These truck calls are in addition to the constant canvassing which is done by the general express agent and by his assistants.

Claims for loss or damage are less with the trucks than they have been with the company's electric cars. This is due largely to the fact that the truckmen have an eye on the load all the time, thus preventing loss by theft or mishandling. Moreover, the chance of damage in transit is reduced by the fact that the material is handled only twice—once in loading and once in unloading—instead of several times, as might be the case if it were transferred from the truck to an electric car, and then from the car to the truck again for delivery. The fact that the goods proceed in an almost direct line from the shipper to the consignee has reduced to a minimum the time required, and has also eliminated the expense of operating freight terminals. While the rates secured are not as high as those paid for shipments by railway, the cost of operation for doing this type of business is considerably less than it would be by electric car. Combined with a reduction in the overhead expense and damage claims, this has made the motor truck operation a profitable adjunct to the company.

Lay Your Money on the Counter*

The Way to Tell the Railway Story Is to Buy Space in the Advertising Section of the Newspaper, Not to Beg Space in the News Columns

By W. P. Strandborg
Publicity Manager Portland Electric Power Company

WE ARE confronted with a strange situation in our present-day affairs. The two greatest constructive forces shaping the social, political and economical destinies of our American people are the public utilities and the public press. And yet as monumental institutions of progress they understand very little about each other.

A mighty change has been coming over the public utility industry of late and it is one of the most hopeful signs for the future. Only a few years ago the public utility men of the country believed that there was only one department of the newspaper business which was of any concern of theirs. That was the news columns. By all odds the most valuable part of the newspaper is the one which the average utility of ten years ago thought it was perfectly proper to raid whenever it wanted to tell some message to the public. Utilities sincerely and honestly believed that they had a right to full and free access to the news columns for every kind of utterance, no matter whether it had legitimate news value or was of the most malicious type of propaganda.

There are still quite a number of utility men in the United States who hold the same pitiful misconception of what a newspaper's duty is to its readers with reference to the selection of material that is to go into its news columns. I have no more patience with a newspaper which will accept and publish free of charge in its news columns, without weighing it scrupulously in the balance of public interest, material offered for publication by a utility, than I have with the public utility company which tries to sneak such stuff into the papers. In cases of that kind, the newspaper man and the utility man are equally discreditable to their respective businesses.

For a number of years a small group of the younger generation of utility men has been striving valiantly to hurl forever into the limbo of forgotten things the pernicious press agent and free propagandist. We regard him as an anachronism and an unmitigated evil, and I am happy to say that we can report substantial progress in all sections of the country. We started so late, however, and have had so much ground to cover that up to the present time we have hardly been able to more than scratch the surface. We are pledged to work with our managers and executives in the public utility industry to the end that we may convince them that the best policy is to place the copy on the counter with the cash in the business office downstairs. If we want to have any dealings with the city editor and his staff upstairs, we should carefully search our pockets to see that they are not contaminated with any typewritten copy for the news columns.

We honestly hope that the day will come when we can have the daily newspapers of the United States coming to us and asking us for news, and so far as possible to keep ourselves free from even offering a suggestion to a newspaper as to what might or might not constitute a news story relating to any of our activities, policies or business affairs.

Progressive Policy Adopted by Utility Companies

We hope that we may enlarge, so that it will cover the entire country, a policy which has been recently adopted by some of the larger and more progressive public utilities in dealing with the editorial and news departments of the daily press. We believe that every public utility company in the country, large or small, should have a man within the organization who has some knowledge of the newspaper business. This man should make it a point to become thoroughly conversant with every phase of his company's activities in the community. Then he should make it a point to visit frequently, perhaps once or twice a week—or oftener if necessary—the city editor, the reporter who handles the industrial beat, and the editorial writer who comments on industrial matters.

This representative of the public utility should sit down and tell the city editor or the reporter or the editorial writer, or all three of them, just exactly what is going on in his company, what it is doing, what plans it has for future expansion, what it is doing in the way of making its service more adequate and satisfactory. So far as he possibly can, he should add to the mental equipment of these three newspaper men a groundwork of information about his company that will be of value when any real item of interest "breaks." The utility company can never give a newspaper too much information about its business. The representative of the utility company who calls upon the newspaper should be a man of absolute integrity and reliability and he should be permitted to discuss the affairs of his company with the utmost frankness.

This utility man, who is generally dignified by the title of "publicity man," should supplement these visits to the newspapers by keeping closely in contact with everything that goes on in his company that might develop into something which his judgment and experience tells him has news value. He should then telephone the city editors if they think the matter in question has any news value. He should also offer to prepare that material in news form if the city editor thinks it is worth printing, or he should tell the story to a reporter in case it is a matter which can be handled over the phone.

The awakening which has come to the public utility industry is not limited alone to a change in the method of dealing with the new staffs of the press, but carries with it a growing realization that sound business principles demand that the dealings between the utility company and the newspaper must be be largely confined to the business office and more specifically to the advertising manager of the newspaper. Nowadays the more the utility company turns its back on the city editor, the more it faces eyes front to the advertising department, the more sure the utility will be of accomplishing one of its major objectives, namely, the creation and establishment of better public relations. That is why the Public Utilities Advertising Association is advocating so strongly the putting of cash with our copy on the counter.

A high standard is maintained in public utility advertising copy. A survey of the entire public utility field in the United States through the national vigilance committee of the Associated Advertising Clubs and the forty Better Business Bureaus operating in our most important metropolitan districts shows that in the past 12 years, since the "Truth in Advertising" movement was inaugurated, there has not been found a single piece of questionable electric railway advertising copy. Moreover, in the rare instances where the Better Business Bureaus have suggested to other utilities that a change in their copy would conform more closely to the standards set up, these companies have always and without question made the suggested changes. Indeed, a number of the Better Business Bureaus managers have said that if other advertising was as clean as that of the public utilities, they would have to look for another job.

*Abstract of a paper presented at the meeting of the Inland Daily Press Association, Chicago, Ill., Oct. 14, 1924.

To Advance Railway Interests

Purpose of the Ohio-Pennsylvania-West Virginia Organization Is to Develop Passenger and Freight Traffic

MEETINGS have been held at the offices of the Steubenville, East Liverpool & Beaver Valley Traction Company at East Liverpool, Ohio, and a constitution and by-laws have been prepared for the Tri-State Electric Transportation Association. These will be presented at a meeting for permanent organization purposes. H. O. Allison, commercial manager of the Beaver Valley Traction Company, New Brighton, Pa., who sponsored the organization, is temporary chairman.

The by-laws were prepared as the work of a special committee composed of C. M. Marsh, superintendent of the Wheeling Traction Company, Wheeling, W. Va.; J. Howard Maxwell, president of the Steubenville, East Liverpool & Beaver Valley Traction Company, East Liverpool, Ohio; Frank E. Wert, director of public relations of the Pennsylvania - Ohio Electric Company, Youngstown, Ohio; F. B. Lawrence, general manager of the Newell Electric Railway, Newell, W. Va., and E. O. Shyrock, general manager of the Youngstown & Suburban Railway, Youngstown, Ohio.

The constitution stated that the purposes of the organization were the cooperation of the members in the development of the use of electric railways for passenger transportation and freight traffic; the dissemination of information about the service rendered and the economy and convenience of electric railway travel.

If the plans materialize close to 1,800 miles of street railway property will be represented in the association. In the Ohio section buses are being operated quite extensively and the question of admission of such concerns was paramount when the selection of a name was considered. It was held that the association was primarily and fundamentally for the purpose of advancing the interests of electric railways, and that while there was no objection to the admission of railways operating buses and the consideration of them in the transportation need, yet the door was closed to the independent operator of buses.

The committee in charge of the organization work will recommend, among other things, that a booklet be prepared descriptive of the territory and containing a map showing the electric railway lines, time-tables and fares. This would be a source of information for the public placed in public places such as hotels, restaurants, etc. The committee believes that time-tables, advertising cards and the like that are purely local to individual lines can be put out at the expense of the company issuing them. These should be distributed and available at ticket offices, hotels and other points throughout the entire territory. The committee believes that special attention should be given to the investigation and bringing about of a connecting interurban service, and to the interchange of ticket rates and freight haulage for the various companies. It also will recommend a coordination of effort and policy in standards required and in training of employees so that they may be conversant with the particular railway facilities in their territory.

Job Analysis Promotes Safety*

Accidents Can Be Prevented by Study of Hazards—By a Similar Process, Courtesy Can Be Taught

By JOHN J. CONNORS
Safety Supervisor Nashville Railway & Light Company

THE greatest cause of industrial accidents is carelessness. Statistics show that 90 per cent of all accidents could be prevented by the exercise of greater care. After mechanical safety devices have been provided and unsafe conditions are corrected, thereby eliminating the 10 per cent of accidents attributable to these factors, the safety supervisor must direct his efforts toward the elimination of carelessness.

With this objective in mind, the writer early in the year 1923 adopted the job analysis method in investigating the causes of such accidents. Carelessness was thoroughly analyzed. Discussion developed that a man does careless things because of contributing causes such as lack of sleep, worry, grief, anger, hatred, malice, envy, and false estimate of values.

A lineman in climbing a pole, as he nears the top, must negotiate his body through two sets of wires. The secondary or low-voltage set are 18 in. below the primary or high-tension set. For some reason, he passes the harmless set of wires without recognizing this fact and comes in contact with the high-voltage wires and is killed. What is the cause of this accident? Did the lineman enjoy a full period of refreshing sleep the night previous? Was his mind free from worry, grief or other disturbing factors? In his estimation, was doing the job in the least possible time more important than his personal safety?

The accompanying table is an example of the way the hazards of the lineman's job can be analyzed. The hazards of operating a street car can be analyzed in a similar way.

This method of reasoning may be applied also to improve the quality of service, by specifying the things that trainmen should do, and should not do. A small number of additional fares per day may change a deficit into a profit. With this in mind we organized in April of the present year a group of 25 motormen and conductors in what we termed a "salesmanship class." We listed on the blackboard a few factors that were pertinent to salesmanship. The group decided that courtesy was the most important factor, and therefore, this was analyzed. To date, 175 men have completed this analysis, spending one-half day on the company's time for a few days. Using the case method, in which actual situations arising in the daily work of street railway motormen and conductors were mentioned, a thorough analysis of courtesy in dealing with the public was developed, similar in a general way to the safety analysis of the lineman's job.

SAFETY ANALYSIS OF OVERHEAD LINE WORK

Job	Operations	Hazards
Setting poles	Raising small end	Pole turning.
	Placing deadman	Deadman slipping and pole falling.
	Placing pikes	Pike slipping.
	Rocking up	Deadman improperly set.
	Raising pole with pikes	Pole turning and pikes slipping.
	Changing pikes and ground	Pikes slipping.
	Lining up	Pikes slipping.
	Tamping	Danger of knocking pikes out.
Stripping pole	Climbing	Tacks in pole. Knots in pole. Pole rotten. Safety belt in wrong position. Pole giving way.
	Transferring primaries	Defective rubber gloves. Touching other wires. Touching ground.
	Taking off crossarm	Dropping crossarm.
	Loosening guys	Guys coming in contact with other wires.

---

*Abstract of a paper at an extra session of the National Safety Congress, Louisville, Ky., Oct. 2, 1924.

Many Types of Locomotives at the Berlin Railroad Exposition

CONSIDERABLE space at the railroad exposition at Seddin, near Berlin, which opened on Sept. 24 and continued until Oct. 19, was devoted to electric locomotives and motor cars for rapid transit service. The exhibitors of electric locomotives included the German State Railways and all of the principal German builders. Single-phase equipment predominated. Storage-battery locomotives and motor cars for the Berlin rapid transit system and various tramways were also shown. This exposition was held under the auspices of the Verein Deutscher Ingenieure.

One of the most novel exhibits was a 2,000-hp. standard-gage turbine locomotive, with water condenser, exhibited by the Krupp interests. To provide for operation backward, an auxiliary turbine, revolving in the opposite direction to the main turbine, was used. The turbines were geared to the driving wheels. A number of locomotives with Diesel engines were also shown. One of these, of the 1-E type with electric drive and a drawbar pull of 55,000 lb., is for use in Russia.

Progress in Anti-Friction Bearings*

Excellent Results Are Quoted on Reduction of Armature Trouble, Increased Interval Between Lubrications and 10 to 22 per Cent Power Saving

By KARL PFORTE
Manager Hagen Street Railways, Hagen, Germany

THE reports made from time to time on the use of anti-friction bearings by electric railways indicate their increasing use as well as continuous improvement by the manufacturers. These reports all tend to indicate that roller bearings are more adaptable to street railway conditions than ball bearings. Some users of ball bearings, for example, reported that breakage compelled them to return to ordinary bearings.

The questionnaire upon which the deductions in this report are based was answered in the spring of 1923, inasmuch as the report was intended for the convention of September, 1923. As the latter was postponed to September, 1924, it will be understood that the data are more than a year old and that the actual use of anti-friction bearings is more extensive than the report discloses.

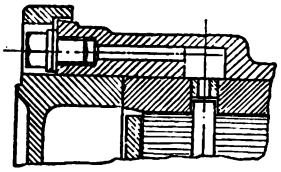
Thirty-seven operators with 20,931 motors reported that 1,107 or 5.3 per cent were equipped with roller bearings, 534 motors or 2.6 per cent with ball bearings and 28 motors or 0.14 per cent with one roller (pinion end) and one ball bearing (commutator end) each. In short, 8 per cent of the motors were equipped with anti-friction bearings. Only two motors had motor axle bearings. These are of the Jaeger roller type and have been in use on the Hagen Street Railway for two years. In October, 1923, the same maker also equipped two motors for the Zürich Street Railways. The makers of the different bearings and quantity delivered follow:

	Roller Bearings	Ball Bearings
G. & J. Jaeger, Elberfeld	746	....
Norma Company, Stuttgart-Cannstadt	225	2
S. K. F. Norma, Berlin	98	186
Fichtel & Sachs, Schweinfurt	22	104
Fries & Höpflinger, Schweinfurt	14	...
Allgemeine Elektricitäts Gesellschaft, Berlin	4	4
Wälzlager-und Maschinenfabrik, Stuttgart	2	...
Kugellagerwerke J. Schmid-Roost, Oerlikon	....	160
Swiss	...	14
Deutsche Waffen-und Munitionsfabrik, Berlin	....	8
Karl Klass, Nürtingen	....	6
Unknown	24	50
Totals	1135	534

Among the users are Berlin, 390 motors; Hamburg Elevated, 154; Hagen, 134, and Cologne, 154. Most of the existing installations are of the arbitrary dimensions developed by individual makers, but since the July, 1923, Zürich international conference on standardization the possibility is offered of achieving a certain degree of interchangeability.

The roller bearings are almost always lubricated with grease exclusively, but ball bearings frequently receive oil. The period between grease lubrications averages four months, but between oil lubrications only one month on the average mileage of 4,150 km. (2,580 miles) a month. Some operators report a performance of 45,000 km. (27,900 miles) between lubrication.

Plain bearings averaged per motor per annum a lubricant consumption of 43 kg. (94.6 lb.) compared with 5.8 kg. (12.76 lb.) for anti-friction bearings. The roller bearings averaged 5.7 kg. (12.54 lb.) and the ball bearings, 6 kg. (13.2 lb.) These results mean an appreciable saving in both lubricants and labor.



Method Used in Hagen for Lubricating Roller Bearings Through Screw-Sealed Housing

LIFE OF PLAIN AND ANTI-FRICTION BEARINGS

An inquiry into the rate of wear of ordinary bearings showed that the average waste of metal per motor per annum on 35 properties was 8.2 kg. (17 lb.). The rate of wear, of course, is dependent upon the proportion of tin, an expensive ingredient. Thus the Hagen system with a tin base of only 40 per cent showed a wear of 3.2 kg. (7.04 lb.) per motor per annum, whereas in Zürich with an 80 per cent base, the wear was only 0.7 kg. (1.54 lb.). It is possible that the high cost of good tin-base bearings has encouraged the purchase of anti-friction bearings, which, at least, have no such high upkeep costs for relining, lubrication and labor.

Replies in regard to the longevity of anti-friction bearings showed the greatest diversity. A general deduction here would be unfair in view of the fact that the answers are a year and a half old. Some individual records do show long life. The Heidelberg Street Railways has had Jaeger roller bearings since April 15, 1911, Elberfeld has had the same make for 10 to 15 years, and the Barmen Mountain Railway has been using them since pre-war days. These records indicate that the higher first cost of anti-friction bearings is equalized in a fraction of their lifetime.

Some of the troubles reported with motor bearings are obviously the result of avoidable weakness in construction where the trouble is not due to insufficient strength for the load. In the case of anti-friction journal bearings, the faults may be due to such outside causes as bad track. Defects appear as failure of packing and breaks or other damage of raceways, balls, rollers and cages. However, the reports show that the later designs are much freer from these troubles.

The replies also indicated the great protection which anti-friction bearings afford against armatures going down on the pole pieces. On motors equipped with plain bearings, it was necessary to rewind 7.5 per cent of the armatures per annum compared with 0.5 per cent on one property and none at all on the others. This is clear proof of the value of anti-friction bearings in reducing crippled cars and so avoiding the loss of revenue mileage.

The Coblentz Street Railway reported that the use of anti-friction bearings had made possible a 10 per cent reduction in the shop personnel. Other railways also reported a saving in labor. Further advantages named were: Easier starting, less strain on motors, less heating and the exact centering of armatures to insure constant air gap and reduction of latter to 2 mm. if desired.

The many advantages of well-built anti-friction bearings should not only lead operators to replace plain bearings in existing motors, but also induce the manufacturers to use such bearings as standard.

ANTI-FRICTION BEARINGS FOR JOURNALS

Of 32 properties operating 9,004 motor cars, 34 have roller bearings and 224 have ball bearings. Of 7,527 trailers, 110 were equipped with roller bearings and 436 with ball bearings. The total number of anti-friction vehicles was therefore 804 or 4.7 per cent of all cars. It will be noted that the trailers were equipped in the proportion of 7.3 per cent; and the motor cars, 2.9 per cent. The bearings were furnished by the makers.

CARS EQUIPPED WITH ANTI-FRICTION JOURNAL BEARINGS

---

*Abstract of a paper before the Internationaler Strassenbahn and Kleinbahn Verein, Homburg von der Höhe, September, 1924.

Among the principal users are: Berlin, 222 trailers and 101 motor cars; Zürich, 77 trailers and 87 motor cars; Dresden, 39 trailers and Dortmund, 30 trailers. As with motor bearings, it is expected that standardization will limit the number of types and permit interchangeability.

The lubrication averages show seven-month periods for grease against two-month periods for oil. The average performance per car is given as 3,700 km. (2,294 miles) per month. On the Hagen system, lubricant is delivered to the journal without removing a lid. This is accomplished by forcing the grease through an upper housing ordinarily sealed with a screw. The grease passes through a channel, as shown in the accompanying drawing, whence it bears directly on the two sets of rollers.

The average annual requirement of lubricant for a plain journal is given as 8 kg. (17.6 lb.) as against only 1.5 kg. (3.3 lb.) for an anti-friction bearing. Therefore, a car with anti-friction journals will give five times the mileage between lubrications obtainable with plain bearings.

As regards wear of plain bearings, the replies show almost no use of tin, as might be expected. On the other hand, long life is being obtained from bronze shells. The anti-friction journals are already showing instances of 10 years life or more, both in the ball-bearing and roller designs. Many of the defects are due either to pioneer designs or to some entirely outside cause like track.

10 TO 20 PER CENT ENERGY SAVING

Although few operators have made tests of relative energy consumption, one would not be far wrong in crediting anti-friction journals with a saving of at least 10 per cent. The Malmö Street Railway made the following interesting tests along this line:

A route 3.3 km. (2.04 miles) with very few curves was selected for tests at constant voltage of the power requirements for trailers fitted with plain and S.K.F. ball bearings respectively. The ball-bearing trailer weighed 6,750 kg. (14,650 lb.) and the plain-bearing trailer, 5,810 kg. (12,782 lb.). The test comprised non-stop operation, but no account was taken of the energy used for turning at the ends.

The ball-bearing trailer required an average of 21.5 kw. per ton-kilometer compared with 27.5 kw. per ton-kilometer for the plain-bearing trailer, a saving of 22 per cent with ball bearings new. As the number of stops and curves increases, the saving would become relatively less, say 15 per cent.

Tests were also made for a month with motor cars over routes with few curves, easy grades and long intervals between stops. In this case, the saving was approximately 10 per cent.

One management reported that although anti-friction bearings ran easier than plain bearings on tangents, it appeared that they ran less easily on curves. Dortmund and Göteborg asserted that the anti-friction bearings required more power than plain bearings, but this would not occur with properly designed bearings. The fundamental thing is to purchase bearings of high quality if the advantages of anti-friction bearings named are to be realized. On the writer's property, Hagen, 15 motor cars now on order will have Jaeger roller bearings on the armatures, motor axles and journals.

Annual Mileage Output per Platform Man*

Comparative Figures for Car Speeds, Hours of Labor and Extra Allowances Such as Days Off, Sick Leave and Vacations Are Given and Their Effects on Efficiency of the Individual Are Discussed

By K. NORREGAARD
Manager Copenhagen Street Railways, Copenhagen, Denmark

PLATFORM wages are one of the dominant factors in the cost of operation. There are two ways to attain a saving in this great item—the first is to pay lower wages; the second, to increase the output per man. The latter method is the subject of this paper.

To probe the subject to the very bottom, we ought to be able to determine how many passengers are served per man per annum, but this would require detail study of fares, car-kilometers operated, ratio of seats offered to seats used, density of traffic per kilometer, speed, working conditions, etc. As the data for such an investigation are not at hand, the present study will be confined to a few of the more important factors outside the question of density and earnings per kilometer.

The mileage per man per annum will depend chiefly on these considerations: (1) Average schedule speed; (2) number of men per car; (3) number of workdays per annum; (4) average number of hours per diem; (5) relation of platform to non-platform time.

HIGHER SPEEDS MEAN HIGHER EARNINGS

The factor of speed is of great importance, not only in the direct relationship between wages and speed but also on account of the greater earning power of faster cars. The increasing competition of the automobile is an added spur.

Speed is affected by the state of the track, by density of street traffic, by trailer and one-man car operation, by the passenger interchange facilities on the car, by the degree of crowding, by the distance between stops, by the location of convenient or safe boarding platforms, by the discipline of the public in boarding and leaving cars, by the character of the control and braking equipment, etc. As to speed, the replies from 65 railways summarize as follows:

Number of Railways	Km. per Hour	Miles per Hour
3	11.0—11.5	6.82—7.13
2	11.5—12.0	7.13--7.44
11	12.0—12.5	7.44—7.75
12	12.5—13.0	7.75—8.06
6	13.0—13.5	8.06—8.37
4	13.5—14.0	8.37—8.68
7	14.0—14.5	8.68—8.99
3	14.5—15.0	8.99—9.30
17	over 15	over 9.30

The lowest schedule speed reported was 11 km. (6.82 miles) an hour; the highest, 30 km. (18.6 miles) an hour. The average speed for all roads was 14.8 km. (9.18 miles) an hour. If, however, we omit the 17 roads whose schedule speed exceeded 15 km. (9.3 miles) an hour, the average declines to 13 km. (8.06 miles) an hour. The great spread in speeds is due to the fact that the statistics include cross-country lines with more or less of their track on private right-of-way, hence the higher figures must be regarded with caution.

PLATFORM ATTENDANCE—NUMBER OF WORKING DAYS

The success of many a railway will depend upon its ability to use such economies as trailers and one-man cars. In the present study, however, we are interested only in the actual miles per man regardless of the number of men per car or train.

The platform man has a number of idle days in the year due to days off, sick leave and vacation. Minor additions are due to instruction periods, misses, etc. The interval between scheduled days off varies from 4 to 16 days, but the average of 67 roads is found to be 52 days a year or every seventh day.

Sick-leave practice is also diverse. A few railways grant full pay for sick leave up to two years, while others do so only for a few days. Some begin with full pay and cut later to 60-80 per cent thereof, and still others show a range of 6 days to 1 year's payment at 10 to 90 per cent of full pay. In general, however, an employee of 3 months' to 1 year's standing will average two-thirds pay for 6 weeks, three-quarters pay for 13 weeks if he has served 1 to 3 years and four-fifths pay for 26 weeks if he has served 3 years or more. A few roads do not pay for sick leave at all.

In reply to the query as to how many days a year are lost because of sick leave, the answers were as follows:

Number of Railways	Average Days per Man
3	4 to 6
15	7 to 9
14	10 to 12
10	13 to 15
2	16 to 18
6	19 to 21
1	22 days
1	28 days
18	gave no data

The number of days lost through sick leave on half of the properties ranged from 10 to 15 days, and the average throughout was 12 days. These figures are not absolutely accurate, as it is possible that some managements included as "sick leave" periods that would have been "scheduled days off" had the employee been well.

---

*Abstract of a paper before the Internationaler Strassenbahn und Kleinbahn Verein, Homburg von der Höhe, September, 1924.

Vacations also show a great range of practice. German street railways tend to base vacations on length of service, the vacation periods consequently ranging from 4 days to 4 weeks. Other railways make the employee's age the chief factor. The Scandinavian and Dutch roads tend to the practice of a fixed period like one or two weeks. A few roads grant no vacation allowance.

The average vacation period on 26 roads is found to be 15 days, the range being from 10 to 18 days. In these figures, also, there is the possibility that some roads have figured into the vacation period the "scheduled days off," but this is not of consequence so long as the managements do not confuse the unpaid "scheduled days off" with the paid "sick-leave" and "vacation" periods.

On assembling the three chief causes of idle time, we find something like this—52 scheduled days off, 12 sick-leave days with pay and 15 vacation days with pay, 4 days for schooling, misses, etc. The total is 82 days, leaving but 283 effective working days out of 365, per man.

AVERAGE APPARENT AND EFFECTIVE WORKING DAY

Of the 68 roads which furnished data, 53 or 77.9 per cent have an 8-hour day. Five roads (7.4 per cent) have a shorter day and 10 roads (14.7 per cent) a longer day. Four of the five roads referred to have an average only a few minutes under 8 hours, but one has a workday of but 7 hours 26 minutes. Likewise part of the 10 longer-time roads exceed 8 hours by only 10 or 15 minutes. In the instances of a 9-hour day, there is compensation through getting every fourth day off, while the property which attains the maximum of 9 hours 47 minutes does so because it has a 2-hour meal relief as part of the workday.

Of course, not all of the so-called working time is effective platform time. First, there are layovers at the terminals, some of which are demanded by the schedule layout and others which are granted for relief. These latter allowances were made long before the 8-hour day, but when the latter was introduced the managements did not or could not take advantage of this change to cut down non-schedule layovers.

As 22 roads did not answer the question on layovers at all, it is possible that they do not grant any. However, the 45 which did show an average layover period of 45 minutes a day.

Meal relief usually ranges from 20 to 25 minutes and counts as part of the workday.

Signing on and off, preparation of reports and the like, on 49 properties are counted as part of the workday; on 19 they are not. The average time on the 49 which pay is 14 minutes a day.

Deadheading time to and from the reporting point usually amounts to but a few minutes and appears to be paid for only on five properties. In one case the men are paid for the time required to draw their pay.

The average effective working time of 63 roads is found to be 439 minutes, or 7 hours 19 minutes.

On comparing the schedule speeds and the effective working time of the platform men, it is found that the average performance per man per annum is 26,860 km. (16,653 miles). This figure requires modification because some operators included as platform personnel men who were assigned to other transportation duties. As these non-platform men amounted to about 3.5 per cent of the total, the actual performance is 3.5 per cent better, or 27,800 km. (17,236 miles).

As previously noted, many of these railways are of cross-country or interurban character. If, then, the properties showing more than 30,000 km. (18,600 miles) per annum per man are omitted, this leaves the street railways which appear to average 21,880 km. (13,566 miles). After certain other deductions, an average of 21,000 km. (13,020 miles) is obtained.

With 283 effective working days averaging 7 hours 19 minutes, an annual total of 2,070 hours is arrived at. If the service was devoted entirely to car movement at 14.8 km. (9.18 miles) an hour, the average of all classes of roads would be 30,600 km. (18,972 miles), but actually it is only 27,800 km. (17,236 miles), a difference of 9 per cent. Part of this difference is due to layover time required by the schedule and part through payments made to men on the extra list.

Current-Checking Means for Cars, Carhouses and Shops*

Methods of Economizing Current Analyzed from Replies of 86 Railways—Personal Supervision Without Mechanical Devices Favored in Berlin and Hamburg—Roads Using Instruments Obtain Savings

By WILHELM PFORR
Manager Berlin Street Railways,
Berlin, Germany

ALMOST all electric railways may be said to use more current than necessary, and the current so wasted is generally used destructively. Wastage is least on routes with long free runs, long intervals between stops and appreciable grades. Wastage is most on routes with short intervals between stops and with close headways and interference from foreign vehicles. Power saving on the latter type of railway, which includes all large cities, is an absolute necessity.

Eighty-six managements replied to a questionnaire in which they were asked to explain their ways of economizing current. Of these, 17 make no effort to save power, 26 use current-checking devices and 43 depend upon power inspectors.

Most of the railways which make no attempt to regulate current consumption belong to the free-running group already mentioned, and it is not believed that it would pay them to inaugurate such regulation. This leaves 80 per cent as the proportion of railways which carry on some form of supervision, with 50 per cent using power inspectors and 30 per cent using instruments. Of the latter class, 10 undertakings use power-on clocks, 10 use watt-hour meters, 4 use ampere-hour meters and 2 use the Wolff acceleration meter.

All users of the first three devices report a saving in energy. The Wolff acceleration meter has not been in use long enough to yield sufficient experience, but it is believed that its chief value is in protecting the electrical equipment against overload rather than in the direct saving of current. Undoubtedly, there is a saving from the use of the various devices, chiefly because the motormen believe that they are under surveillance, yet the use of such devices is not recommended by the writer, at least on large city systems, for the following reasons: (1) The appreciable expense of record-keeping personnel; (2) the maintenance cost of the instruments; (3) overloads occur oftener because the instruments tend to encourage high rates of acceleration and to discourage the series running which is so valuable in congested areas; (4) false comparisons, which are drawn frequently, cause dissatisfaction among the motormen.

For these reasons, personal supervision is preferred to the use of instruments—a practice successful today both at Berlin and Hamburg. There is no extra cost because the same men who serve as motormen-instructors, to the number of one or two per 100 motormen, are used as power inspectors. The success of the method depends largely upon selecting truly skillful men. Aside from this, the motormen should receive power-saving rewards which will be sufficiently high to interest them. It is essential that the bogey of energy consumption for each route and type of car operated should be carefully determined.

It is also desirable to tally the use of current in the carhouses and shops, since this may run from 5 to 10 per cent of the total energy. Watt-hour meters are recommended for all such situations and also for service cars. A separate meter should be used for the circuits employed in car shifting, in lighting and in shop tool operation. The results, as at Berlin, have been excellent, in stimulating competition between different stations in respect to saving power. The meters are read monthly and compared with the month immediately preceding and with the same month a year before. Supervision of traction current consumption on the basis of units per car-kilometer run is conducted on a day-to-day plan, so that the effect of loading, weather conditions, etc., may be figured and appropriate steps taken to correct apparent waste.

---

*Abstract of a paper before the Internationaler Strassenbahn und Kleinbahn Verein, Homburg von der Höhe, September, 1924.

Utility Commissioners' Convention in Phoenix, Ariz., Nov. 11

PERILS of railroad grade crossings, the proper method of regulating motor vehicle transportation, rates and service of railroads and public utilities, valuation of railroads, uniform laws for regulating commissions and proposed amendments to the federal transportation act of 1920, are among the subjects scheduled for discussion at the thirty-sixth annual convention of the National Association of Railroad and Utilities Commissioners, which will meet in Phoenix, Ariz., beginning Nov. 11 and will last four days.

As one feature it is expected that an address will be delivered by Secretary of Commerce Hoover. There will also be addresses by at least one member of the Interstate Commerce Commission and several state commissioners; by former presidents of the association, including Carl D. Jackson of New York City; Walter A. Shaw of Chicago and Charles E. Elmquist of St. Paul. There will also be addresses by representatives of the railroads, gas, electric light and power and telephone companies.

Pennsylvania Association Annual Meeting

THE annual meeting of the Pennsylvania Street Railway Association will be held at the Penn-Harris Hotel, Harrisburg, Dec. 5.

An effort is being made to have a symposium on traffic problems led by Harland Bartholomew of St. Louis and attended by directors of public safety and chiefs of police from the various cities in Pennsylvania. Other topics to be considered are bus operation and the economy of buying equipment repair parts direct from the manufacturer or making them in the railway shops.

At the evening dinner addresses will be made by prominent men in and out of the industry.

Central Traffic Association Meeting

THE next regular meeting of the Central Electric Traffic Association will be held at the Waldorf Hotel, Toledo, Ohio, Nov 19 and 20.

The morning session on Nov. 19, beginning at 9 o'clock, Eastern time, will be in the nature of a round-table discussion, at which time matters of general association interest and particularly items to be dealt with by committees will be considered.

The afternoon session and the session on Nov. 20, will be devoted to reports of committees and other business.

Iowa Midyear Meeting at Des Moines, Nov. 13-14

ANNOUNCEMENT is made that the midyear operating meeting of the Iowa Electric Railway Association will be held at Des Moines, Nov. 13 and 14. The following program has been arranged:

Thursday morning session:

Paper, "Track Construction and Maintenance," by N. W. Freund, Davenport.

Paper, "The automatic Substation—Its Care and Maintenance," by D. H. Nail, Des Moines.

Paper, "Bus Maintenance," by W. G. Lamb, Waterloo.

Following the morning session, a luncheon will be given through the courtesy of the Des Moines City Railway. In the afternoon there will be inspection trips over the properties of the Des Moines City Railway and Des Moines & Central Iowa Railroad. A banquet will be given in the evening at the Fort Des Moines Hotel.

Friday morning session:

Paper, subject to be selected by a manufacturer's representative.

Paper, "Maintenance of Equipment," by T. E. Wood, Omaha, Neb.

Paper, "Lubrication of Railway Motors," by C. Bethel, Westinghouse Electric & Manufacturing Company.

General discussion and election of convention committee.

American Association News

Committee of One Hundred

THE executive committee of the Committee of One Hundred held a meeting at the Railroad Club Oct. 28. Those present were Gen. Guy E. Tripp, chairman; H. R. Hayes, secretary and treasurer; J. N. Shannahan, S. M. Curwen, P. H. Gadsden, T. N. McCarter, Randal Morgan, F. H. Sisson, L. S. Storrs, H. L. Stuart, F. R. Coates, E. C. Faber for Barron Collier, Morris Buck for J. H. McGraw, J. W. Welsh and Labert St. Clair.

The work of the committee since its inception in 1917 was reviewed and a report of the finances was given. A general discussion ensued as to the best means of furthering publicity and dissemination of facts and statistics for electric railways, which has been done by the advertising section of the American Association in connection with the Committee of One Hundred. A general appreciation of the work being done by Mr. St. Clair as director of the advertising section was expressed.

Comment on Foreign Report at Executive Committee Meeting

AT THE meeting of the executive committee of the American Association held at Atlantic City, on Oct. 6, a vote of thanks was passed for the work of the committee on foreign operation, consisting of J. W. Welsh, chairman; H. A. Johnson and Harry L. Brown. This was mentioned briefly in the issue of this paper for Oct. 11, page 603. In introducing the motion, J. H. Hanna, vice-president the Capital Traction Company, Washington, D. C., addressed President Budd as follows:

"Before we adjourn I would like on my own personal account to say a word of appreciation for the work of this foreign committee. I want particularly to say it now because the idea originated in your mind and you and Mr. McGraw are really responsible for it.

"I believe that the investigation and the report as rendered is about as useful a thing along the same lines you have been talking as anything I have ever seen. This bus problem is being thrown up to us all the time—the question of the bus superseding the trolley car. The great argument that these people bring forth is the fact that the bus handles the city transportation in London and other cities. I think that most of us generally have known the answer to that, but we have not had the facts. This report gives us the facts and in as clear and concise a manner as it could do. I don't know of anything that has been of more value to us in meeting that particular problem when it is brought up.

"If it is in order I would like to move a vote of thanks to that committee for the splendid work it has done."

The motion was seconded and carried.

Metropolitan Section Meeting Scheduled for Nov. 7

A MEETING of the Metropolitan Section of the American Electric Railway Association will be held at the Engineering Societies' Building, 33 West 39th Street, New York City, Friday, Nov. 7, at 8 p.m. The outstanding event on the program will be a talk by E. F. Wickwire, chairman of the committee on co-operation with manufacturers, his subject being "Friendlyizing the Public." Music will be furnished by the Interborough quartet and a moving picture called "The Straphangers," loaned for the occasion by the Transit Commission, will be shown. In addition to the other business of the meeting, section membership pins will be distributed.

Motor Bus Information Desired by Accountants' Committee

THE committee appointed by the American Electric Railway Accountants' Association at the recent convention at Atlantic City to draft a classification for motor bus operations is desirous of obtaining information of current practice among operating companies.

The request has been made by M. W. Glover, General Auditor West Penn Railways, Pittsburgh, Pa., chairman of the committee on bus accounting, that all companies operating motor buses forward to him a copy of the classification now in use covering motor bus operation, in order that the committee may have full information regarding all classifications now in use. Information regarding statistics which are used in connection with motor bus operations will also be appreciated.

Maintenance of Equipment

Convenient Buggy for Long Bars

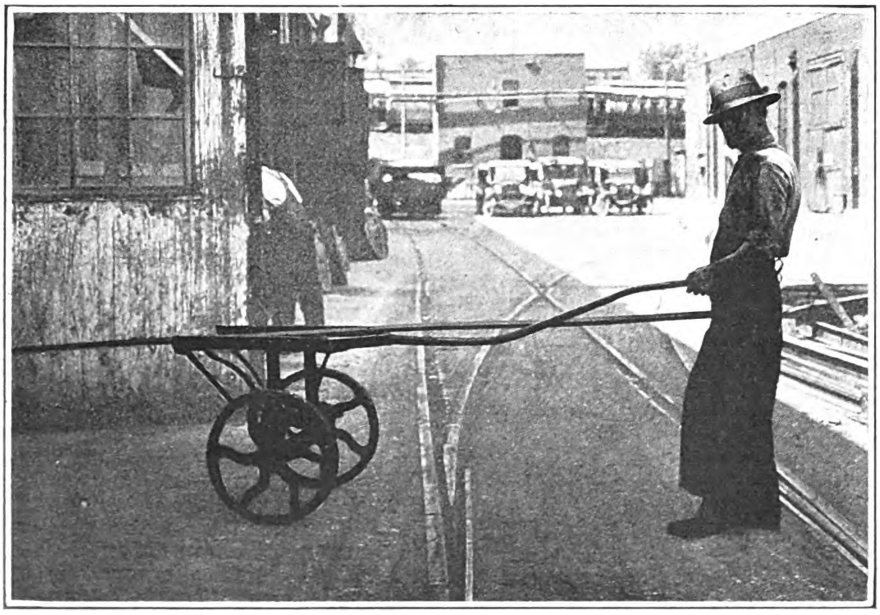
By J. L. Rogers

Forge Shop Foreman Kansas City Railways

FREQUENTLY it is necessary to handle long bars of steel or wrought iron from stock to the forge shop, or from furnaces to hammers within the shop. Such bars are usually too heavy to be lifted by hand without excessive labor and fatigue. For handling this class of material, the simple two-wheeled buggy shown in the illustration below has proved an efficient time and labor-saving device, even though the Kansas City Railways shop is well equipped with hoists and cranes.

As shown in the illustration, the frame is made up of steel angles, riveted together. The top is made up with a number of cross-pieces that help to reinforce the framework and form a support for carrying the material. The carriage is mounted on two cast-iron wheels large enough that it may be readily moved over tracks or similar obstructions. The two top side angles are brought together and welded to the long handle. This enables the workman to manipulate the buggy with one hand while steadying the piece being transported with the other.

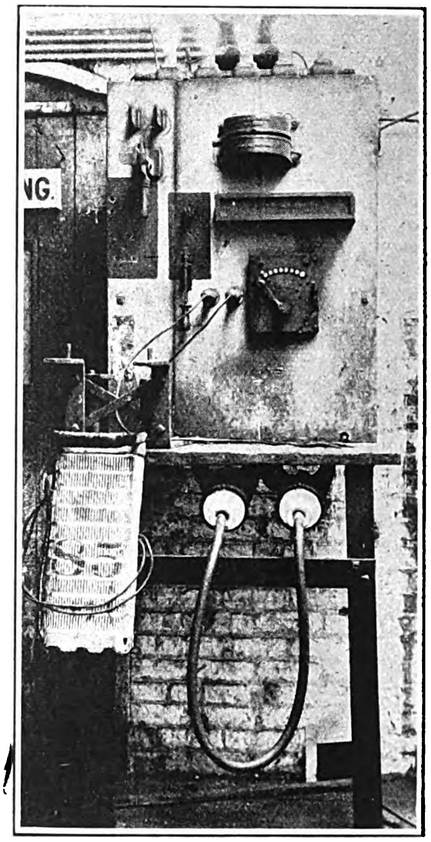
This buggy was designed of such a height that material can be pulled from the furnaces directly onto it, or can be pushed from the buggy to the bed of a steam or air hammer without lifting.



This Two-Wheeled Buggy Has Been Found Useful for Handling Long Bar Material About the Forge Shop of the Kansas City Railways

Testing Control Jumpers

TRAIN control jumpers are tested in the Wheaton Shops of the Chicago, Aurora & Elgin Railroad by passing a current of approximately 1½ amp. through each strand and noting the continuity of the circuit by means of a small indicator lamp mounted in an annunciator box. The jumper to be tested is placed in receptacles mounted under the bench of the testing board. A 600-volt series circuit is passed through each of the conductors in turn by means of a selector switch. This was originally a motor starting switch with handle and contact points, but has been wired up for this special use. In series with each of the small conductors is a small indicator lamp located in an annunciator box and a five-lamp bank which furnishes the load to the 600-volt d.c. circuit. By moving the handle from one point to another, the various conductors in the jumper cable may be tested. Moving the jumper around while it is attached will disclose any breaks in the cable, as the small annunciator light and the lamp bank will flicker.



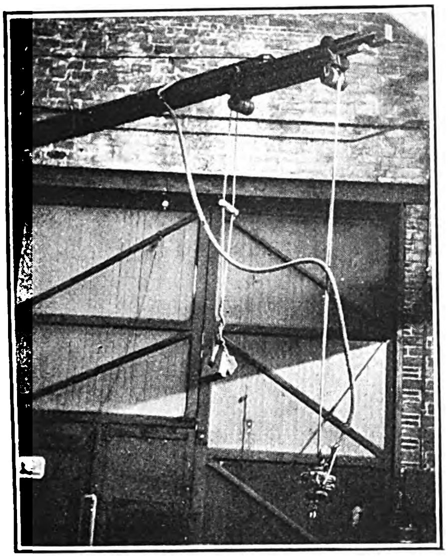
Control Line Jumpers Are Tested by Means of High-Voltage Series Circuit with Lamp Bank Acting as Load and Indicator Lamp in Series

Mounted on the same test board is a bracket for holding motorman's portable heaters, which are tested by means of the same lamp bank and series circuit.

Increasing Usefulness of Air Drill

IN THE mill room of the Illinois Traction System shop at Decatur use is made of an overhead suspended air drill for drilling heavy timbers such as sills and bumpers. To facilitate the handling of the drill and air hose, they have been suspended from a carriage which travels on a swinging telfer arm. The carriage is approximately 3 ft. long and has a pulley suspended under each end. Over these pulleys two ropes are carried, at the ends of which is the air drill and at the other the counter-balancing weight.

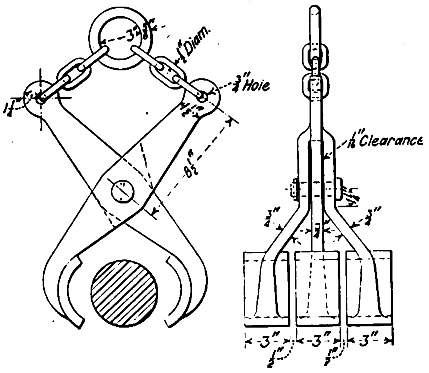
The carriage has four wheels similar to those used in hanging sliding doors. A rail on each side of the telfer arm supports the wheels and carriage. This device has greatly increased the accessibility of the drill. The arm is 12 ft. long, thus making the drill available over the area of a half circle of that radius.



Suspending Air Drill from Traveling Carriage on Swinging Telfer Arm Increases Its Radius of Activity

Convenient Tongs for Lifting Wheels

A CONVENIENT form of tongs or shackles for lifting wheels when mounted with axles is in use in the new Hillcrest shops of the Toronto Transportation Commission, Toronto, Canada. The tongs, which resemble somewhat a pair of ice tongs, are of forged steel, with lips shaped to fit a 4½-in. diameter axle.



Lifting Shackle for Pair of Wheels and Axle

One jaw has two lips, while the other has a single one, so that the balance is the same. A short section of chain on each side connects with a 3-in. ring, so that when placed on an axle and with the crane hook in the ring, the shackle will grasp the axle automatically with no danger of its dropping while being transported by the crane. This design was worked out under the supervision of W. R. McRae, superintendent of rolling stock.

Record Card for Power Equipment

A COMPLETE record of all power equipment is kept by the International Railway, Buffalo, N. Y., on 5-in. x 8-in. cards. A special form was devised for the purpose which is both an index card for files of photographs, bulletins, blueprints, inventory records, etc., as well as an operating record card. Under the various subheads the file number of any data pertaining to the particular piece of equipment is entered.

The card is designed so that one form can be used for various types of equipment, any subhead not applying to it being crossed off. Under remarks, dates when oil was changed or filtered, commutators or rings turned, failures of any kind, painting, etc., are entered. This is continued to the reverse side of card.

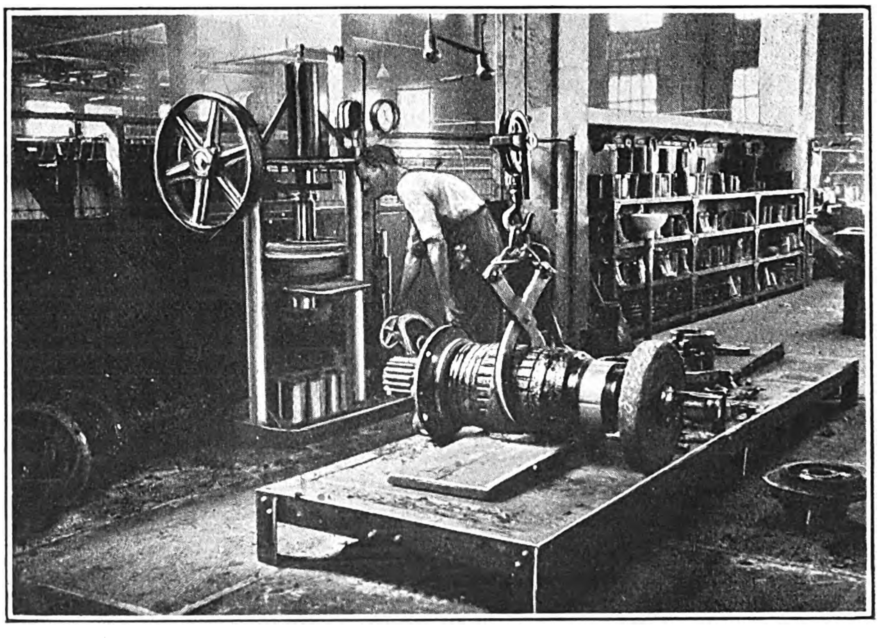
A Convenient Arrangement for Changing Bearings

ONE section of the armature room in the Snelling Avenue shops of the Twin City Rapid Transit Company is set aside and is conveniently arranged for making armature bearing changes.

At one side of this section of the shop is located the bearing press, which is a McCall Machine Works 15-ton hydraulic unit. This machine is comparatively small in size and is set up at one side of the bearing section, where it occupies the minimum amount of room and at the same time is very conveniently located relative



Overhead Hoist, Work Bench, Hydraulic Press and Storage Bins Are Conveniently Arranged for Making Bearing Changes

to the work bench and the storage bins. These storage bins allow bearings to be sorted and kept off the floor with a minimum amount of moving around on the part of the workmen. A low, substantial bench raises the armatures to a convenient height.

An electric overhead hoist is arranged so that it serves this entire section of the shop and facilitates the work of handling the armatures from storage racks to the work bench, etc. The general arrangement of the equipment for making bearing changes is shown in the accompanying illustration.

New Equipment Available

Stainless Steel for Third Rail Terminal Bolts

With the phosphor bronze and mild steel bolts used by electric railways for connecting terminals to third rails, some difficulities in removal have been found. In case of accident, when it is necessary to unscrew the bolt the threads are sometimes found fixed in the rail due to corrosion, so that considerable trouble and delay take place in removing them. With a view to overcoming this trouble, bolts made from stainless steel have been furnished to the electric railways in London by Thomas Firth & Sons, Ltd., Sheffield, England.

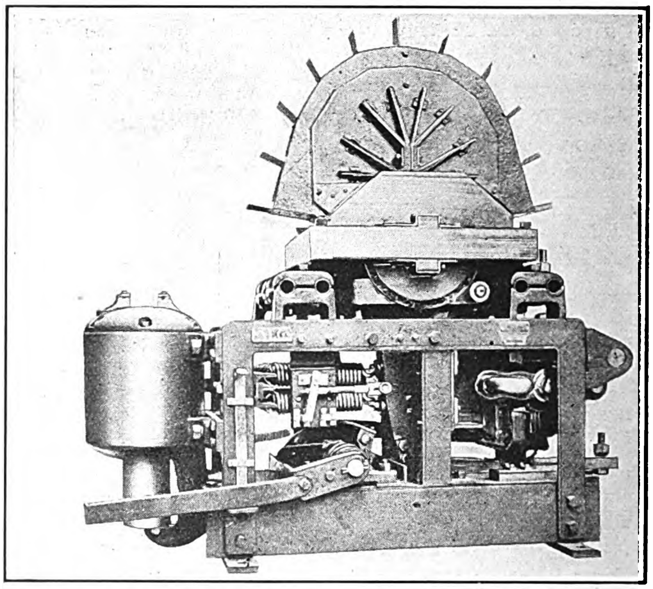
The bolts are used to secure the plate carrying the cable, which conveys the current from one length of the third rail to the next. Two bolts go to each plate, and the current cable is joined to these plates by means of a gunmetal holder. The bolt is threaded through the rail, and the nut is screwed up on the outer side. Threading is used in order to have a firm contact between the rail and the bolt, since the bolt is really a conductor of current. Where gun metal or mild steel bolts are used for this service it has been found that in removing the bolts, the heads are usually twisted off, which necessitates having to tap out the remaining portion.

In the sample stainless steel bolts put in service in London approximately two years ago, satisfactory results have been obtained. Although these are coated on the outside with accumulations of rust from the rail and soot from the atmosphere, this is readily cleaned off with a wire brush, and when unscrewed the bolt threads show bright surfaces.

Welding Electrode for Cast Iron

A welding electrode which is recommended particularly for welding cast and galvanized iron has been brought out by the General Electric Company, Schenectady, N. Y. It consists of a central metallic core surrounded by a layer of flux outside of which is a metallic sheath. The flux is thus protected from dissipation, and improved welding results. Since there is no loss of flux in transit and during welding, the correct amount is furnished the arc. On account of its stability, the arc is easy to "strike" and to "hold." Heat is concentrated at the point where it is needed and so hastens the rate of melting. The electrode can be used with alternating or direct current.

German High-Speed Circuit Breaker



A.E.G. High-Speed Circuit Breaker for Javanese State Railways

A new high-speed circuit breaker, which in one-sixtieth of a second will extinguish an arc rising to 9,000 amp. on 1,500-volt railway circuits, has just been manufactured by the Allgemeine Elektricitäts Gesellschaft in Berlin for the State Railways of Java. The breaker contains no specially radical features but is a development and refinement of the regular A.E.G. high-speed breaker. The accompanying illustration shows the particular breaker in question. Two oscilligrams show short-circuit tests made on this breaker.

The breaker operates to open the main circuit, but it is shunted by a resistance which, with the normal 1,500-volt circuit, will draw 640 amp. A second breaker operation then opens the circuit in another place. The breaker is a part of an order for the Javanese State Railways being furnished by the Allgemeine Elektricitäts Gesellschaft.

The News of the Industry

Traffic Plan Suggested

Engineers Recommend More Street Space and the Elimination of Parking

During the past eight years ownership and use of motor vehicles in Detroit, Mich., and vicinity has increased twelve times faster than the population. This is one of the conclusions contained in a report of the survey of downtown traffic made by Daniel L. Turner and John P. Hallihan, engineers of the Rapid Transit Commission, of which Sidney D. Waldon is chairman. The report was recently submitted by the commission to acting Mayor John C. Lodge.

Their conclusion shows that at the present time 93 per cent of the total vehicular traffic passing in and out of the business district during the 12 hours consists of motor cars; only about 7 per cent are street cars, horse-drawn vehicles and other miscellaneous types. This motor car traffic is 7½ times what it was 8 years ago.

They concluded that at all times during the day there are approximately 10,000 to 12,000 vehicles moving through the business district. The experts believe that by-pass traffic routes should be developed around the business district in order to relieve the district of the large amount of through traffic now traversing it to no useful business purpose. It was their finding that during rush hours individual automobiles carrying only 25 per cent of all passengers homeward bound utilize, roughly, 91 per cent of the traffic capacity of the streets available for passenger transportation, thereby congesting the streets and delaying 75 per cent of the passengers using the street cars and buses. They claim that the conditions attending safe movement in a congested city street do not permit attaining more than about 50 per cent of the theoretical capacity and that the traffic arteries through the business district of Detroit are rapidly approaching the saturation point. To meet these rapidly increasing traffic requirements they recommend additional street space up to the practical economic limit in order that both individual and collective traffic may be adequately accommodated and that until such relief can be attained, and afterwards to the extent that it can be furnished, collective traffic facilities should be improved, and should be given preference over individual passenger traffic during the rush.

On the subject of parking, the rapid transit engineers agreed that parking should be prohibited on street car streets and motor bus routes and other vehicles on other thoroughfares during rush hour. Parking should also be prohibited along street car and motor bus routes by segregating commercial traffic from passenger traffic during rush hours and providing special routes for such traffic and finally along street car, bus and individual motor car routes, by requiring all crossing traffic to cross at designated cross streets a number of blocks apart instead of at every crossing street, thereby reducing cross interferences, increasing the safe speed and consequently accelerating the traffic movement for both individual and collective traffic.

Bus Issues in New York Deferred

At the regular meeting of the Board of Estimate, New York City, held on Oct. 31 the matter of the bus franchises was put over until the next meeting of the Board. It had already been put over from the meeting Oct. 29, when Mayor Hylan said that he would grant no franchises to the Third Avenue Railway unless it first surrendered its trolley franchises on 42d Street, 125th Street and some other streets. The suggestion of Comptroller Craig that the city could operate buses itself by invoking the home rule law was referred by the board to the committee of the whole and to the Corporation Counsel. Reference was made in the ELECTRIC RAILWAY JOURNAL, issue of Oct. 25 to the bus plan of the New York Railways. At the meeting of the Board of Estimate on Oct. 21 a letter was read from the receiver of the New York Railways to the effect that the company was prepared to accept a bus franchise on terms generally consistent with the report made to the Estimate Board by the Board of Transportation under date of Oct. 14, 1924. The letter stated further that the company was prepared if such borough bus franchise were granted to discuss at once the fair terms for replacement of about 46 miles of existing trolley track in Manhattan with buses.

Seek Injunction Against Bus Line in Kansas City

The receivers for the Kansas City Railways, Kansas City, Mo., have filed a petition for injunction in the federal court against the operators of an inter-city bus line to prevent its operating on the streets of Kansas City. The petition recites ordinances in both Kansas Cities, enacted some years ago to control "jitney" traffic, and which specifically bar jitneys from streets having street car tracks. The receivers, however, do not restrict their appeal to the grounds of these ordinances, outlining many other substantial reasons for prohibition of bus line operation under present conditions, without licenses, without payment of adequate or any remuneration to the cities for use of pavements, without protection to the public, with hazards to the street railways and other property.

Traction Message Discussed

Hearings on Chicago's Transportation Issues Consider Insull, Blair and Busby Plans

Mayor Dever's determination to get a comprehensive transportation plan on the February primary ballots in Chicago became increasingly evident in the first week of the public hearings of the city council committee on local transportation, taking up the Mayor's recent traction message.

At the opening session, held on Oct. 27, and a subsequent one on Oct. 30, Alderman Schwartz, chairman of the committee and the Mayor's spokesman, exhibited a desire to brush aside the Insull subway proposal and learn the temper of the other aldermen on the Busby offer, a letter submitted by Leonard A. Busby, president of the South Side street car lines, proposing in effect to sell those lines to the city separately from the unified Chicago Surface Lines system.

Herein, Alderman Schwartz indicated, Mayor Dever hopes to find a wedge to get at the Surface Lines and force them to his terms by a threat to buy the south side lines, though the Busby terms were identical with those from the Surface Lines as a whole which the Mayor declared to be "impossible." Alderman Kostner, a committee member, the first openly to dispute the Mayor's conclusions, declared it would be impossible ever to buy a segment of the lines and that such a threat would be useless.

Forced by Alderman Kostner to make revelations regarding the secret bankers' purchase conferences of last summer, Alderman Schwartz disclosed for the first time just how close to a sale of Surface Lines and the Mayor came. In fact, only a matter of bookkeeping prevented the consummation of the deal. The city, he said, was willing to pay $162,000,000, the capital account of the surface lines, if the company transferred to the city its depreciation, liability and certain other cumulative funds, amounting to upward of $20,000,000. At the Surface Lines offices it was said that the Mayor's system of bookkeeping transfer would have deprived the surface lines certificate holders of anything from the sale.

The Insull plan, agreeing to build $23,000,000 worth of elevated lines into districts now unserved by rapid transportation if the city uses its $40,000,000 traction fund to build a downtown subway for elevated trains, was declared by Alderman Schwartz to be a "palliative" and no real cure for the situation.

The prospects of financing a half-billion dollar transit plant was taken up. The certificates which the city proposes to trade for the elevated and surface lines stock in the event of purchase were explained from the bankers' viewpoint by Alderman Schwartz. He said that the bankers say they may sell around 94 to start but they will go up.

He said the city would pay $162,000,000 to the surface lines, $90,000,000 to the elevated and spend $217,000,000 in the first of the three construction periods for new lines. The first period of construction calls for the subway.

The Blair unification plan, a merger of elevated, surface and subway transportation into either a private or municipal corporation proposed by Henry A. Blair, president of the surface lines, will be touched upon at hearings to be held after the election.

Seeks Operating Rights on Chicago Streets

A request for franchises from the Chicago Motor Coach Company, which has confined its operation heretofore chiefly to boulevards and parks, has been submitted to the city of Chicago providing for routes on city streets largely serving territory now exclusively held by the Surface Lines. The proposal offers the city the right to purchase nearly all the lines not included in its present boulevard system.

The coach company operates on grants from the park boards which are separate taxing bodies with powers quite different from those possessed by the city. Although disclaiming any right of the city to tax or regulate bus operation, the company recognizes the potentialities of a suit now pending between the two, and suggests that such time and expense be saved.

The coach company arranged terms satisfactory to the park boards to cover the wear on their boulevards, and now proposes to pay the city 2 per cent of its gross annual receipts from the mileage operating on the city streets, less any future taxes or fees imposed by the city on the company.

Streets are divided into lists A and B. The first is said to cover streets needed mostly for terminal turns for the boulevard lines, and a 20-year franchise for these is requested. For list B there are alternative proposals: a 20-year franchise with purchase right on three years' notice in writing, or a 10-year franchise, renewable for five years, with a purchase right on one year notice in writing at any time after the franchises have run six years.

"It is possible for the city, within a reasonable time under this plan, to enter into the business of bus or motor coach transportation as to the streets included in list B without being required to pay anything other than a fair valuation for the equipment in use on the thoroughfares covered," said James J. Condon, counsel for the motor coach company.

When the company recently began sending its buses over city streets the corporation counsel on advice of the Mayor threatened to arrest the drivers for using the city streets without a license. The company instituted suit for an injunction, which is still pending. In its proposal it now specifies that any franchises shall state that neither side surrender any of its contentions but that at the expiration of the grants the status quo be preserved.

Bus Ordinance Proposed

St. Louis Buses Would Pay 12 per Cent of Gross Receipts—Maximum Fare 10 Cents

A proposed ordinance providing for rigid regulation by the city of bus operation in St. Louis, Mo., was presented to the Board of Aldermen by the chairman of the legislative committee. It provides for co-ordination of the buses and street cars and has been attacked by Richard W. Meade, president and general manager of the People's Motorbus Company, now operating extensively in the city, as a sure way of preventing the people from obtaining the sort of service his company offers. The measure was prepared by C. E. Smith, consulting engineer for the city. He and E. R. Kinsey, president of the Board of Public Service, opposed bus permits recently granted to the People's Motorbus Company giving that company the right to operate their buses over 43 miles of additional streets.

Salient features of the new bill are: Payment by bus companies of 12 per cent of their gross receipts annually to the city as the aggregate of an operating tax, licenses and all other city taxes, approval by the Board of Aldermen as well as of the Board of Public Service of bus route permit, strict regulation of service and transfers from all bus lines to street cars and between all bus companies.

The present bus ordinance provides for payment of 3 per cent of the gross receipts to the city and for an annual license fee of $25 per bus.

The transfer plan is subject to approval by the State Public Service Commission. No extra fare for a transfer from a bus to the street cars will be permitted, and the bill provides: "The fare collected for each transfer ride shall be apportioned between the two portions of the ride as may be agreed to by those who furnish the rides, subject to the approval or order of lawful agencies having jurisdiction."

Another provision of the new bill is that the maximum fare of 10 cents shall be reduced if the operating income shall yield more than a reasonable return on the bone fide investment in physical property after all expenses have been paid, and that no allowance shall be made in computing investment for promotion, good will, going value or permits.

An important provision says: "It is the express purpose of the city to grant revocable permits for operation of buses to supplement street railway service, and not to duplicate or compete with such service."

Another portion of the bill declares that no permits shall be granted to a company whose principal place of business is not located in the city of St. Louis and whose property to be used in the business is taxable in some other city. The headquarters of the People's Motorbus Company are located at 585 Adelaide Avenue, University City, Mo.

The proposed ordinance provides, further, that the existing bus companies must comply with its provisions immediately if they wish to preserve the permits granted by the Board of Public Service. No permits shall be for exclusive use of any streets. This feature may become the matter for much litigation as the People's Motorbus Company contends that the permits granted it by the Board of Public Service are exclusive and constitute perpetual franchises.

Investigation Completed—International Rejects Contributions

Representatives of the Interstate Commerce Commission and the New York State Public Service Commission have closed their joint investigation into the cause of the fatal accident on the Buffalo-Niagara Falls high-speed line at Ellicott Creek crossing Oct. 19. Four passengers were killed and upward of 450 others were injured in the rear-end collision between two three-car high-speed line interurban trains. Many are still in hospitals in Buffalo, Tonawanda and North Tonawanda with arms and legs off. Most of the passengers were from Philadelphia. They had through tickets over the Pennsylvania and International railroads.

B. C. Craig and Clyde Waldo conducted the investigation for the Interstate Commerce Commission. Representatives of both commissions refused to indicate what their reports would be, but it was intimated in the newspapers that one of the recommendations will be the installation of an electric automatic block signal system on the Buffalo-Niagara Falls high-speed line. It was stated that the cars operate under very close headway when traffic is heavy and the need for such signal system was said to have been disclosed by the investigators.

Conflicting statements were made by witnesses regarding the action of the motorman who ran the second of the wrecked trains. Several witnesses are reported to have testified that he left his post and rushed back into the first car of the second section with his hands over his head. Other witnesses are reported to have testified the motorman stuck to his post. The motorman is in a Buffalo hospital in a critical condition. The investigation was held behind closed doors and it was not revealed whether or not flagmen from the stalled first section went back to signal the onrushing second section.

President Herbert G. Tulley of the International Railway rejeeted a proposal made by members of the I. R. C. Co-operative Association of employees to contribute one day's pay to the company to aid in the settlement of the damage claims. Several petitions have been circulated among the employees offering to raise a fund for the company and hundreds of employees signed.

The International Railway offered to pay the expenses of friends and relative of injured passengers from Philadelphia to Buffalo and North Tonawanda hospitals in instances where friends and relatives were too poor to pay their own expenses. Many took advantage of this opportunity to come to Buffalo to visit the injured passengers. One of the passengers who died of injuries sustained in the collision was buried in Tonadanda by the International Railway.

Weekly Pass in Oklahoma City

An unlimited number of rides may be taken by passengers on the lines of the Oklahoma Railway, Oklahoma City, who purchase a weekly pass for $1.25. The Oklahoma Corporation Commission has approved an application of the railway for permission to issue these passes as a means of increasing patronage and revenues of the company. The 8-cent fare, or two fares for 15 cents, still remains in force. The company began issuing these passes on Sunday, Oct. 26. They are good for only one passenger a trip, but are transferable. Company officials state that the passes will be more economical than the regular fare if street car patrons ride frequently.

A short trial under the recent increased fare showed that revenues of the company were only slightly increased and that patronage had fallen off as compared with the same period last year. John W. Shartel, president of the company, hopes, through the weekly pass system, to increase the number of riders and at the same time benefit people who desire to use street cars frequently. Reference to the recent fare increase was made in the ELECTRIC RAILWAY JOURNAL, issue of Oct. 11.

Cleveland Wage Question to Go to Higher Court

Members of the street car men's union in Cleveland, Ohio, voted to appeal the decision of the Common Pleas Court, which recently ordered a rearbitration of the union's demand for a wage increase for platform employees of the Cleveland Railway. The vote of the union to carry its case to a higher court was announced as being 1,976 for the appeal and 427 against. The decision of the union to appeal the case to a higher court and not to submit to a rearbitration until the higher court has ruled on the decision of the Common Pleas Court means that the Cleveland Railway will also likely appeal that part of the decision which held that the closed shop agreement between the company and union was binding upon the company. A decision by the company on this question is expected shortly.

The Common Pleas Court nullified the first arbitration, which granted the men an increase of 12 cents an hour, on the ground of fraud. The court held that the supposedly neutral member of the arbitration board which sat last May was biased and prejudiced in favor of the union and against the Cleveland Railway.

Bus Service in Buffalo Scheduled

Bus service in Buffalo is scheduled to start on the Delaware Avenue line Nov. 2, it was announced by R. H. Horton, vice-president of the International Bus Corporation, a subsidiary of the International Railway. The Public Service Commission granted the necessary permit to the new bus company after the City Council had voted four to one to approve the franchises on the Delaware Avenue and East-West Delavan Avenue lines. Initial service is to start with 10 double-deck buses of the Fifth Avenue type between the Terrace and Delaware Park on Delaware Avenue. As soon as additional buses are received, the International Bus Corporation will extend the service to the Buffalo-Kenmore city line, and later service will be started on the Delavan Avenue line between Niagara Street and Bailey Avenue.

A 10-cent fare will be charged on the bus lines with free transfers to connecting trolley lines. Trolley passengers receiving transfers to connecting bus lines will be charged 3 cents extra, the trolley fare being 7 cents or four tokens for 25 cents.

With buses in service on Delaware and Delavan Avenues, the International Bus Corporation will give bus service on three routes in Buffalo. The Bailey Avenue bus line has been in successful operation since last spring. The company will spend $282,000 for new single and double deck buses.

Compromise Proposals Offered in Cincinnati

Settlement of Cincinnati's traction problem appears more likely since alternative compromise proposals respecting street paving and the guarantee clause in the proposed new franchise have been submitted by representatives of the Cincinnati Traction Company and Cincinnati Street Railway Company on one side and the city of Cincinnati, Ohio, on the other. The Mayor's traction committee will meet shortly after the election to be informed of the status of the negotiations for agreement on a new franchise. The city has been insisting that the operating company shall pay one-half the cost of repairs of the streets between the rails and 18 in. to each side. Representatives of the traction and railway companies have felt that it was too heavy a burden to place on the operating company and eventually on the car riders, since fares are the only revenue.

In the matter of the guarantee clause the company representatives have said they would sacrifice, if necessary, one-sixth of the dividend of 6 per cent on the capitalization in the effort to keep for three years initial the fare at 7½ cents or less, provided a rise in fare was not caused by an increase in wages. This was not acceptable to the city representatives. Suggested compromises states that the wages clause in the 7½-cent fare guarantee be eliminated in consideration of a modification to be made in the paving clause. Alternative proposals for a modification of the paving clause include the operating company assuming one-half the cost of repairs on streets improved during or since 1920 and the company being charged with not to exceed $25,000 in any one year for street repair.

A statement has been drawn up setting forth conditions prevailing now and for some time past and what is expected to result if a new franchise is granted; in brief, that lower fares and better service should and would supplant high fares and the present service. There would also be the substitution of one company for several.

Sunday Pass in Pittsburgh

The Pittsburgh Railways, Pittsburgh, Pa., started the sale on Oct. 26 of a Sunday street car pass for a two months trial period which will permit of an unlimited number of rides within the first fare zone, or that area covered ordinarily by a one-token ride from the center of the city. The pass sells for 25 cents and from it any number of rides may be had. The special Sunday transfer now in use covers the same area and will not be withdrawn, but will be available for those who do not make use of the new Sunday pass.

The Sunday pass is an outgrowth of the weekly pass which the Pittsburgh Railways recently installed in Washington and McKeesport. The user on Sunday will have the same privilege for riding as is enjoyed by residents of those two communities during the week. No transfers are issued on the passes and they are not good on night cars or on interurban cars.

Under the slogan "Ride all day Sunday for 25 cents," the Pittsburgh Railways, through its commercial department, advertised its scheme broadly. The transportation department got out a special circular addressed to trainmen explaining to them how the passes would be supplied to the men on Friday of each week and that each man would be charged with ten of these passes bound in a pad. With the proceeds from the sale of these the men were to purchase additional passes, if necessary.

For the first Sunday, Oct. 26, approximately 20,000 of the 25-cent passes were sold. It is said that the 17,500 originally printed for use on that day were exhausted before noon, and 9,500 of the ones that had been printed for the following Sunday were restamped and rushed to the various carhouses to meet the demands of the patrons. William H. Boyce, commercial manager of the railways, said that the sale exceeded the company's expectations; that while the token fare receipts fell off about 40,000 during the day, travel was heavier than on the previous Sunday. According to a check-up, each buyer of a pass used the ticket for about 5 rides.

In its announcement of the installation of the pass the commercial department of the company stated that the success of the pass in the next ten Sundays would determine its adoption for future use. This is another proof of the company's efforts to improve service.

Alleged Fraud in Seattle

Events in connection with the purchase of the Seattle Municipal Railway System, Seattle, Wash., and later probing of that transaction were testified to before the City Council's department efficiency investigating committee on Oct. 21 and Oct. 22. Witnesses went into detail in accusing prominent officials connected with the railway interests and the city of trickery, bribery, conspiracy and double dealing in their efforts to have the $15,000,000 purchase contract of the street railway lines rescinded. The Seattle papers characterized the story as a sordid one and the evidence as sensational.

News Notes

Will Seek Bus Charter.—The Lehigh Valley Transit Company, Allentown, Pa., will apply on Nov. 17 for a charter for the Lehigh Valley Transportation Company, a subsidiary, for permission to operate a bus line in Northampton, Bucks and Montgomery Counties.

Buses Barred.—The Interstate Public Service Company, New Albany, Ind., has won its fight for elimination of bus competition. It has refused to relay tracks in connection with the rebuilding of Charlestown Avenue from Silver to Vincennes Street, alleging that it preferred giving up the franchise to going to the expense of rebuilding the trackage, in face of the bus competition, which was making the line unprofitable. Efforts to pass an ordinance to eliminate bus competition failed at first. The Indiana Public Service Commission was asked to take a hand and force the company, but the commission had no power in the matter. Later an ordinance was passed barring buses on Main, Market, Spring, Vincennes, State and Pearl Streets and on intersecting streets within a distance of 300 ft. in any direction from street railway lines.

Franchise Rights Bought. — The Northern Ohio Traction & Light Company, Akron, Ohio, has purchased the franchise rights of the Cleveland-Akron Bus Company for $500,000, according to dispatches from Kansas City. This purchase was referred to in the ELECTRIC RAILWAY JOURNAL of Oct. 18 in connection with the rejection by the City Commissioners of Kansas City, Kan., of the petition of the H. H. Moore Company to buy the bus line, already operated by P. H. Kennedy. The Akron purchase price does not include bus equipment. Bus rates between the two cities recently have been raised to $1.40 for a one-way trip, while the traction fare is only $1.

Will Sell Token Carriers.—To facilitate the handling of passengers and as an insurance against the loss of tokens the Philadelphia Rapid Transit Company's conductors will sell token carriers. The plan is for the passengers to give the conductor $1 for which they will get the current ride and the nickeled carrier containing twelve 7½-cent tokens, making thirteen rides and the carrier. The carrier is about the shape of a small pocket knife, with three spring-protected openings to accommodate four tokens each.

Working Out Bus-Railway Problem.—Marlboro, Mass., city officials are endeavoring to work out an arrangement so that bus lines and trolleys, even though the former are privately owned, can operate to the mutual satisfaction of both. A conference was brought about as a result of a letter sent to the Mayor of Marlboro by General Manager Henry C. Page of the Worcester Consolidated Street Railway protesting against the bus line between Marlboro and Westboro taking on passengers along the line of the street railway on the West Main Street in Marlboro. Manager Page explained to the city officials that the bus activities were affecting the business of the railway, and if it could not get the full benefit of the passenger traffic along its line it would be unable to continue operation in Marlboro.

Council Meets, but Takes No Action.—The City Council of Omaha, Neb., closed its recent conference, at which the Mayor and Commissioners were present, without formal action on the request of the Omaha & Council Bluffs Street Railway to be relieved of its occupation tax and paving requirement. The Council will meet again to take formal action and prepare an answer to the question of the street railway. The alternative for the traction company, if Mayor Dahlman's recommendation prevails in declining to lift occupation tax and paving requirement for 1925, will be to apply to the Nebraska Railway Commission for an increase in street railway fare. General Manager Leussler stated that total revenue passengers of the Omaha lines during the first eight months of this year were 1,811,143 fewer than in the corresponding period of last year. The ultimatum of the railway submitted to the City Council of Omaha on Sept. 17 was reviewed in the ELECTRIC RAILWAY JOURNAL of Oct. 4.

Awaits Company's Decision.—Union employees of the Rochester, Lockport & Buffalo Electric Railway, Rochester, N. Y., are demanding an increase of 4 cents an hour, from 53 to 57 cents, for trainmen, with proportionate increases for all other employees. The demand has been before a board of arbitration since last May. On Oct. 9 the board announced that it could reach no agreement with the two factions and was dissolved. Following the failure of arbitration, the men renewed their direct demand on the company and a conference followed, after which it was announced that General Manager Foster had taken the demands of the men under advisement and would announce his decision shortly. This action postponed a threatened tie-up.

Studies New Type of Car.—The Wisconsin Railroad Commission is making an investigation of a new type of one-man car, which calls for exit of passengers at the rear door. One of the commission's engineers has been sent to Washington, D. C., where two such cars have been placed in operation for experimental purposes. It is said that if the engineer's report is favorable it is likely that the commission will ask the Wisconsin electric railway companies to provide their new one-man cars with the rear-exit device.

Proposed Fare Increase Suspended.—The Board of Public Utility Commissioners of New Jersey issued an order on Oct. 21 suspending until Jan. 22, 1925, the proposed increase in fares on the Shore Fast Line and the Atlantic City & Suburban Railway, the two trolley systems operating between Atlantic City and points on the mainland. Both railways contend that they are not earning a fair profit on their investments.

Will Protest Fare Petition.—S. V. Stewart, city attorney, was instructed formally by the Helena, Mont., City Council recently to protest the action of the Helena Light & Railway Company, which seeks authority from the State Railroad and Public Service Commission to raise its fare and to avoid payment of royalty alleged to be due the city under the original franchise. The royalty, which formerly amounted to some $7,000 a year, according to city officials, has not been paid for about four years. Litigation in this connection has been pending for a long time.

Abandoned Line to Be Revived.—The North Hornell division of the Hornell Traction Company, Hornell, N. Y., which was abandoned last summer because the company was unable to operate the line at a profit, will be revived by the traction company under a ruling of the Public Service Commission. After a hearing held by Commissioner VanNamee, the company was granted an order to restore service temporarily, and this will be done at once. It is proposed to operate one-man cars on the line by the Hornell Traction Company.

May End Franchise.—As the result of a resolution sponsored at the recent meeting of the City Council of Windsor, Ont., Windsor is likely to terminate the present franchise of the Windsor, Essex & Lake Shore Railway, Kingsville. It will probably insist upon the road operating under a 5-year franchise in the future. Alderman Howell, who introduced the resolution, claimed the city was deriving no income under the present franchise, issued in 1906. The city solicitor will be asked to make a ruling in the matter.

Allowed to Operate One-Man Cars.—The Railroad Commission of Wisconsin has granted permission to the Northern States Power Company, Eau Claire, to operate one-man cars on its interurban line between Eau Claire and Chippewa Falls, Wis. The provision is made that two-men crews must be used when heavy traffic is anticipated as during the times of fairs and conventions.

Will Reopen Stations. — Following protests from residents of the affected sections, the Philadelphia Rapid Transit Company will reopen the northbound Frankford elevated stations at Berks Street, Church Street and Torresdale Avenue, closed some three weeks ago because of their poor patronage. In its Oct. 27 issue of "Service Talks," the company points out that in 1923, to pay operating costs and city rental, the average carload per trip on the "L" should have been 86 passengers, but the actual records show that there were only 56. The car-riding population of Frankford has increased but slightly since 1922 and this increase has been largely drawn from other sections of the city served by the Philadelphia Rapid Transit lines. The company now operates almost as many street cars to the Frankford district as it did before the elevated line was built. In spite of the new high-speed service, the company states, the public demands the same street car service.

Foreign News

The First Electrification of the French P.L.M. Railway

The first electrification project of the Paris - Lyons - Mediterranean Railway, will go into effect on the international line between Culoz and Modane, en route for Italy via the Mont Cenis tunnel. There are grades as high as 3 per cent, and sharp curves. With the heavy international traffic of passengers and freight this will be the most severe try-out of long-distance electrified trains possible in France.

The railway will purchase power for this section from the Paul Girod electric steel plant, a privately owned and operated plant, which was erected during the war and planned on lines which would enable it to supply an almost unlimited amount of excess current to meet any possible needs in these parts. This plant now has in operation seven separate hydro-electric stations.

Trackless Trolleys for Ipswich and Darlington, England

Substitution of trackless trolleys for tramways has been decided upon by the Ipswich Town Council. An experimental trackless trolley route was very satisfactory. While traffic in Ipswich is not heavy, some of the streets are so narrow that there is not sufficient space between the track and the curb for other traffic.

Darlington Town Council has also definitely decided to substitute trackless trolleys for their tramways.

Parliamentary powers will be necessary in both cases.

Station Improvements in London

Trafalgar Square station of the Baker Street & Waterloo Railway, London, England, is being completely reconstructed. Pedestrian subways will be constructed to provide safe crossings at one of the most dangerous points in London where several main thoroughfares converge at Charing Cross. The underground railways will make a large contribution toward the cost of these subways.

In 1906, when this station was opened, it was used by less than 1,000,000 passengers. In 1923 there were 5,500,000. Four lifts formerly in use will be replaced by escalators, increasing the passenger-carrying accommodation and allowing enlargement of the booking hall. The escalator tunnel will be 90 ft. long by 22 ft. 4 in. in diameter and will have to be cut through an existing subway.

To speed up reconstruction of Oxford Circus station, work is being carried on night and day. The escalator shaft, 100 ft. long by 17 ft. in diameter, is constructed at an angle of 30 deg. The bottom end joins a chamber which rests on the westbound tunnel of the Central London Railway. The top of this tunnel had to be cut away and roofed with steel girders to take the weight of the new chamber. In order to roof over the top of the escalator shaft, which is only 4 ft. below the street surface level, and to construct the adjoining section of the new station, a network of gas, water and hydraulic power mains and high-tension electric cables had to be removed and relaid in different positions. Some of the mains are of 21, 24 and 30-in. diameter.

New Tramway Track to Be Constructed in Edinburgh

More than a mile of tramway track is to be constructed by the Edinburgh Town Council at an estimated cost of £29,400. At present 16 of the 24 routes of the Edinburgh system operate through Princes Street, which means a car every 15 seconds in each direction during the busy periods of the day. The new track is to be constructed on George Street, a short distance north of Princes Street, and it is expected that the new track will greatly accelerate traffic.

Construction of two suburban extensions aggregating about 2 miles in length, at an estimated cost of £47,460, has also been recommended by R. S. Pilcher, general manager of the tramways.

Zürich Shows Higher Receipts

The annual report of the Zürich Municipal Railway shows an increase during 1923, as compared with 1922, of 2,195,646 passengers, or about 4½ per cent. The line was extended last year about 2½ km., and the length of track in the street now is 85.047 km., and 7.872 km. in carhouses and shops. In 1923 the system had 241 motor cars and 87 trailers. The principal operating statistics follow:

	1923	1922
Car-kilometers	11,550,356	11,400,343
Car-miles	7,218,972	7,125,214
Passengers carried	48,469,502	46,273,856
	Francs	Francs
Passenger operating rev.	11,774,656	11,577,076
Receipts per passenger	0.243	0.250
Rev. from other sources	205,231	197,732
Gross rev. per km. of track	275,706	287,896

Paris Subway Power Contracts Revised

The Paris Metropolitan subway has had, ever since its inception, a contract for a portion of its electric power with the Société d'Electricité de Paris. The price was based on production costs at the central station owned by the Metropolitan Company. This station being out of date, the cost of current is admittedly higher than it should be. For this reason the Société d'Electricité, with its modern equipment, has been profiting from an arrangement which was clearly to the detriment of the subway company.

A new agreement just made will assure the subway company current from the electric company on an entirely new basis which will result in a reduced price to the municipality of Paris, which now owns the subway. The agreement is retroactive from Jan. 1, 1924. The subway company agrees to spend the saving on the current it takes from the Société d'Electricité in renewing the equipment of its own plant. The new arrangement extends until 1955.

Saving through Electric Operation.—Electrification of the main line railways of Great Britain would mean a saving in locomotive costs of £21,000,000 a year, was stated by Lieut.-Col. E. O'Brien, electrical engineer of the London, Midland & Scottish Railway, at a meeting of the Institution of Locomotive Engineers. He said this saving would result because the electric locomotive is capable of double the mileage of the steam locomotive and the cost of repairs is from one-third to one-seventh that of steam engines.

Glasgow Officials Confer on Traffic Problem.—In reply to the suggestion that the tramway routes in Glasgow, Scotland, be discontinued in the congested area and buses be used to connect the different tramway routes, a report was prepared by James Dalrymple, tramway manager. In the report he expressed the opinion that this should not be done until the results on congestion of the two new bridges erected over the River Clyde can be ascertained. These are expected to relieve congestion in a large measure. The joint committees of magistrates and the tramway department, at a meeting on Oct. 8, decided to adopt this recommendation.

Buses Confined to Tramway Lines in Aberdeen, Scotland.—That the tramway company was not entitled to operate motor buses beyond the limits of the tramway system was the decision in a suit brought in the Aberdeen Sheriff Court against the Aberdeen Suburban Tramways. This company was operating a number of buses, running far out into the country. Such operation was held to be illegal, as Parliament only gave them power to build, work and maintain their tramway undertaking.

Owl Cars in Liverpool Unprofitable.—All-night tramway service on the municipal lines of Liverpool, England, has proved so unprofitable that it is to be discontinued. Statistics furnished by the manager showed that on most trips there were no passengers or only one or two. All-night cars are operated in only a few towns in Great Britain and only by the municipalities.

Tramway Funds Used to Relieve Tax Burden.—£12,000 of an income tax rebate of £18,000 was transferred from the tramways department to the relief of local taxes by the Cardiff, England, Town Council. This action was taken in spite of the fact that the chairman of the Tramways committee advised the Council that the tramways department required about £145,000 for improvements, £45,000 for purchase of 25 additional cars and £100,000 for various other tramway and bus requirements.

Financial and Corporate

Award Increased

Privy Council Adds $838,500 to Arbitration Price of Toronto Railway —City Cost Placed at $13,650,000

The city of Toronto will have to pay the Toronto Railway a sum of approximately $300,000 in excess of the amount awarded by the arbitrators, is the substance of the recently announced decision of the judicial committee of the Privy Council at London, England, in the Toronto Railway arbitration dispute. The appeal of the city was to decide what amount the city should pay the Toronto Railway for its property. The judgment forces the city of Toronto to pay $11,483,500 for the Toronto Railway, an increase of $838,500 over the amount as it stood before the appeal went to London, and an increase of $295,000 over the original award. In addition, the city will very likely have to pay interest at 5 per cent from Sept. 1, 1921, the date of taking over the railway.

CITY MUST TAKE OVER MAIN OFFICE

The final cost of the property to the city, including the award proper, the interest and city's costs will approximate $13,650,000. The Privy Council added the sum of $140,000 for the steam plant, $338,500 for batteries, $65,000 for the Sherbourne property, $170,000 for the head office building and $125,000 for the share of the cost of Don Bridge and Avenue Road subway. This made the total award, excluding interest, $11,483,500.

The judgment states that the city should take over and pay for the company's main office, and that the city should reimburse the company for the amount it was taxed on the Avenue Road subway and Don Bridge up to the date of taking over the railway plant. The properties which the company contended the city should pay for and which the city rejected totaled in value, according to the arbitrators' award, $543,500.

The Privy Council entered into the history of the arbitration and referred especially to two points raised in support of the city's appeal. First, the city contended that while in valuing certain property, particularly the rolling stock, buildings and tracks, the arbitrators had proceeded on the theory that in every case the cost of reproduction, less depreciation, must be taken, no such method should have been applied in the present case. The proper course, it had been urged on behalf of the city, was first to consider whether, having regard to the size, suitability of location and other factors, a reasonable person would reproduce these assets as part of the Toronto Railway Company's system in 1921, and if not to value them on the basis of what they would bring at a sale or in case that were impossible on a scrap basis. In the opinion of the Privy Council, this argument was wrong, the arbitrators being justified in taking reproduction cost less depreciation as a reasonable guide in valuing track and rolling stock. But it was made clear that by no means were reproduction cost, less depreciation, adopted as the only and sufficient test of value.

It was also contended on behalf of the city that the theory of reproduction at current prices could not be applied at a time when, with abnormal prices actually being present, no reasonable man would reproduce the parts. The Privy Council agreed with the arbitrators in holding that they were under no obligation to proceed on any such imaginary basis. The judgment said that at the time the valuation was made the arbitrators said prices had become fairly stabilized and in determining the actual value at that time they were entitled to have regard to prices then generally current.

On the cross-appeal of the company, the judgment disagreed with the Canadian Supreme Court concerning the arbitrators' jurisdiction regarding the valuation of certain items. It was impossible for them, the judgment says, to fix a sum without incidentally determining what items were to be included.

The judgment said that the value of the items allowed by the arbitrators, amounting to $543,500, should be restored to the award. As to the particular items ruled out by the arbitrators and which were in question in the cross-appeal, the above-mentioned money considerations were added. The cost of both appeals will have to be borne by the respective parties, according to the judicial committee.

INTEREST ISSUE TO GO TO OTHER COURTS

Disappointment was felt on the question of interest not being cleared up by the Privy Council. It is figured that the company will be granted this by the local courts, but it may again be the means of opening a lengthy discussion. The council agreed with the view taken by the appeal court that the general rule under which a purchaser who takes possession is charged with interest on the purchase price from that time until it is paid was well established, and had on many occasions been applied to compulsory purchases, but stated that the matter lay outside of arbitration for its enforcement.

The decision reviewed by the Privy Council was rendered on Jan. 31, 1923 by a majority of three members of the Toronto Railway board of arbitration in the long-drawn valuation case valuing the system at $12,000,000. The sessions had been held on 158 days and evidence taken totaled 5,000,000 words. Sir Adam Beck, the minority member, filed a brief dissenting report saying that he was unable to concur in the conclusion as to the method which should be adopted in ascertaining the value of the railway plant and equipment, and also dissenting from the statement of the majority as to certain of the property which the railway claimed should be valued as property required for the operation of the railway. Among the prominent engineers engaged in the case for the company were Hagenah & Ericson of Chicago, A. L. Drum of Chicago and M. E. Cooley of Ann Arbor, Mich. Jackson & Moreland of Boston were in charge of the case for the city, assisted by Prof. A. S. Richey of Worcester, Mass., who valued the rolling stock. Following the appeal of the city to the first divisions court against the amount and the subsequent reduction by $543,500 the city announced its dissatisfaction again and in the fall of last year announced its intention of appealing to the Privy Council.

Since the decision of the Privy Council Toronto Railway shares have advanced to 108, an increase of 4 points. When the arbitration began the stock was sold at 70½ and after the decision was announced it went up to 94½.

It was reported after the announcement of the award that the City of Toronto will soon float an $8,000,000 loan to finance the purchase of the Toronto Railway. It was stated in the ELECTRIC RAILWAY JOURNAL, issue of Oct. 11 that a loan of about $7,000,000 was expected, to be on a competitive basis.

New Plan of Settlement for Suburban in St. Louis

Members of the bondholders' committee of the Suburban System of the United Railways, St. Louis, Mo., have stated that a new plan of settlement for them in the reorganization has been submitted. While the details of the new plan for the Suburban has not been revealed, it is said to provide for payment in full at par and interest of the $2,000,000 consolidated first mortgage Suburban bonds, while the $4,500,000 Suburban 5s would be extended under an agreement whereby $1,000,000 of the bonds would be retired in ten years at the rate of $100,000 annually and at the end of ten years the balance of the issue would be retired at par and accrued interest. The bonds would be first lien against the Suburban properties, but would not be guaranteed by the new company.

Judge Faris in the United States District Court on Oct. 25 declined to dismiss the suit of the Suburban bondholders for a separate receivership for that property and granted the request of the city of St. Louis to be permitted to intervene in the Suburban suit. He then continued further hearing of the case until Nov. 8.

Sam B. Jeffries, counsel for the Suburban interests, at the hearing asked Judge Faris not to make any further rulings in the United Railways case. Judge Faris said he would postpone further action on the petition to consolidate all of the United Railways cases which had been set for Oct. 25.

Files Abandonment Intention.—The New York & Long Island Traction Company has filed a certificate in the office of the Secretary of State declaring its intention to abandon a portion of its line at Ozone Park and on Rockaway Road, Long Island.

Portsmouth Property Cannot Share Traffic

If a proposed bus line in Portsmouth, N. H., is permitted to operate, the discontinuance of the Portsmouth Electric Railway is very likely. This was brought out at the hearing before the Public Service Commission by counsel for the Boston & Maine Railroad, owner of the Portsmouth Electric Railway on the petition of Joseph Cavarette to operate a bus line in the city of Portsmouth and between Portsmouth and Rye Center, paralleling and competing with the lines of the Portsmouth Electric Railway.

The attorney presented figures to show that the number of passengers using the cars had decreased nearly 50 per cent from 1916 to 1923, while the cost of operation in the same period, even with great economy, had increased 50 per cent, and although passenger fares in the same period increased 89 per cent, passenger revenues diminished 3 per cent, so that the operating expense per car-mile in 1923 was more than 35 cents, while the operating revenue per car-mile was only 27½ cents. He stated further that the great increase in the number of people using automobiles made it improbable that the electric line could ever be made to pay its operating expenses.

Revision of the Richey Wage Index

The Street Railway Wage Index which is compiled monthly by Albert S. Richey will be revised in succeeding issues of this paper by a change in the weighting employed in its construction. Heretofore, the index has been weighted in accordance with the number of passenger cars operated by the various companies. In the revision, the weighting is in accordance with the number of trainmen (conductors, motormen and one-man car operators) employed by the various companies. The revised index will represent more correctly the trend of electric railway trainmen's wages, although the change is but slight, as will be noted in the following table, where the former and revised wage index numbers are shown in parallel columns for 1923 and 1924 to date:

	1923		1924	
	Former	Revised	Former	Revised
January	207.4	207.1	218.9	217.4
February	207.3	207.1	219.0	217.4
March	207.3	206.8	219.0	217.5
April	207.3	207.0	219.1	217.7
May	208.2	209.0	219.3	217.8
June	209.6	212.6	220.4	220.0
July	211.8	213.5	221.4	220.0
August	213.7	216.2	221.4	220.0
September	214.7	216.4	221.4	220.1
October	217.5	216.4	221.9	220.6
November	218.2	216.4		
December	218.2	216.4		

The wage index, as revised in succeeding issues, represents, on the base of 1923 = 100, the trend of maximum hourly wages of street and interurban railway platform men of about 100 of the largest companies in the United States, weighted according to the number of men so employed. It is a part of the "Conspectus of Indexes" issued monthly by Mr. Richey, and published regularly in the Corporate and Finance Section of the fourth issue each month of the ELECTRIC RAILWAY JOURNAL.

Purchase Negotiations Started.—Dispatches to Toronto from New Orleans, La., state that negotiations for the purchase of the South New Orleans Railway & Light Company have been opened up with financial interests in New Orleans and New York. The price is understood to be in excess of $800,000. The line, the successor to the South New Orleans Light & Traction Company, is 6.5 miles long and connects Algiers and Gretna. E. W. Burgis is president and general manager. It is said that an agreement to take over the property will be executed as speedily as possible.

Allowed to Destroy Cars.—Permission was granted recently to the Trenton & Mercer County Traction Corporation by the New Jersey Board of Public Utility Commissioners to abandon four of its double-truck and nine single-truck passenger cars and to charge against the company's depreciation fund $55,000 less any salvage which may be secured in the destruction of the cars.

Wants to Abandon Line.—The Mauch Chunk & Lehighton Transit Corporation, Mauch Chunk, Pa., has asked permission to abandon its service between Flagstaff and Lehighton, Pa., a 12½-mile route. The company plans to substitute a bus service.

Action on Security Issue Withheld.—The New Jersey Board of Public Utility Commissioners has withheld action on approval of an issue of securities by the Red Bank & Keyport Railway, to be used as capital stock, until the company has obtained proper franchises to operate through all municipalities on its line. The tracks and other physical property of the applicant were purchased by Herman C. Schlicting from the Jersey Central Traction Company, which the commission authorized to discontinue operations in an order of July 12, 1923. Mr. Schlicting organized the Red Bank & Keyport Railway for the purpose of taking over the old concern's existing property, providing new cars and furnishing street railway transportation over a portion of the lines of the Jersey Central Traction Company in the northern part of Monmouth County. The application dismissed recently was for an approval of certain securities to complete the financing of the new company.

Seeks to Discontinue Line. — The Lykens Valley Railway, Williamstown, Pa., has petitioned the Public Service Commission to discontinue its line between Williamstown and Reinerton via Tower City because it was unable to operate profitably. At the same time an application was received from stockholders of the railway company, organized as the Williams Valley Transportation Company, seeking authority to operate buses as common carriers to replace the trolley service. The Lykens Valley Railway, which is the reorganized Lykens & Williams Valley Street Railway, is 10 miles long. The company owns 7 motor passenger cars, 3 motor service and 1 trail service car.

Hearing on Abandonment Set. — Hearing will be held before Public Service Commissioner Oliver C. Semple at New York Nov. 10 on the petition of the Yonkers Railroad for permission to abandon a portion of its routes and franchises in the city of Yonkers. The routes proposed to be abandoned are the Nepera Park, Elm and Walnut Street, Tuckahoe, Bronx River Road and Central Park Avenue lines.

Hotel on Carhouse Site. — Realty Associates and Bing & Bing, Inc., have sold the old carhouse block front on the east side of Seventh Avenue between Fiftieth and Fifty-first Streets, New York, to William and Julius Manger, owners of the Manger chain of hotels, for a twenty-story hotel building. The site of the new Manger hotel is a part of the old New York Railways carhouse block, 200x800 ft., between Sixth and Seventh Avenues, acquired last August by Realty Associates and Bing & Bing, Inc., from the Broadway & Seventh Avenue Railway.

Preferred Stock Offered to Customers and Employees.—The West Penn Company, Pittsburgh, Pa., through the West Penn Securities Department, Inc., is offering to its customers and employees 7 per cent cumulative preferred stock, at $94 per share. Payment may be made either in cash or on the partial-payment plan. Under this plan from 1 to 100 shares may be subscribed for by an initial payment of $6 a share and a monthly payment of $8 a share.

Names Director. — Benjamin H. Namm has been designated by the New York Transit Commission as a director to represent the public on the board of directors of the Brooklyn-Manhattan Transit Corporation, Brooklyn, N. Y. Major Namm's appointment fills the vacancy caused by the resignation of Travis H. Whitney, now vice-president of the corporation.

Seeks to Purchase Railway Stock.—The Niagara, Lockport & Ontario Power Company presented a petition to the New York Public Service Commission on Oct. 27 asking for consent to purchase all of the issued and outstanding capital stock of the Warren & Jamestown Street Railway, which runs between the Borough of Warren, Warren County, Pennsylvania, and the city of Jamestown. The stock of the railroad is owned by the Venango Public Service Corporation of Pennsylvania. The petition states that the company could furnish motive power to the railroad either directly or through its subsidiary, the Western New York Electric Company, and could effect economies by using the existing transmission lines of the railroad for the distribution of electricity for light, heat and power.

Income Increases.—For the first nine months of the present year the Washington Railway & Electric Company, Washington, D. C., had net income of $743,487, while during the same period in 1923 the income was $588,456. Operating revenues declined from $3,726,794 in the period of 1923 to $3,550,968 for the nine months' period of the current year. Expenses also decreased from $3,075,664 in 1923 to $2,840,772 in the nine months of the current year.

Vote to Sell Power Plant.—Directors of the Holyoke Street Railway, Holyoke, Mass., voted unanimously Oct. 28 to sell its power plant on the Connecticut River bank to the Turners Falls Power & Electric Company and make contracts for energy for operating the electric railway system. The sale price is said to be $400,000. The stockholders will meet Nov. 18 to take action on the plan. The reported sale of the power house was referred to in the ELECTRIC RAILWAY JOURNAL, issue of Oct. 25.

Orders Properties Sold to Cities.—Municipal ownership of car lines in De Kalb and Sycamore, Ill., is assured by an order entered by Judge Fulton in the De Kalb County Circuit Court authorizing A. D. Mackie, receiver for the De Kalb-Sycamore & Interurban Traction Company, to sell the properties to each city. The line between the two cities will be abandoned, being unprofitable.

Legal Notes

CALIFORNIA.—*Instruction on Last Clear Chance Doctrine.*

Instruction by the court in a "last clear chance" case that the company was liable if the motorman knew or should have known, by facts which would ordinarily come within the observation of an ordinary, reasonably careful man, that the plaintiff was lying on the track, when actually the motorman had his head to one side and was looking over his right shoulder, was held erroneous. (Alcamizi vs. Market Street Railway. 228 Pacific Rep., 410.)

CALIFORNIA. — *Land Conveyed for a Public Highway May Be Used for that Purpose to the Extent that the Convenience and Welfare of the Public May Demand.*

The State Highway Commission of California purchased a strip of land for a public highway and later instructed an interurban railway to relocate its tracks so that they would occupy the strip thus purchased. The seller of the land then brought suit against the railway for the wrongful taking of his property, making several complaints. The court held, however, that where land is conveyed for a public highway, the implication must be that it will be used as the convenience and welfare of the public may demand, and that the kind of use may change as the demand is augmented by the increase of population. An abutting property owner is not entitled to compensation anew for every improvement in the street or type of vehicle used on it or with every change made imperative with such an improvement, especially where, as in this case, the conveyance with knowledge that such a change would probably be made. [Callopy vs. United Railroads of San Francisco, 228 Pacific Rep., 59.]

FEDERAL COURT. — *Powers of City in Contracting the Purchase of Street Railway Limited by Enabling Statute.*

The city of Seattle agreed to take over the railway system in that city on Feb. 10, 1919, free and clear of every incumbrance for the sum of $15,000,000, to be paid in the way specified in the contract and this contract was ratified by the City Council. The actual transfer was not made until March 31, 1919, owing, at least in part, to the suit of a taxpayer to enjoin the sale, but this plea was denied. In the meantime, state, county and municipal taxes, amounting to $401,017, became a lien on the property on March 15. In view of this fact, the company and city agreed that the former would assume one-quarter of these taxes and the latter the remaining three-quarters. The court held, however, that the power of the city in making the purchase was limited by the statute to the plan adopted, which did not provide for payment of any taxes by the city, and that whatever legal rights the company might have against the city on the contract for repayment of taxes do not permit it to impose a lien on the property for this payment. Its payment of the tax, to avoid a sale of other property, did not entitle it to subrogation of the tax lien on the property conveyed. [Puget Sound Power & Light Co. vs. City of Seattle, 300 Federal Rep., 441 and 443 (two cases).]

LOUISIANA.—*Grant of Land on Condition of Construction of Railroad Not Defeated When Railroad Is Discontinued.*

A property owner sold certain land to another on condition that an electric railway should be built alongside the property within 16 months. The road was built, operated continuously for about four years and intermittently for another year, and was then discontinued and the rails taken up. A suit was brought to determine whether the heirs of the original owner had a reversionary interest in the property. The court held that the agreement required the construction of the line, not its operation for any definite length of time, and that the title was valid in spite of the abandonment of the line. [Bush vs. Bolton et al., 100 Southern Rep., 692.]

NEW JERSEY.—*Street Car Lines Asking Protection Against Unjust Competition and Municipal Authorities Giving that Protection Not Liable for Damages Unless Actuated by Improper Motives.*

Two suits for damages were brought by jitney operators on the charge that the defendant railway company conspired with public officials and carried on a campaign of libel, malicious prosecution and conspiracy to destroy the plaintiffs' business. The court pointed out, however, that the railway owed to its stockholders the duty of securing all legal protection against unjust and unlawful competition. It also said that the public authorities are the custodians of the public highways in many respects and must stand for the protection of the rights of the public therein. The public is interested to see that transportation on these highways is efficient, responsible and supplied at the lowest cost. The public authorities are also interested in the protection of the highways against unreasonable use. There was nothing, in the opinion of the court, to indicate that the authorities had improper motives in enforcing the ordinances complained of, and a new trial was denied. [Kelly vs. Morris County Traction Co. et. al., also Seldney vs. same 126 Atlantic Rep., 24.]

OHIO.—*Waiver of Stockholders' Liability for Corporate Debts Valid and Effective as to Stockholders in a Successor Consolidated Company.*

Up to 1903 stockholders in Ohio companies were liable for the debts of the corporation to the extent of their stock and also for an amount equal to the stock held. In 1900 the Southern Ohio Traction Company issued bonds containing a waiver of such individual liability, and in 1902 the company was consolidated with another to constitute a third corporation. In 1916 the company became insolvent, and the bondholders of the Southern Ohio Traction Company brought suit against the stockholders of the consolidated company for their interest and principal. The court held, however, that the waiver was valid and applied also to the stockholders in the successor consolidated company. [Marfield vs. Cincinnati, D. & T. Traction Co., et al., 144 Northeast Rep., 689.]

RHODE ISLAND.—*Status of Attorney for Minor Claimant.*

A claimant, eighteen years old, had an agreement with an attorney to pay him one-third of damages recovered from a railway company but later made a direct settlement with the company, and the attorney sued the railway under the "attorney's lien law." A defense was that contracts with minors are voidable, but the court held that the question whether the attorney had a contract, whether his services were necessary and the value of his services before they were repudiated, should be determined by a jury. (Jacobs vs. United Electric Railways, 125 Atlantic Rep., 286.)

WASHINGTON. — *Overhang of Cars on Curves. Last Clear Chance.*

While a pedestrian is guilty of contributory negligence if he places himself in danger from the overhang of an ordinary street car as it rounds a curve, he is not thus guilty if the car extends over the sidewalk to a much greater extent than an ordinary car. The "last clear chance" doctrine applies where plaintiff's negligence continues up to the time of injury, if the defendant actually sees the peril, or if the plaintiff's negligence has terminated and the defendant did not actually see the peril but by exercise of reasonable care should have seen it. (Leftridge, et al vs. City of Seattle. 228 Pacific Rep., 302.)

Personal Items

Celebrate Subway Birthday

Twentieth Anniversary Commemorated by a Dinner to Honor President Hedley

The New York subway has so passed into the realm of accepted things that it is hard to realize the system is only 20 years old. Yet passengers were carried for the first time on Oct. 27, 1904. Trains began running at 7 p.m. on that day, and up to midnight 111,881 tickets were sold. The proceeds, $5,594.05, were turned over by the Interborough to charity the next day.

These and other facts relating to the early history of the Interborough Rapid Transit Company were recalled on Oct. 27, when a complimentary dinner to honor Frank Hedley, president of the company, and commemorate the twentieth anniversary of the subway was given at the Hotel Commodore. About 600 men prominent in railroad, financial and business circles were present.

Frank Hedley

The fittings of the dining room were appropriate to the railroad aspects of the meeting. The waiters wore the standard caps of Interborough guards. Every table carried a railroad lantern, either red or green, and over the speakers' table was a full-sized front vestibule of a standard car with markers and destination signs. Entrance to the dining room was possible only through one of four standard turnstiles of the Interborough, in which a nickel had to be dropped. Later this nickel was returned with a German 1,000-mark bill inside a souvenir bill case with the statement: "The New York Subways always have returned to every customer more than full value for every nickel received."

In the reception room were shown the spade with which the first dirt was removed for the building of the subway, the pick and crowbar probably used when ground was officially opened, and a silvered spike driven in the early days to commemorate the completion of the subway.

William G. Besler, president Central Railroad of New Jersey, officiated as toastmaster at the dinner, and after the repast August Belmont, long president of the Interborough, told about the early trials of the undertaking and how Mr. Hedley was selected for his job. Mr. Belmont said in part:

> Thirty-four years ago I became interested in the ownership of the Kings County Elevated road, which was subsequently sold to the B. R. T., and while we owned it Mr. Hedley was in our employ. He then went to Chicago and was doing good work out there in rapid transit when we needed him here to run our subways. He has been with the company ever since. Even London, whose transit system needed badly somebody to untangle it, could not induce Mr. Hedley to desert his task of perfecting New York's subway system. On Sept 7 of next year I shall have been fifty years in the financial world as a director of various enterprises. In that length of time one gets to know men. In all my career I have never known a man more devoted to his work than Mr. Hedley. The operation of the subway is his sole work and great ambition. The day will come when New York will realize the debt of gratitude it owes to Frank Hedley.

Dr. J. Duncan Spaeth, professor of English at Princeton University, cited the guest of the evening as one who had been able to transform promise into performance and spoke of the benefit of rapid transit by which workmen were able to have more time at home instead of spending it in transportation. He referred humorously to the crowds during the rush hour, but said that it was the greatest tribute to the popularity of anything that more was wanted than could be given. He referred to Mr. Hedley as coming from a family prominent in past years in transportation and paid a marked tribute to the engineering type of mind because of its ability to control the forces of nature. In his opinion, the greatest need today is a reconciliation and coordination of technical power, financial power and political power.

Neal O'Hara of the editorial staff of the New York *Evening World* gave a humorous talk on "Styles and Turnstiles," and there were recitations and singing, led from the platform of the model car over the speakers' table.

The evening concluded with the presentation of a reel of moving pictures showing Mr. Hedley on his "farm" at Green's Farms in Connecticut, where he gets rest by performing the manifold duties of farm life.

Mr. Hedley said that when the subway was opened many people, even many railway men, doubted the practical possibility of transporting people underground. He said that Mr. Belmont was the real father of subway construction and operation in New York and deserved the largest share of credit for making the subway possible. He also spoke of Mr. Bryan, Mr. Shonts, his own assistants and the loyalty of the employees, which had made the undertaking possible. He said that his work in connection with the subways had been a great pleasure to him. He hoped he had given service to the public. This had been his intention in the past and would be in the future.

President Robert Resigns

Head of Montreal Property Resigns After Fourteen Years to Look After Other Interests

E. A. Robert, president of the Montreal Tramways since 1910, has resigned. When Mr. Robert took office the old franchise of the Montreal Street Railway with the city of Montreal was drawing to a close. It became necessary to draw up a new contract. After prolonged negotiations with the civic and provincial authorities, he finally secured a franchise by which the company was guaranteed a reasonable return on its investment while the development of the system was assured. Under this agreement a Tramways Commission was appointed, to fix the fares so as to give the necessary income to the company and protect the public. At the same time the commission has to decide on the extensions that are necessary and whether or not the demands of the city are commercially practicable. In other words, while the company is still a privately owned one, the system is practically under municipal control, with the important provision that the city practically assumes responsibility for the financial success of the system. This franchise has worked to the satisfaction of both the public and the company and has been one of the models for study by street railways elsewhere that were beset in a similar manner.

E. A. Robert

The growth of the Montreal Tramways system under the presidency of Mr. Robert is shown by the fact that when he assumed control fourteen years ago the company was then operating less than 600 cars, nearly all of which were single-truck cars. Today more than 1,200 of the latest model double-truck cars are in use, including many trailers, while the trackage has been increased 50 per cent. In 1912 the number of passengers carried was 210,000,000, while last year the number was 290,000,000. The gross earnings under Mr. Robert's management increased from around $6,500,000 in 1912 to more than $12,500,000 last year.

In addition Mr. Robert authorized the construction of several new carhouses and installed an emergency steam plant, which has proved of great benefit when there have been temporary dislocations of the regular supply of electric power for operating the cars.

The system is now reaching out to every part of the island of Montreal, and today in many parts of the city improvements are being carried out which were authorized by Mr. Robert previous to his retirement.

Mr. Robert came into prominence in Montreal about 1904 by his application to the Quebec Legislature for a charter to develop a small water power at St. Timothee, near Montreal. This charter he secured after an able and energetic fight. Despite opposition, Mr. Robert was able to finance the project, and he successfully developed the plant, which began to generate power in the latter part of 1911. This was followed by the absorption of several small power companies on the island. He extended his operations in the suburbs of Montreal, and so successful was this undertaking that he was granted rights to enter Montreal proper and thus establish a competitive source of supply.

While Mr. Robert has retired from the traction and power companies he built up, he has not retired from active business life, as his numerous personal interests are sufficient to keep him busy. Furthermore, according to reports he is working on a power proposition which will entail the development of a power plant of at least 200,000 hp., situated within 35 miles of Montreal.

This is only part of the whole story. Moreover, it is only part of the story of his achievement at Montreal. His career was reviewed in the ELECTRIC RAILWAY JOURNAL, issue of April 29, 1922. At that time Mr. Robert had just been elected president of the Quebec Railway, Light, Heat & Power Company in addition to the Montreal post and his other affiliations.

T. F. Mueller, formerly assistant business manager of ELECTRIC RAILWAY JOURNAL and *Bus Transportation*, has been made district manager for the states of Michigan and Indiana, effective Nov. 1, with headquarters in Detroit. Mr. Mueller has been connected with the business department of this paper since January, 1917.

Gen. W. W. Atterbury vice-president of the Pennsylvania Railroad, will become president of the road when President Samuel Rea retires next year. In preparation for this change General Atterbury was moved up on Oct. 29 from his position of vice-president in charge of operation to that of vice-president. It is said among shippers that he knows their business requirements almost as well as he knows the needs of the railroad. He worked himself up from his first job as an apprentice in the Altoona shops of the Pennsylvania Railroad to the president of the American Railway Association in 1916. From August, 1917, to May, 1919, he was director general of transportation of the A. E. F. in France with the rank of Brigadier-General.

Posts of Superintendent of Personnel and of Instruction Filled at Detroit

Two new positions were created on Oct. 1 in the general staff of the transportation division of the Department of Street Railways at Detroit.

Richard Dawson was appointed superintendent of personnel and Herman B. Kirchoff was made superintendent of instruction. Both have been division superintendents for several years. They are directly under E. S. Rider, superintendent of transportation. Their headquarters are at the general offices.

Mr. Dawson will be in charge of matters pertaining to the welfare and conduct of the trainmen. He will relieve Mr. Rider and D. A. Smith, assistant superintendent of transportation, of considerable detail in connection with employees called to the main office as he will sit as chairman of the trial board which hears cases involving the platform men.

Mr. Kirchoff will supervise the work of instruction of new trainmen and of those others who require special instructions.

Of the two men, Mr. Kirchoff has been with the Detroit system the longer. His connection dates back to Sept. 14, 1895, when he started as conductor on the Fourteenth line. Mr. Dawson began as a conductor on the Fourteenth line on July 11, 1899.

Mr. Dawson has been succeeded as division superintendent of the Baker Division by Paul W. Leeson, assistant division superintendent of the Fort Division. B. L. Vail, station master at the Fort carhouse, will succeed Mr. Leeson.

Mr. Kirchoff's position as division superintendent of the Jefferson Division has been filled by promoting Charles Lighthammer, who was assistant division superintendent of that division. John Branigan, service inspector, has been appointed assistant division superintendent in Mr. Lighthammer's place.

Obituary

Henry J. Crowley

Henry J. Crowley, a prominent electrical engineer and general manager of the American Electric Power Company and its successor, the American Railways, since 1899, died Oct. 27 after an illness of two years. Mr. Crowley entered the employ of the Pratt & Whitney Company of Hartford, Conn., following his graduation from high school and served an apprenticeship in mechanical engineering. After completing his apprenticeship, he entered the locomotive shops of the New York, New Haven & Hartford Railroad in Hartford.

Following services with the Schuyler Electric Light Company, he entered the employ of the Thomson-Houston Electric Company and from 1890 to 1893 was manager of the railway department of the company's Southern office at Atlanta, Ga. During this period he was in charge of a number of early electric railway installations, including roads in Atlanta, Macon, Augusta and Savannah, Ga.; Birmingham and Mobile, Ala., and Chattanooga and Memphis, Tenn.

From 1893 to 1899 he was engineer and manager of the General Electric Company's railway department in the Eastern district. During this time he was actively engaged in a number of railway installations, among the more important being Philadelphia, Harrisburgh, Washington, and Richmond. When the American Railways Company was organized in 1899 Mr. Crowley was elected general manager.

Mr. Crowley was a fellow of the American Institute of Electrical Engineers and the American Society of Mechanical Engineers. He was born at Unionville, Conn., 59 years ago.

C. M. Holland

On the eve of the "holing through" of the vehicular tunnel under the Hudson River between New York and Jersey City, Clifford M. Holland, chief engineer, died Oct. 27 at Battle Creek, Mich., where he had gone to recover from a nervous breakdown. He had served the city and the state of New York continuously for 18 years in designing and constructing tunnels for New York city's rapid transit subway system.

Mr. Holland was born in Somerset, Mass., in 1883. After graduation from Harvard University, with both an A.B. and a civil engineering degree in 1906, he went to New York as assistant engineer with the Rapid Transit (later the Public Service) Commission, which was then engaged on the construction of New York's subways. He remained continuously on the city's subway and tunnel work until his appointment in 1919 as chief engineer of the New York-New Jersey Bridge & Tunnel Commission, which was created to construct the great vehicular tunnel under the Hudson.

Among the important New York Subway tunnels to which he was assigned for duty were the Battery-Joraiemon Street tunnel under the East River, the Fourth Avenue subway in Brooklyn, the Whitehall-Montague Street tunnel, the Willoughby-Montague Street tunnel, the Fulton Street subway, the Old Slip-Clark Street tunnel, the Fourteenth Street-North Seventh Street tunnel, and also the Sixtieth Street tunnel.

He took a keen interest in engineering affairs and at the time of his death was a director of the American Society of Civil Engineers and president of the Harvard Engineering Society.

Austin H. Pease, vice-president and assistant treasurer of the Wason Manufacturing Company, Springfield, Mass., died in Springfield Hospital on Oct. 21, after a short illness. He was a son-in-law of the late Henry Pearson, who was president of the company under the old régime and had held the office of vice-president following its absorption by the J. G. Brill Company. After Mr. Pearson's death, about a year ago, Mr. Pease, who had been secretary, was made vice-president. He was 58 years old.

for Discussion of Manufacturing and Sales Matters

Small Coal Consumption Reflects Business Inactivity

Correspondence reaching Washington shows that there was general surprise in the coal trade and among consumers that the country's stocks should have been 47,000,000 tons on Sept. 1, as shown by the report issued jointly by the United States Geological Survey and the Bureau of the Census. In some quarters there is a disposition to doubt the returns. Those who hesitate to accept the figures in the stock report base their attitude on the fact that production was low during April, May and June—lower than in those months of 1921—yet the stock report shows a reduction of only 15,000,000 tons since Jan. 1 and only 4,000,000 tons since June 1.

The explanation of the apparent contradiction between the production and stock figures is that consumption of coal has been at a low ebb. In fact, it had fallen to a lower point than had been realized.

The stock report presents conclusive evidence that the country has been going through a period of dull business, which almost could be characterized as a depression. In the iron and steel industry, for instance, which affects coal more than do many lighter industries, the depression has been severe. The output of pig iron in July was the lowest in any month since February, 1922. To be specific, production of pig iron in July was 1,785,000 tons. This was barely half the rate of production in July, 1923, when it was 3,678,000 tons. Even the July, 1922, production was 2,403,000 tons.

In the first quarter of the year the output of iron and steel was well up around the level of 1923, a very prosperous year, but beginning in April it began to tumble. In so far as the iron and steel industry is concerned it certainly sunk to depression levels in midsummer. It is now moving upward at an encouraging rate, but has not recovered to the point where its consumption of coal is heavy.

One of the reasons why the present period of sluggishness in business has passed without much comment is that business has been spotty. Building and certain other activities have been brisk, but the heavy industries that are the large consumers of coal have been in the doldrums. They have been conspicuously absent for some time from the coal market.

It is noticeable that the changes in coal stocks since Jan. 1 reflect closely the trend of general business. From Jan. 1 to June 1 the liquidation of stocks went on rapidly, but from June 1 to Sept. 1 it was very slow. The fact that there is a heavy reserve still to liquidate is discouraging to the producers of coal and some are counseling curtailment of production, which has been rising sharply for six weeks. There can be no doubt that this would be good business from the standpoint of the coal operator, but from the consumers' point of view it is regarded apparently as good business to continue to buy coal at present prices so as to maintain the reserve.

The stock report shows that the country's reserve of coal is comfortably large. There is no prospect of a shortage this winter unless something unforeseen should occur. It would not be in the public interest for consumers to be lulled into a false sense of security and allow their stocks to fall below the danger line. There is increasing evidence, however, that American consumers at last have learned that ample reserves above ground constitute the best insurance they can have against high prices.

The appearance of the stock report, carrying with it a great surprise for the entire trade, emphasizes anew the need for distribution statistics that are comparable, at least, with those covering production. That the demand for such figures is becoming more and more insistent is indicated by the great amount of attention given the problem as applied to all commodities at the meeting of the Eastern division of the Chamber of Commerce of the United States in Washington.

Interstate Company Spends $586,500 for Equipment

During the twelve months ended Aug. 1, 1924, the Interstate Public Service Company, Indianapolis, Ind., expended for new equipment the sum of $586,500. Of this amount $83,500 was used for the purchase of 11 buses which have been put into operation between Indianapolis and Franklin. Ten new gondolas were purchased for $20,000. The remaining $483,000 was used for the purchase of new sleeping cars, parlor buffet dining cars, express motor trail cars, stock cars, a locomotive, box and ballast cars. References to these purchases were made in the ELECTRIC RAILWAY JOURNAL, issues of Dec. 22, 1923; June 14, July 12 and Oct. 11, 1924.

Important Extensions at Memphis

The Memphis Street Railway, Memphis, Tenn., has spent approximately $300,000 in new construction work in addition to about $210,000 in improving existing trackage for the growth of the city during the present year. About 5,800 ft. of double track is being laid now for making the connections for the crosstown line. An additional 2,000 ft. of double track is being laid on McLemore Avenue. Another important extension to the system is that of the 5,000 ft. of double track laid along Overton Park Avenue at a cost of approximately $90,000. The company has also constructed about 4,500 ft. of storage track along Front Street. Lead tracks from Main to Front Street were laid for the expeditious handling of cars to and from the storage tracks. This project, completed during the

ELECTRIC RAILWAY MATERIAL PRICES—OCT. 28, 1924

Metals—New York

Copper, electrolytic, cents per lb.	13.55
Lead, cents per lb.	8.65
Nickel, cents per lb.	29.50
Zinc, cents per lb.	6.85
Tin, Straits, cents per lb.	52.75
Aluminum, 98 to 99 per cent, cents per lb.	27.10
Babbitt metal, warehouse, cents per lb.:	
Fair grade	60.00
Commercial	28.00

Bituminous Coal

Smokeless mine run, f.o.b vessel, Hampton Roads	$4.45
Somerset mine run, Boston	2.15
Pittsburgh mine run, Pittsburgh	1.875
Franklin, Ill., screenings, Chicago	1.375
Central, Ill., screenings, Chicago	1.175
Kansas screenings, Kansas City	2.00

Track Materials—Pittsburgh

Standard Bessemer steel rails, gross ton	$43.00
Standard open hearth rails, gross ton	43.00
Railroad spikes, drive, Pittsburgh base, cents per lb.	2.85
Tie plates (flat type), cents per lb.	2.45
Angle bars, cents per lb.	2.75
Rail bolts and nuts, Pittsburgh base, cents per lb.	8.75
Steel bars, cents per lb.	2.00
Ties, white oak, Chicago, 6 in. x 8 in. x 8½ ft.	$1.45

Hardware—Pittsburgh

Wire nails, base per keg	2.75
Sheet iron (28 gage), cents per lb.	3.50
Sheet iron, galvanized (28 gage), cents per lb.	4.60
Galvanized barbed wire, cents per lb.	3.45
Galvanized wire, ordinary, cents per lb.	2.50

Waste—New York

Waste, wool, cents per lb.	15
Waste, cotton (100 lb. bale), cents per lb.:	
White	12–18
Colored	9–14

Paints, Putty and Glass—New York

Linseed oil (5 bbl. lots), per gal	$1.03
White lead (100 lb. keg), cents per lb.	12.00
Turpentine (bbl. lots), per gal.	$0.87
Car window glass (single strength), first three brackets, A quality, discount*	84.0%
Car window glass (single strength), first three brackets, B quality, discount*	86.0%
Car window glass (double strength) all sizes, A quality, discount*	85.0%
Putty, 100 lb. tins, cents per lb.	4–6

*These prices are f.o.b. works, boxing charges extra.

Wire—New York

Copper wire base, cents per lb.	15.625
Rubber-covered wire, No. 14, per 1,000 ft.	$6.25
Weatherproof wire base, cents per lb.	17.75

Paving Materials

Paving stone, granite, 4x8x4, f.o.b.	
Chicago, dressed, per sq.yd.	$3.60
Common, per sq.yd.	2.95
Wood block paving 3½, 16 treatment, N. Y., per sq.yd.	2.67
Paving brick 3½x8½x4, N. Y., per 1,000 in carload lots f.o.b.	$51.00
Crushed stone, ¾-in., carload lots, N. Y., per cu.yd.	1.85
Cement, Chicago consumers' net prices, without bags	2.20
Gravel, ¾-in., cu.yd., f.o.b. N. Y.	2.00
Sand, cu.yd., N. Y.	1.00

Old Metals—New York and Chicago

Heavy copper, cents per lb.	10.75
Light copper, cents per lb.	9.25
Heavy brass, cents per lb.	7.00
Zinc, old scrap, cents per lb.	3.875
Light brass, cents per lb.	5.50
Lead, cents per lb. (heavy)	7.50
Steel car axles, Chicago, net ton	$17.25
Cast iron car wheels, Chicago, gross ton	17.75
Rails (short), Chicago, gross ton	18.25
Rails (relaying), Chicago, gross ton	26.50
Machine turnings, Chicago, gross ton	9.25

early part of the past summer, cost approximately $50,000. The loops on both the north and south ends of the Thomas-Florida line cost approximately $11,000, and the extension of the Florida line 1,900 ft. beyond its former terminus cost $7,000. The company also made numerous repairs on the existing tracks.

Rolling Stock

United Railways & Electric Company, Baltimore, Md., has put several additional one-man cars in operation. They are being used on the Preston and Carolina Streets line and probably will gradually replace the cars now in use on this line. The line has been operated with 15 two-man cars with seating capacity for 44 passengers each. Under the plan being worked out these will be replaced by 20 one-man cars with a seating capacity of 40 each.

Track and Line

Philadelphia, Pa.—Bids were opened on Oct. 21 in the office of Director Ehlers for the second section of the Broad Street subway, 8,600 ft. in length. Patrick McGovern of New York submitted the low bid of $13,485,414, and the prices submitted were found to be about the same proportionately as for the section now under construction between Girard Avenue and Clearfield Street, 10,000 ft. in length.

Terrell, Texas.—Surveys have been made and right-of-way for most of the distance obtained for the proposed interurban electric railway that is to be constructed between Terrell and Tyler, about 60 miles. The projected line is being promoted by Morris Mayfield, Terrell, and associates. The route of the line is through a rich agricultural section, including a number of towns that are now remotely situated from railroad transportation. Along the route are some of the largest deposits of lignite coal to be found in Texas.

Public Service Railway, Newark, N. J., has received permission from the Board of Public Utility Commissioners to relocate a portion of its road in Burlington, N. J., to conform to the proposed change in a section of Pearl Street in that city.

Dallas Railway, Dallas, Tex., will extend its Belmont line four blocks over the Dallas-Denison interurban tracks and will lay a passing switch and turning track. The railway will bear half of the expense, which is estimated at about $4,000.

Miami Beach Electric Company, Miami Beach, Fla., will extend the Flagler Street double-track extension to Twelfth Avenue.

Milwaukee Electric Railway & Light Company, Milwaukee, Wis., has started construction of the extension of the Center Street line, which will cost approximately $100,000. The extension includes 2,440 ft. of double track and 260 ft. of single track. Heat treated cast chrome nickel steel rail, developed and produced under the formula and supervision of the company's engineering department, will be laid.

Market Street Railway, San Francisco, Cal., is reconstructing the track on lower Sutter Street, Third Street and Lincoln Way at a cost of $400,000. This will be followed by the rebuilding of practically the entire San José Avenue line.

Community Traction Company, Toledo, Ohio, has reached an agreement whereby Sylvania Avenue will be paved as soon as possible. The company will install a concrete base into which steel ties will be set.

Buffalo & Erie Railway, Buffalo, N. Y., plans to install an automatic electric block signal system on its line between Buffalo, N. Y., and Erie, Pa.

Pacific Electric Railway, Los Angeles, Cal., has been granted permission to build a short line freight track connecting San Pedro, Wilmington and Long Beach. This is the second step which has been taken recently toward unifying the railroad services of the harbor. Recently the commission granted the Union Pacific System permission to enter the harbor under the consolidated railroad plan. At the intersection of the Union Pacific line and the Pacific Electric tracks an overhead crossing will be built. The expenses will be equally divided. Fourteen street crossings are to be made at grade, the entire expense to be borne by the Pacific Electric. The new line will cost an estimated amount of $163,899.

Power Houses, Shops and Buildings

Memphis Street Railway, Memphis, Tenn., and the Memphis Power & Light Company are having plans prepared for a large reinforced concrete warehouse to be located just north of the present carhouse.

Detroit United Railway, Detroit, Mich., closed down its power houses recently, thereby releasing all of the power house equipment located at Farmington, Monroe, New Baltimore and Rochester, Mich. These four power stations were replaced by 19 1,000-kw. full automatic substations. The company is offering all of these power house equipments for sale. This is in line with the agreement which the company entered into in 1923 with the Consumers Power Company and the Detroit Edison Company for the purchase of all power necessary to operate their 600 miles of city and interurban service.

Trade Notes

Detroit Stoker Company, Detroit, Mich., will show full-sized underfeed stokers in operation at the Mechanical Engineering Power Show, Grand Central Palace, New York City, Dec. 1 to 6, 1924.

Roller-Smith Company, New York, N. Y., announces the appointment of Charles R. Speaker, Evening Star Building, Washington, D. C., as its representative in the District of Columbia. Mr. Speaker will also handle the Roller-Smith Company's government business in the States of Maryland, Virginia, North Carolina and South Carolina.

D. B. Dean, after nearly 25 years service with the J. G. Brill Company, has decided to withdraw from his active duties. With this in view he has resigned as sales manager and director of the G. C. Kuhlman Car Company, to take effect about Nov. 1.

Ohio Brass Company, Mansfield, Ohio, has moved its Philadelphia office from the Witherspoon Building to 1404 Packard Building, Fifteenth and Chestnut Streets.

Nichols-Lintern Company, Cleveland, Ohio, announces the rearrangement of selling territories and appointment of the following sales representatives: A. C. Burleigh, Boston, Mass.; Pharo Engineering Company, Pittsburgh, Pa.; Jameson-Ross Company, Chicago, Ill.; F. F. Bodler, San Francisco, Cal., and A. W. Arlin, Los Angeles, Cal.

New Advertising Literature

Electric Machinery Manufacturing Company, Minneapolis, Minn., has issued bulletin No. 854 describing, with illustrations, synchronous motors for compressors.

General Electric Company, Schenectady, N. Y., has issued a 12-page booklet bearing the designation Y-2019, describing the new type A General Electric welding electrode. Details are given on electrode construction and characteristics. Results of tests on welded cast iron specimens and deposited metal specimens are described, and oscillograms demonstrating arc stability are reproduced. Instructions for use of the electrode are supplied and specifications of the standard sizes given.

The Travelers Insurance Company, Hartford, Conn., has issued a 25-page booklet on the value of group insurance. The pamphlet gives the history of group insurance, some facts about those it serves and enumerates its many rewards. How the field service men on the Travelers Insurance serve the 2,400 corporations and firms on the list of group policyholders is included in the story. The value of group insurance is summarized thus: "Group insurance benefits him who gives and him who receives! You will never cease to be gratified with its adoption."

Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., has issued special publication 1707, Westinghouse Railroad Data. This pamphlet contains definite information on electrical applications on steam railroads.

Wagner Electric Corporation, St. Louis, Mo., has issued Bulletin No. 140, on power transformers.

Crouse-Hinds Company, Syracuse, N. Y., has issued folder No. 18 on "Imperial Floodlights and Projectors" and folder No. 19 entitled "A New Highway Law."

Now We Can Go Ahead Confidently

THE election of President Coolidge will be generally acceptable to electric railway men. On several occasions the President has shown his interest in the welfare of the electric railway industry, and while vice-president he was one of the speakers at the 1923 Midyear Meeting in Washington. But it is not only as a personal matter that President Coolidge's success at the polls may be welcomed. The hearty indorsement given to his policies in the election by the country at large shows that the majority of the people are conservative and have not been misled by the radical arguments of recent years.

It should not be forgotten that government ownership and operation of railways and other public utilities was one of the policies advocated by the party which carried but one state at the election on Tuesday. It also must not be forgotten that a most convincing reply to this policy of government ownership was broadcasted from Washington about five weeks before the election by Secretary of Commerce Hoover and published in full at the time in ELECTRIC RAILWAY JOURNAL. It must not be forgotten that the decisive defeat of Mr. La Follette also removes all cause to fear that the United States Supreme Court may be made subservient to the Congress.

Not the least of the good results of the election is the probability that we shall continue to have the services in high office of such men as Hoover and Mellon. This insures another four years of "more business in government and less government in business."

Altogether Mr. Coolidge's election and Mr. La Follette's thorough defeat means that we can go ahead with the business of public service, having full confidence that the rights of property will be inviolate and that honest private operation will not be menaced and strangled by a drive for socialism. The country has spoken unmistakably. It does not want any change in our form of government. It does not want socialism.

More Attention to Tiring Will Save on Re-Tiring

IT SEEMS to be a very general condition now that the purchaser of motor buses gives little if any consideration to the size and type of tires with which the new vehicles are to be equipped. Likewise, the chassis manufacturer is not too particular about what he puts on, in the absence of definite specifications. This leads to much dissatisfaction with the tires and produces high operating costs, for the tire item is one of the principal expenses in motor bus operation.

The manufacturer of tires is particularly interested in this situation, for he realizes that if a wrong size and type of his tires are placed on a bus the user is likely to feel that he had better choose a different make when he has to re-tire. One prominent tire engineer found pleasure at the number of tires of his own make with which buses at the Atlantic City convention were equipped, but was greatly disappointed at the fact that on many of these buses either the wrong size or the wrong type of his tire had been applied.

Tire manufacturers say that they have been unable thus far to arouse sufficient interest in this detail of equipment. This is naturally a condition which accompanies the newness of the use of buses. Tire manufacturers also say that their offers of advice by engineers who have made tire manufacture their life work have not been at all well received by bus operators. The latter have looked upon all such proffers of service as being merely sales schemes. While such an engineering service is, of course, an indirect approach to the later sale of tires, it is difficult to see why railway men should not accept the engineering services of these firms, just as they have learned to rely upon the engineering services of the manufacturers of railway equipment. Perhaps the tire manufacturers must go through a certain period of effort in establishing confidence, but surely the question of getting the proper tires on a bus is a matter of considerable importance.

Street Railway Not Inherently Faulty in New York Situation

WITH the many applicants fighting to obtain franchises for bus operation in New York City, the situation of the street railways is commonly looked upon as hopeless. Perhaps the situation is hopeless—if present politics and present operating methods are to continue. But this is so only if these conditions do continue, and not because of any inherent weakness in the electric rail system as compared to any newer form of transportation now available.

New York City street railway operation, excluding Brooklyn lines, does not represent modern railway practice. The equipment in use is old and inherently slow. Even this old equipment is not operated as well or as rapidly as it could be. With their lackadaisical running and discourtesy, Manhattan trainmen have inspired much adverse criticism of the street car. They have given some cause for the idea prevalent that it is a back number.

A brief analysis on page 806 shows some of the troubles of the street railways in New York. One is that the speed of cars averages only 7.16 m.p.h. In Chicago the street cars are averaging nearly 11 m.p.h. That high figure cannot be attained in Manhattan, but it is believed that 8 to 8.5 m.p.h. would be possible with modern cars designed for rapid loading and unloading and fast acceleration, and manned by well-schooled and disciplined trainmen. This would mean not only a large saving in operating expenses but would attract great numbers of short-haul riders who now make nearly as good time walking. The demand for street car service is certainly not lacking, as is evidenced by the high average car-mile earnings in Manhattan, which are about 70 cents as compared with 45 cents for the country as a whole. In fact, today, as pointed out in the annual report of one of the railways, page 822, the New York surface lines are carrying a larger proportion of the total number of passengers carried on surface, elevated and subway lines than at any time since the subways started. The use of street cars in recent years has increased faster than the use of subway and elevated lines.

Another of the troubles is that the street cars have average receipts of only 3.5 cents per passenger-mile, while the buses, both Fifth Avenue and municipal, get some 5.5 cents per passenger-mile. Were the Manhattan and Bronx railways receiving the same revenue per passenger-mile as the buses, which would be equivalent to an 8-cent fare, their receipts would be increased 57 per cent. Their net earnings would go up from $3,489,000 to $19,800,000. This would give a return of 22 per cent on their valuation after meeting taxes, even under the present low rate of speed, instead of the present actual return of 3.9 per cent.

In other words, if the street railways were to earn only a return of say 8 per cent, the service could be supplied at a revenue per passenger-mile considerably below that of the buses, even under present conditions. With the system thoroughly modernized, the advantage of the railway would be still greater. It might even be possible with the heavy traffic density in New York City that a 5-cent fare would suffice.

These considerations would not seem to indicate any inherent weakness in the street railway.

The present low speed of the cars is of course not entirely the fault of the cars and operating methods. Traffic regulation in New York City is not designed to assist street car movement. Parking regulations and their enforcement are lax. It is not unusual to see automobiles standing in double lines along the curb and forcing all moving vehicles onto the car tracks. Left-hand turns are allowed practically everywhere. Vehicles may turn around in the middle of the block, bringing all other traffic to a standstill. Much time is lost on account of the lack of flexibility of the interlocked traffic signal lights used on main thoroughfares. In short, traffic regulation in New York is probably the worst in any large city in the United States, from the street railway standpoint.

Part of, the remedy for the railway situation is managerial in nature; the remainder is political. If the two interested parties will come honestly to the common purpose of providing good surface transportation for the citizens of New York City, the situation can be solved. The JOURNAL believes there is a way to work it out if progressiveness and co-operation on both sides can be brought about.

The fact that the existing system of surface transportation is not efficient is no reason to replace it by a system which is inherently unsuited to the conditions. The present situation is largely the fault of the public, which for years has allowed the politicians to hamstring the railways upon every occasion. In the interest of good transportation it would be better to increase the efficiency of the street railway system than to allow public clamor to drive these companies into the operation of buses under conditions for which they are not fitted. Above all, it would be a grave mistake to allow a matter of this kind to be decided by fancy or sentiment instead of by cold, hard facts.

There is plenty of field in New York for the bus—to supplement the railways, but not to displace them.

Akron Voters Wisely Approve Fare Increase and New Short-Term Franchise

NEWS deeply significant comes out of Akron, Ohio. At the election in that city on Nov. 4 the voters approved an ordinance under which co-ordinated railway and bus service will be continued. The term of the new franchise is only 4 years, which period, it is expected, will furnish a reliable guide to future normal prices and transportation costs. Neither the company nor the city thought it advisable to enter into a long-term contract at this time. Under the terms of the temporary ordinance which has been in effect since last February, when the company's franchise expired, the company would have had no right to operate after May 1, 1925. It would be idle to speculate upon the consequences which might have followed a rejection of the settlement proposal at the polls. Akron had no such thought. The size of the vote in favor of the new grant proves that.

It is only last February that Akron appeared to be determined to exact its pound of flesh from its railway. Since then, however, the thought of its experience without service has had its effect. Long ago Akron could have had all that is in prospect for it now without the turmoil that attended the suspension of railway and bus service there for a period of thirty days, but Akron was misled, badly misled. It knows that now.

The provisions of the new grant under which the joint bus and railway service will be operated for the next four years give great promise for the future. On the basis of the public inquiry which fixed the "bare" cost of carrying a passenger in 1923 at 5.55 cents, the company is assured a living wage, as the new fare will give a minimum revenue per passenger of 5.88 cents, this coming from the frequent riders who take advantage of the lowest rate of 17 tickets for $1. The city is protected with respect to the conditions under which it can exercise the right to purchase the entire property. And the public is assured adequate service by car and bus at a low rate of fare.

The attitude of the city officials and the public press during the period incident to the campaign in behalf of the new settlement proposal was certainly in striking contrast to the sentiment expressed previous to the withdrawal of service last February. Critics of the Akron company there have been and probably always will be. This is the fate of any public enterprise. But there is no satisfactory answer to the argument of the company itself in behalf of the new grant. In effect, that statement was that it must be apparent to everyone that unless the company does supply good service in the next four years, it cannot hope to have the public good will necessary to continue to operate the system beyond the present contract period.

Supervisory Controlled Substation on Chicago Elevated

New Substation at Junction with North Shore Line Controlled by Power Supervisor in General Offices in Edison Building—2,000-Kw. Machine Has Full Automatic Features—Building Located in Residential Section, Necessitating Artistic Design

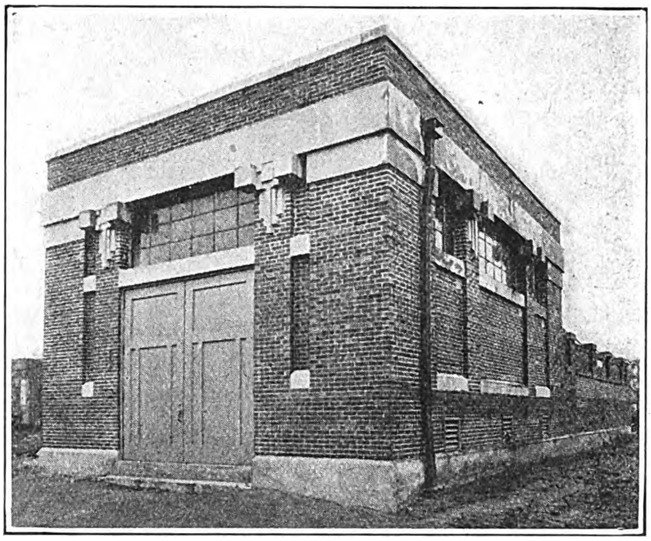
By Dwight L. Smith
Assistant Electrical Engineer Chicago Rapid Transit Company

EXTENSIVE developments in supervisory control led the Chicago Rapid Transit Company to adopt this system in conjunction with its new automatic substation at Central Street, Evanston. This automatic substation is located near Linden Avenue, Wilmette, which is the junction of the Chicago Rapid Transit system with the Chicago, North Shore & Milwaukee Railroad, as well as being the location of a large storage yard. The substation at present includes one 2,000-kw. rotary converter, housed with switchboard and control in a building 25 ft. x 34 ft., and 16 ft. high inside. Oil switches, disconnects, and power and control transformers are located in an adjacent outdoor court. Sufficient ground space is available for the erection of the second building to house an equal additional capacity and for duplicate outdoor equipment. The station is full automatic with all modern protective devices, including two steps of loading limiting resistance for the machine, and has three automatic reclosing feeder panels for the control of two feeder sections for the Chicago Elevated and one for the North Shore Line, as well as a feeder panel for the Evanston Railway.

As the desired location for a station was within the exclusive North Shore residential district, it was located on the property of the Evanston Railway, where the latter already had a carhouse. Even three sides of this location faced directly on properties zoned for residences. On the fourth side, a golf course and a proposed boulevard along the North Shore drainage channel came between the substation and the right-of-way. To make the station fit these surroundings and conditions, the building was constructed of face brick, trimmed with artificial stone, matching the car station building. The outdoor equipment is inclosed on the street side with a neat face brick wall of similar design.

TRANSMITTING THE PURCHASED POWER

The 60-cycle, three-phase, 12,000-volt energy is obtained from the Commonwealth Edison Company at the point where its transmission lines approach the station. It is carried to the station by a No. 00 transmission line built and owned by the Chicago Rapid Transit Company along its right-of-way. Not only was it desirable for the sake of appearance, but since the golf course and boulevard mentioned lay between the station and the railway right-of-way, it was necessary to bring all feeders and the transmission line into the station underground. A 16-duct line was built from a manhole on the right-of-way to a manhole in the street in front of the station. From this latter manhole ducts carry the high-tension cable to the steel structure in the outdoor court, the positive feeders into the switchboard pit and the negative feeders directly into the machine pit. The telephone cable, containing the telephone and supervisory control lines, also comes through this duct line.



Central Street Automatic Substation of the Chicago Rapid Transit Company, in Which the Supervisory Equipment Is Installed

At the right-of-way, laterals extend from the manhole up a structure built between two poles 10 ft. apart. The cables extend up these laterals to disconnect switches at the top and thence to the various feeders and the transmission line. A grounding switch is mounted in the high-tension line at this point. All switches are locked and are available only from a platform 25 ft. high mounted between the two poles. The negative feeders run directly from the manhole on the right-of-way to the track rails.

The high-tension cable terminates in a pothead mounted on a steel structure in the outdoor court of the substation. This structure serves as a support for the disconnect switches, fused disconnects for the operating transformer and the choke coils. The type KO-36 oil circuit breaker is mounted next to this structure, with the current transformers between the oil circuit breaker and the power transformers. The latter are 700-kva. each, oil insulated and self-cooling. All transformers have 12,000-33,000-volt primary windings, and the transmission line and all high-tension wiring is insulated for the higher voltage. The outdoor apparatus is elevated on steel structures of sufficient height to place all live parts more than 10 ft. above the concrete floor of the court. The entire court is inclosed by a wire fence.

Inside the building the switchboard occupies the end of the building near the court, with the load-limiting resistances on the floor level behind the switchboard.

The contactors, high-speed circuit breakers and field rheostat are mounted on a structure above the switchboard. Slate runways are in front and behind the contactors and breakers. The converter is at the other end of the building near one side, leaving room beside it for the telephone booth, air compressor, steel workbench and steel lockers for tools, spare parts and supplies.

Connections from the low-tension side of the transformers are made by paper-insulated, lead-covered cables, which come into the station through wall bushings, thence down ducts leading directly to the converter pit and the pit in the rear of the starting panel. The d.c. connections from the rotary to the switchboard are made in a similar manner. Vertical legs from the starting panel and the a.c. rings on the machine are made with copper bus to which the cables are attached in the pits. A pit 26 in. wide and 24 in. deep runs the entire length of the switchboard in its rear and serves as a handhole for terminating these cables as well as all control wiring conduits, and as a runway for all control wiring. The pit has a removable slate cover, thus all wiring is neatly concealed but easily accessible.

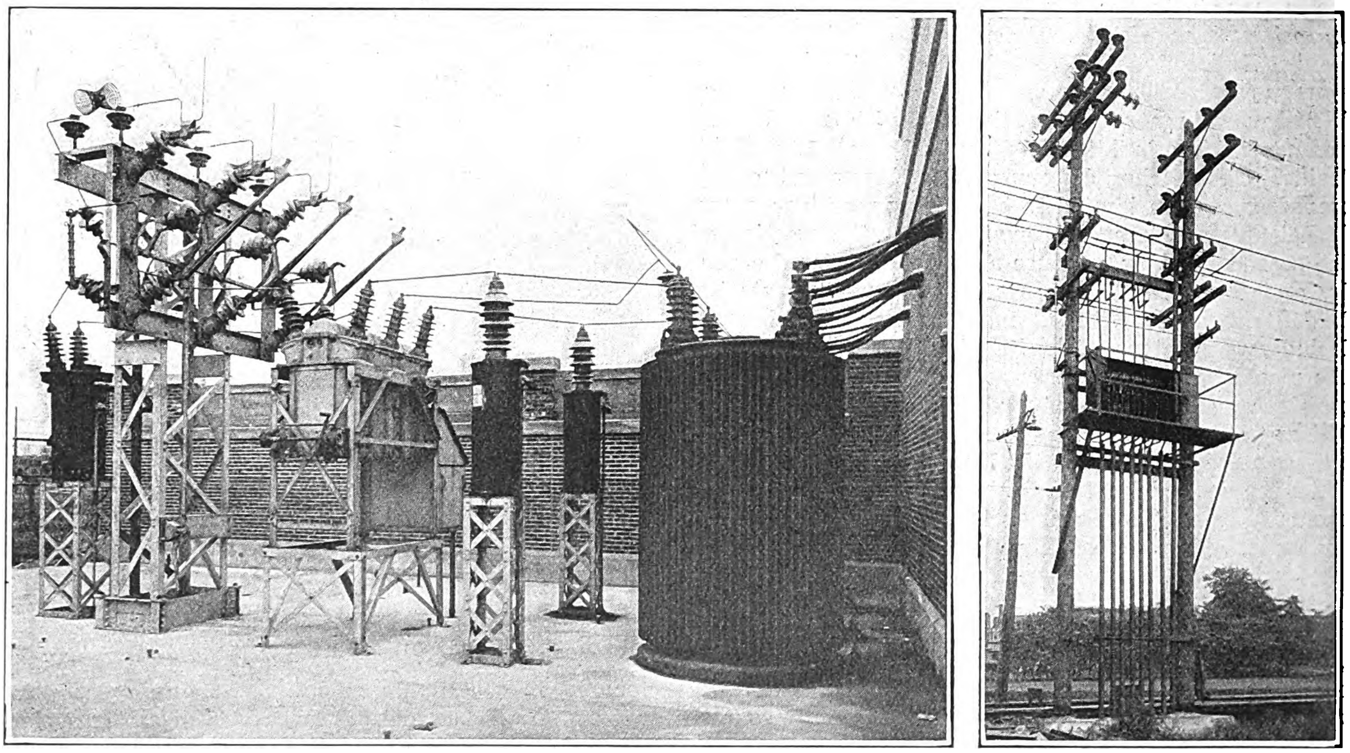
In addition to the automatic features, a supervisory control system connects the station with the power supervisor's office, 15 miles distant in the main offices of the company located in the Edison Building, Chicago. This system provides means for the supervisor to lock out or release the machine and to open or close any feeder at will. It also gives an automatic indication by red or green lamps on the supervisor's board whether the machine is running or shut down and the feeders open or closed. This indication takes place whether the action has been performed by the supervisor or automatically.

The supervisory control system consists essentially of standard telephone selector equipment with sending and receiving features at both the power supervisor's office and the substations. It operates over three wires, No. 22 gage in the railroad company's telephone cable. For sending the supervisor has manually operated selector keys, one to open and one to close each controlled apparatus. These keys actuate pole-changing relays according to a predetermined code setting, notching up the selector having the same code setting at the substation. The substation selector operates an auxiliary relay through whose contacts the control circuit of the apparatus is looped. The opening of the auxiliary relay opens the control circuit and disconnects the apparatus, while the closing of the auxiliary relay completes the control circuit and permits the apparatus to function automatically.

The return indication is initiated by interlocks on the apparatus controlled. A change in the position of the apparatus actuates a motor selector key in the substation, operating a selector in the office and lighting the proper indicator lamp. Only one-half the number of selectors are used in the office as at the substation. As an additional protection insuring proper indication, the polarity sequence of the code for indicating the open position of any one piece of apparatus is reversed for indicating the closed position. The indication itself is finally obtained by the action of a polarized relay which indicates according to the polarity of the last impulse of the code received.

A control shelf at the power supervisor's office holds the pole-changing relay which furnishes the impulses to the selectors at either end, relays for the pilot lamps and buzzer indications to the supervisor of changes in indications and locking relays preventing the mixing up of outgoing and incoming impulses. This apparatus is mounted in a steel cabinet.

At the substation end there are mounted in a similar cabinet the selectors and motor-driven selector keys,



At Left, All High-Tension Apparatus Is Located in an Adjacent Outdoor Court, Inclosed by a Brick Wall and Wire Fence. At Right, Laterals and Switches Connect the Duct Line from the Substation with the Overhead at the Railway Right-of-Way

the ordinary telephone system and waiting for their report back, the switching and indication is accomplished instantaneously. Although not done in this case, as ample telephone cable facilities are available, it is possible to utilize the control wires for the operation of telephones as well.

The automatic reclosing feeder equipment consists of a high-speed circuit breaker with control circuits and relays which provide protection for both the machine and the feeder section itself. The high-speed breaker with "trip free" feature has been entirely successful in protecting the rotary converter from flashovers. Tests made by short-circuiting a feeder just outside the substation have opened the circuit breaker without so much as producing a "squeal" on the converter. The control circuit relays provide for taking the control current from either the bus or the feeder, whichever has the higher voltage. The breaker will remain closed as long as the potential on either side is 250 volts or above, thus providing for feeding either out from the substation, or when the station is shut down for feeding through the station bus.

General Schematic Wiring Diagram of Station and Supervisory Control

Thermal relays in the feeder busbar provide for opening the breaker when the bus becomes overheated, reclosing again when the temperature decreases. This feature, however, is unnecessary as the installation is designed to carry maximum useful loads while the high-speed breaker will care for short-circuit conditions. This breaker has a reclosing coil and a holding coil which holds the breaker closed. A bucking bar paralleled by an inductive shunt, in series with the load, produces a field opposed to that of the holding coils. When the field produced by the bucking bar becomes greater than that of the holding coil, the breaker is opened by a spring. The field of the bucking bar varies with the rate of increase of the load, a slow increase permitting a greater portion of the current to go through the inductive shunt than a rapid increase. Thus the breaker will open on a lower current produced by a short circuit with its rapid current rise than where the current is taken for ordinary uses with a comparatively slower rate of increase.

When the breaker is opened automatically a time delay relay starts. It completes its action in 15 seconds, closing a small feeling-out contactor which completes the feeder circuit through a load indicating resistance, in series with which is a current transformer. If the short circuit still exists the rush of heavy current through this transformer trips a relay which opens the small contactor and starts the whole cycle over again. At the same time the small contactor closes, an auxiliary time delay closing relay starts to close, its action taking long enough so that if the tripping relay operates it will be restored and again start its action at the proper place in the cycle. This action will be repeated until the short-circuit condition is removed and the current through the small contactor, resistance and current transformer is small enough to prevent a kick which will open the tripping relay. If the tripping relay does not operate, the auxiliary closing relay completes its action and closes the high-speed breaker. Variation of the current setting at which the breaker will trip is obtained by varying the reluctance of the magnetic circuit of the holding coil.

The apparatus is provided with disconnects on each side of the circuit breaker and thus can be isolated for inspection or maintenance. Although the main contacts of the circuit breaker are comparatively small for the current rating, no trouble has been experienced with them. The breaker is opened manually by a knife switch in the control circuit. The supervisory control operating relay contacts are in series with this same circuit.

All this apparatus and the station equipment were furnished by the General Electric Company.

Ventilation inside the station is natural through louvers placed low on the walls and four 3-ft. diameter ventilators in the roof. Two ducts lead from outside the station directly into the converter pit. On warm days the temperature inside the station rises well over 100 deg. F., but it was not felt that sufficient decrease in this temperature could be obtained by forced ventilation to warrant its use, and several protective relays have been redesigned to withstand these temperatures. The station is well lighted both inside and out, with an emergency throw-over switch so that the lights can be thrown onto any of the feeders entering the station.

The number of customers supplied from this one station has necessitated a complicated metering arrangement, but hourly reading printometers record accurate information not only of the daily output but of the hourly output, which is necessary for determining the maximum demand.

The station normally runs from 6 a.m. to 1 a.m. and during this time the load is such that it never shuts down from lack of load. During the other five hours of the day it is locked out by the power supervisor.

On the daily inspection, which takes one to two hours, printometer tapes are changed, meters and apparatus counters read, supervisory control lines are tested and a casual inspection is given to the apparatus. Once a week the maintainer makes a night inspection, which gives 5 hours during which the station is shut down for careful inspection and any work not possible while it is running. A daily report is made to the office, and by means of apparatus counter readings, voltmeter charts and meter readings a very accurate account is available of the operation of the station.

Automatic Rear Exit Doors on Toronto Rebuilt Cars

Sixty Former Two-Man Cars Are Being Arranged for One-Man Operation by Installation of Automatic Doors at Rear—Passengers Will Enter at Front End Only, but May Leave at Either End

AS PART of a general program of remodeling 351 cars taken over from the Toronto Railway in 1921, the Toronto Transportation Commission is now converting 60 of these cars for one-man operation, utilizing a front entrance and exit in combination with a rear exit controlled by an automatic exit door. In the arrangement of the car and the door control a number of interesting features are included, some original with the Toronto installation and others adapted from designs in use elsewhere.

The automatic rear exit feature is patterned after the design which has been found successful on a sample car operated by the Washington Railway & Electric Company and which was described in the ELECTRIC RAILWAY JOURNAL of Aug. 30. In the case of the Washington car, however, the treadle arrangement is installed on each platform of a double-end car, so as to be used as a rear exit regardless of the direction of motion, while the new Toronto cars will be single end, and only one treadle per car will be necessary.

Originally equipped with longitudinal seats, these cars are only 8 ft. ½ in. wide over the side posts. They are now being equipped with cross-seats on one side, giving an aisle width of 2 ft. 8¾ in., so as to encourage passengers to move toward the rear end instead of blocking the space at the front end of the body near the entrance door. The seating arrangement adopted, together with circular seats at the rear end, gives a total seating capacity of 51.

At the front end, a passageway for both entrance and exit is provided. The entrance door is pneumatically controlled from the brake valve, while the exit door at this end is manually operated by means of an auxiliary control provided for the purpose. The arrangement is such, however, that when the entrance door has been opened, it will in closing also close the front exit door if the latter is open at the time.

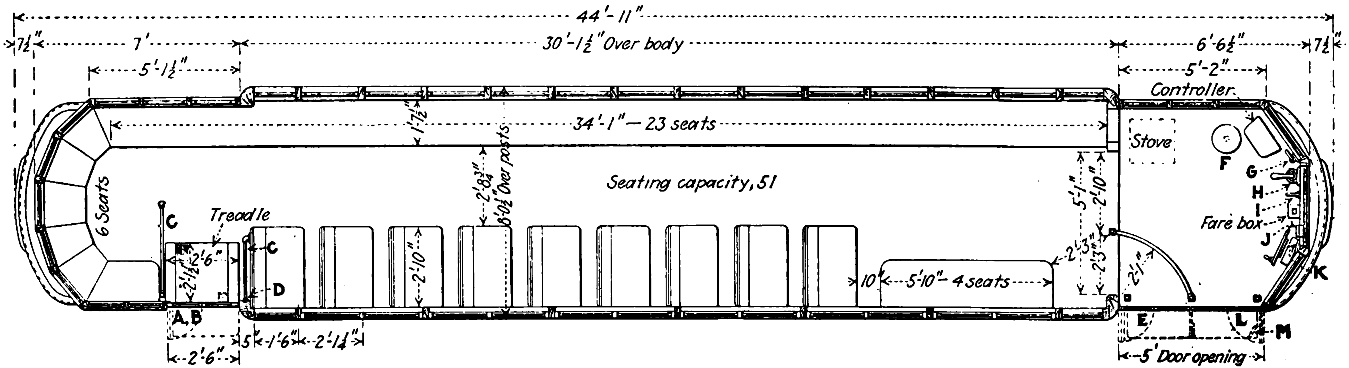
Control of the door engines is obtained from the brake valve. Two door-opening notches on the segment of this valve give a selective control between the front door and the rear treadle-operated exit. In other words, when the valve handle is set to the first door-opening notch, the rear exit door will open provided there is a passenger on the treadle, or this will occur whenever a passenger steps on the treadle while the valve remains in the same position. If the handle is moved to the second door-opening notch, the action of the rear door will be exactly the same, but in addition the front door will be opened. Under both settings of the handle, the rear door closes automatically as soon as the alighting passenger has cleared the step. Thus the rear door is automatically closed to prevent passengers entering at that point, and this also prevents the door from remaining open in cold or inclement weather any longer than is necessary to allow passengers to leave the car.

DOOR ACTION SUPERVISED BY MOTORMAN

When the brake valve handle is returned to the release position the rear exit door does not close until alighting passengers have entirely cleared the exit step. When the step is clear the door then automatically closes. An additional safety feature is provided in the form of a small auxiliary control valve adjacent to the brake valve, which enables the operator either to lock the rear door against the action of the treadle when the front door is opened, or to open the rear door directly, if this becomes necessary for any reason when no passenger is on the treadle.

Mirrors are arranged at the front end of the car to enable the operator to see both the interior of the car back of him and the rear exit step, without turning around. Extra lights installed over the rear door are lit only when the door is open. At the front end a standard door interlock signal lamp is installed, and in addition an auxiliary red lamp is lit when the rear door is open.

Both the pneumatic door equipment and the automatic treadle device are being furnished by the National Pneumatic Company. The rear platform of the car is flush with the body floor, but the rear exit treadle is set down 9½ in. so that an alighting passenger steps down to the treadle and then to the exit step.



Automatic Rear Exit One-Man Car for Toronto

Passengers board at the front end, and leave either at that end or at the rear through an automatic rear exit door. Selective door control is obtained from the brake valve, and mirrors and signal lights are arranged so as to give the operator a view of the rear step.

A—Rear exit door is controlled by treadle. It is operative only when the air-brake valve is in "door open" position.

B—Extra lights installed over rear door are operated by the treadle, lighting when the door is open and being extinguished when the door is closed.

C—Rear exit grab rail.

D—Push button for use of passengers standing on or near treadle.

E—Front exit doors are operated both ways manually, but will close pneumatically with entrance doors when the latter have been open.

F—Motorman's removable seat in socket.

G—Manual handle for operating front exit door.

H—Brake and pneumatic door control.

I—Valve to open or lock rear exit door independent of treadle.

J—Signal lamps. Upper, standard door interlock signal lamps. Lower, red lamp, lighting when read door is open, and extinguishing when door is closed.

K—Mirror for observation of interior movement.

L—Front pair of doors fully pneumatically operated from brake valve.

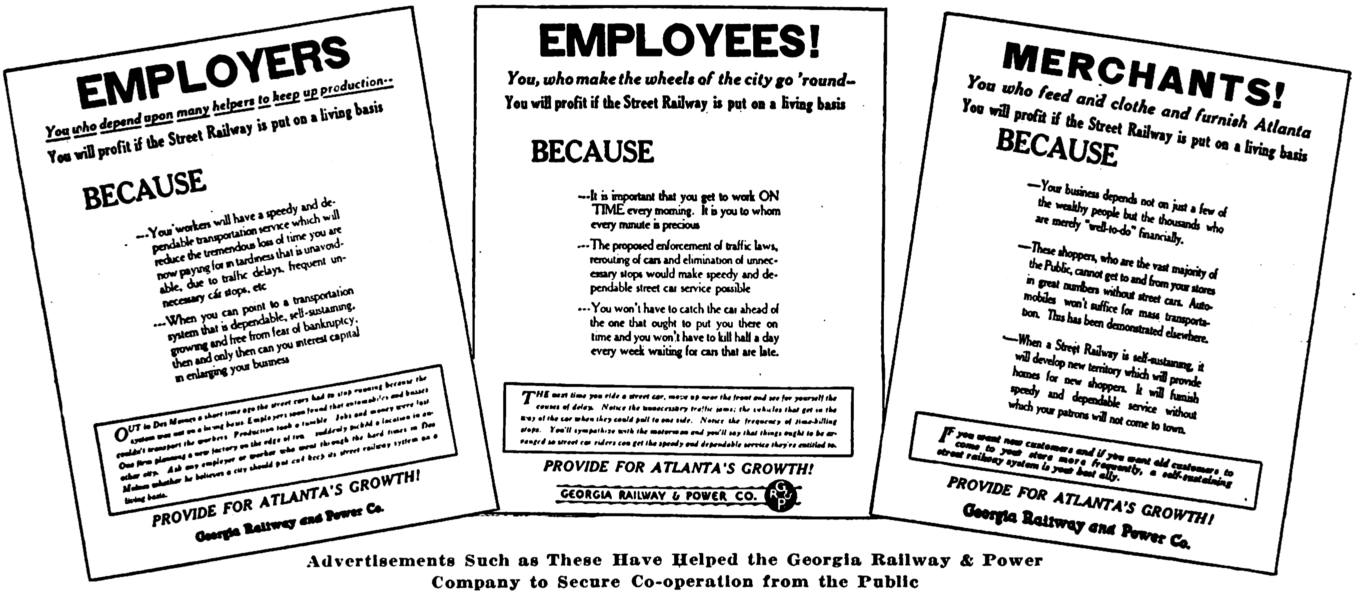
M—Mirror for observing rear step.

Changing Knockers Into Boosters

Skillfully Conducted Publicity Campaign of Georgia Railway & Power Company Has Been an Important Factor in Influencing Public Opinion

THAT it pays to advertise public utilities as well as other lines of business has been effectively demonstrated during the past year or two by the Georgia Railway & Power Company, Atlanta, Ga. Only a few years ago the company was spending comparatively little money in newspaper advertising, but an indication of its changed policy is seen in the fact that its new business advertising for this year will amount to more than $50,000.

This company is one of three in the South to conduct a public relations department. The department uses various means for accomplishing its end—advertising, speakers, car cards, billboards, and a street-car publication distributed from "take one" boxes. The work of the department has proved profitable beyond all expectation in building up good will in the territory served.



EMPLOYERS

You who depend upon many helpers to keep up production--

You will profit if the Street Railway is put on a living basis

BECAUSE

---Your workers will have a speedy and dependable transportation service which will reduce the tremendous loss of time you are now paying for in tardiness that is unavoidable, due to traffic delays, frequent unnecessary car stops, etc

---When you can point to a transportation system that is dependable, self-sustaining, growing and free from fear of bankruptcy, then and only then can you interest capital in enlarging your business

OUT in Des Moines a short time ago the street cars had to stop running because the system was not on a living basis. Employers soon found that automobiles and busses couldn't transport the workers. Production took a tumble. Jobs and money were lost. One firm planning a new factory on the edge of town suddenly decided on a location in another city. Ask any employer or worker who went through the hard times in Des Moines whether he believes a city should put and keep its street railway system on a living basis.

PROVIDE FOR ATLANTA'S GROWTH!

Georgia Railway and Power Co.

EMPLOYEES!

You, who make the wheels of the city go 'round--

You will profit if the Street Railway is put on a living basis

BECAUSE

---It is important that you get to work ON TIME every morning. It is you to whom every minute is precious

---The proposed enforcement of traffic laws, rerouting of cars and elimination of unnecessary stops would make speedy and dependable street car service possible

---You won't have to catch the car ahead of the one that ought to put you there on time and you won't have to kill half a day every week waiting for cars that are late.

THE next time you ride a street car, move up near the front and see for yourself the causes of delay. Notice the unnecessary traffic jams; the vehicles that get in the way of the car when they could pull to one side. Notice the frequency of time-killing stops. You'll sympathize with the motorman and you'll say that things ought to be arranged so street car riders can get the speedy and dependable service they're entitled to.

PROVIDE FOR ATLANTA'S GROWTH!

GEORGIA RAILWAY & POWER CO.

MERCHANTS!

You who feed and clothe and furnish Atlanta

You will profit if the Street Railway is put on a living basis

BECAUSE

—Your business depends not on just a few of the wealthy people but the thousands who are merely "well-to-do" financially.

—These shoppers, who are the vast majority of the Public, cannot get to and from your stores in great numbers without street cars. Automobiles won't suffice for mass transportation. This has been demonstrated elsewhere.

—When a Street Railway is self-sustaining, it will develop new territory which will provide homes for new shoppers. It will furnish speedy and dependable service without which your patrons will not come to town.

IF you want new customers and if you want old customers to come to your store more frequently, a self-sustaining street railway system is your best ally.

PROVIDE FOR ATLANTA'S GROWTH!

Georgia Railway and Power Co.

Advertisements Such as These Have Helped the Georgia Railway & Power Company to Secure Co-operation from the Public

Soon after it was decided to organize a public relations department, an extensive publicity campaign was launched. One of the first steps was the issuance of a little four-page pamphlet called "Two Bells," published weekly and distributed on the street cars. Considerable advertising space in the daily newspapers was used and the message was further "got over" to the public by the use of dash signs and inside car cards. Another publication is a window card changed weekly, known as "The Empire State," and setting forth the things for which Georgia, the so-called "Empire State of the South," is most famous. The matter used is wholly of an educational nature, unmixed with propaganda of any sort, and the card quickly became popular over the whole state. Its slogan, "It's Great to Be a Georgian," has been taken up by other organizations in the company's territory. As for "Two Bells," it is a breezy little paper, 5½ in. x 8½ in., set two columns to the page. Each issue contains quips and messages ingeniously and palatably mixed. The running heads are used to remind readers to "Use Street Car Tickets and Help Speed Traffic," to "Obey Traffic Laws" and to convey similar admonitions.

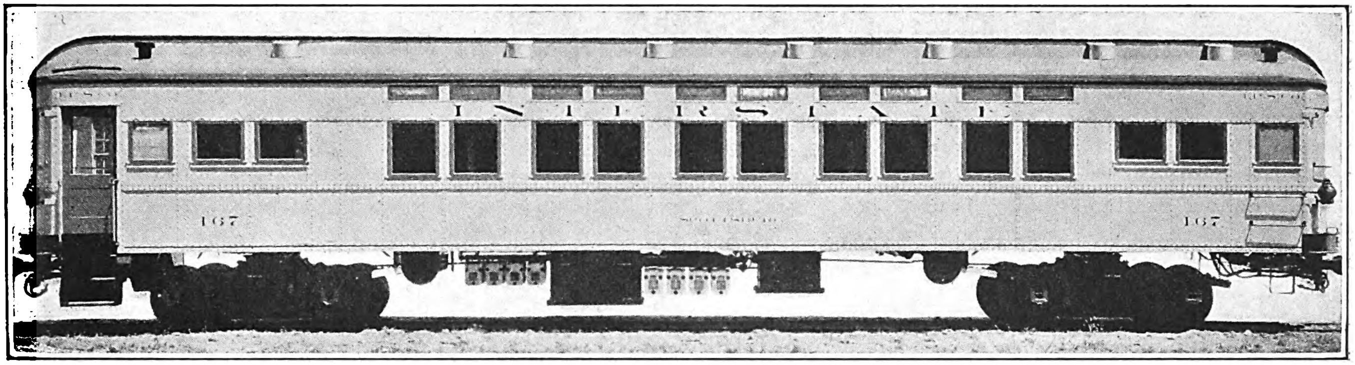
The department also issues a monthly company publication, "Snap Shots," which stands in the front rank of utility publications throughout the country. Still another publication, "The Ally of the Home," containing information about the appliances sold by the company useful to housewives, is published monthly and sent out with the monthly bills. All the publications are printed in the company's own plant, as are most of the forms and other printed matter used by the company. This plant is operated under the direction of the public relations department and effects a large saving yearly over the old method of sending out all printing jobs.

ROMANCE OF POWER DEPICTED

A series of posters of an educational nature on the subject "What Is Power?" was prepared some time ago and placed in conspicuous places in all of the city cars and interurban cars operated by the company. The information in the posters is the result of original research work done by engineers of the company. It depicts the romance of power and traces the development from the days of prehistoric man to the present time. The posters were all copyrighted by the company. The complete story was told through a series of twelve brief lectures, running one each week.

Under the direction of the public relations department the company also ties in with community affairs by using its dash sign space for good-will advertising of local events, church and other charitable affairs. It has organized a quartet, whose services are free for such affairs. This has proved a valuable instrument in building up good will for the company.

Through the work of the public relations department, the car riding public and also the patrons of the other departments of the company have come to have a better idea of the problems and perplexities of operating a public utility. They have learned that the company really has little voice in the matter of the rates charged for street car rides, for gas and electric service. They have learned that the company is in the business of selling service and that in addition to that the company is willing and anxious to be identified with the community life of the city.



One of Three 62-Ft., 10-Section Sleeping Cars Recently Placed in Service Between Louisville and Indianapolis

Sleeping Car Service Begun by Interstate Public Service Company

Extra Long Berths, with Windows Alongside Uppers; Large Washrooms and Easy Riding Qualities Are Features of Three Sleeping Cars Recently Placed in Service Between Indianapolis and Louisville—They Are Operated on a Slow Schedule with a Layover Before Entering Terminal—This New Equipment Cost $100,000

ELECTRIC railway transportation between Indianapolis and Louisville was advanced another step when the Interstate Public Service Company began the operation of sleeping cars. To furnish this service, three all-steel 10-section sleepers were designed by the company. These cars embody the latest ideas to be found in steam railroad equipment of the same type. In addition they have several new features. In spite of limitations as to length, truck size, width and overhang the cars have been arranged so that the available space is utilized to such advantage that greater convenience and comfort is afforded than is found in a standard Pullman sleeper. These cars are not motorized. They were built by the American Car & Foundry Company. The three cost approximately $100,000.

The car is 62 ft. long and 8 ft. 8½ in. wide, with a total weight of 50 tons. It is mounted on Baldwin interurban-type, four-wheel trailer trucks with special elliptic and coil springs to secure riding comfort. Rolled-steel wheels of 34-in. diameter and having 3½-in. A.E.R.E.A. tread are used. The Tomlinson M.C.B. automatic radial couplers at either end have G.E. 10-wire coupler plugs which carry the train control line, a 600-volt lighting circuit and a signal system. Air connections at both ends of the car provide for brakes and a service supply.

As most of the lamps within the car require a 32-volt current, an Edison 24-cell, 300-amp.-hr. battery of that voltage is carried under the car. To charge this battery a motor-generator set has been installed instead of the resistor grids originally provided. This machine operates from the 600-volt trolley circuit, being supplied with power through the car-to-car jumper or by means of a pole hooked on the trolley wire when the car is standing at a terminal. The set is cut in and out by means of a relay actuated by a reversible watt-hour meter mounted on the switch panel. Two electric heaters located under the car and controlled by a thermostat supply hot water to the washrooms. These heaters have 5-gal. copper tanks surrounded by heating coils and asbestos packing. The coils receive energy from the 600-volt circuit.

The car has steps on both sides but only at the front end. It is to this end that the motor car is coupled. Although an end vestibule door has been provided at the rear, it is necessary to pass through the men's dressing room in order to leave the car at that end. Standard Interstate orange enamel, set off with red sash, doors and roof, gives the car an attractive appearance. The company name and the name and number of the car are lettered on the sides. The three cars have been named "Scottsburg," "Indianapolis" and "Louisville."

Passenger comfort and safety were the two outstanding considerations in the design. A heavy, sound-insulated trail car, without air compressor, motors, or trolley pole, was the result. The sub-frame is built up

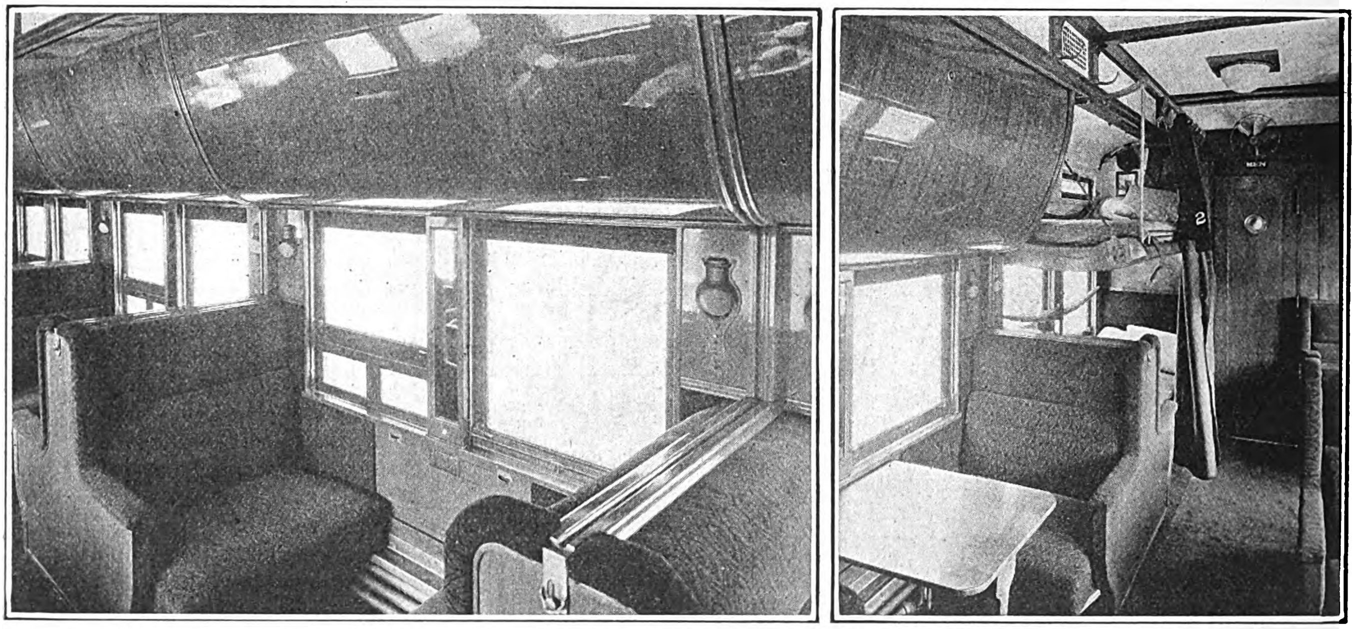
The Floor Plan Shows How, Despite Size Limitations, the Interior Was Arranged to Accommodate Comfortably 10 Berth Sections of two 7-in., 16.4-lb. channel center sills and 5-in. x 3½-in. x 5/16-in. side sills tied together with 7-in., 9.8-lb. channels with 8-in. x ¼-in. top and bottom plates, and 4-in., 5.4-lb. channel floor beams. The bolsters are built up of structural steel sections having 5/16-in. double web with a 26-in. x ⅜-in. top cover plate and a 12-in. x ⅝-in. bottom cover plate. The end sills are 7-in., 9.8-lb. channel sections with 12-in. x ¼-in. top cover plate. A 10-in., 15.3-lb. channel placed with flanges outward serves as a buffer beam at each end of the car. A 5½-in. Rico anti-climber 4 ft. long has been placed inside the channel at its center. This buffer is attached to the ends of the 7-in., 15.4-lb. channel platform arms, which extend to the bolster. The entire sub-frame is strengthened by 4-in., 8.2-lb. diagonal braces of Z section which extend between the bolsters and end sills, and between the bolsters and the adjacent floor beams.



At Left—Each Berth Section Is 6 Ft. 4 In. Long and 3 Ft. Wide and Is Arranged in a Manner Similar to that of a Pullman.
At Right—Ventilating Windows for the Upper Berth Are Provided and Two-Section Curtains.
In the Foreground Is a Folding Table for Use During the Daytime

Mounted on this sub-frame is a steel-framed body. The wider side posts are 2½-in. x 2-in. x ¼-in. angles, while the narrow ones are single 3-in., 4.1-lb. channels. The letterboard is between the single sash windows and the small upper berth windows. The carlines are 2-in. x ½-in. x 3/16-in. angles bent to form the monitor roof, and are continuous from side plate to side plate. A tongued and grooved ½-in. poplar roof is laid on yellow pine furring attached to the carlines. Over this is a layer of felt paper and a layer of canvas. The side sheathing is No. 11 steel, reinforced and attached to the side posts, side sill, belt rail and side plate.

MANY CONVENIENCES ARE PROVIDED

Every effort was made to have the interior of the car commodious and luxurious in appearance. The ladies' dressing room at the front end of the car, with a passageway to one side, is somewhat larger than that found on Pullman cars. A three-section mirror is located on each of the two side walls. Below each mirror is a dressing shelf and a hair receiver. Three low-back, upholstered chairs have been provided. A corner washbowl is directly under one of the windows and a dental lavatory is between the two side windows. The finish of the woodwork and walls below the belt rail is light mahogany. Above the belt rail the side walls are finished in buff enamel decorated with gold. A dome light and three wall fixtures provide illumination over the mirrors. Two towel racks have been mounted over the side windows. The interior finish of the toilet room is white enameled Lincrusto wallboard with an embossed tile design.

The men's room occupies the entire width of the car at the rear end. It has a three-bowl washbench along one side and a single bowl and small upholstered seat on the other side. Water for use in the dressing rooms and toilets is supplied from a 100-gal. tank located over the vestibules and dressing rooms at each end of the car. The bowls were furnished by the Adams & Westlake Company and are arranged with tilting lever faucets and drain. The interior finish of the men's room is of light mahogany throughout with the exception of the ceiling, which is finished in white enamel to correspond with the rest of the car. Artificial illumination is afforded by a dome light and five wall fixture lamps.

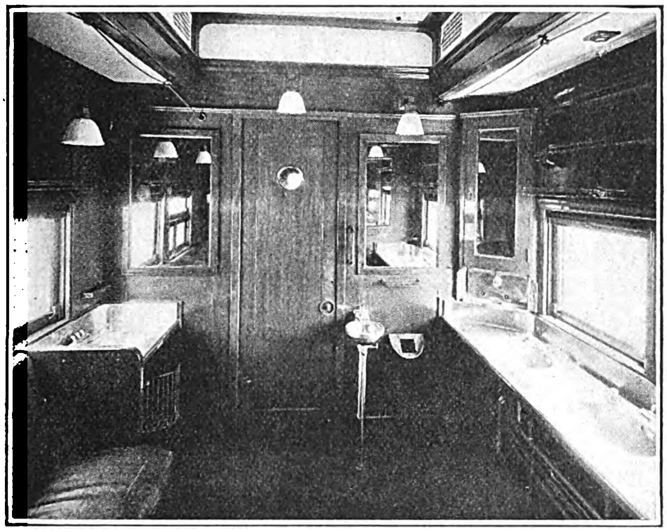
On one side of the rear vestibule is the men's toilet. The other side holds the coal box and Peter Smith hot water heater. Three rows of heater pipes extend the entire length of the car on either side.

BERTHS ARE EXTRA LONG

The car has 10 berth sections. Seating accommodations are sufficient for 40 people. Each section is 6 ft. 4 in. long and has a width of 3 ft. These provide a berth longer by approximately 3 in. than that in standard sleeping cars. The cushions and backs of the seats have spring-edge wood frames and are upholstered in green figured plush. The arrangements for making the berths are similar to those in Pullman sleepers of the latest type. Mexican mahogany with hand-rubbed finish is used for all interior trim. Fixtures are finished in dull statuary bronze.

Two windows 8 in. high and 23½ in. wide, arranged so as to swing in at the top, are placed in the side wall of each upper berth. Permanent copper wire screens are fastened on the outside and the sash may be regulated to any desired position. In addition to the ventilation afforded the lower berth by means of a sliding type ventilator in the lower edge of the storm sash, an independent ventilator is located in the inside lining directly below the narrow side post. This has a slide cover in the inside wall, while its lower end opens under the car. Fifteen American Car & Foundry Company's exhaust-type ventilators are located in the monitor and have 6-in. x 12-in. registers. A 6-in. Globe ventilator is placed in each toilet room.

Floor lamps are installed under four of the seats, to illuminate the aisle when the deck lights are off and the berth curtains are closed. Each upper and lower berth has two shaded lamps. Berth lamps, floor lamps, dome lights in the main compartment, washrooms and toilet, and the fixtures in the dressing room are operated from the 32-volt storage battery. A single five-light, 600-volt circuit for emergency purposes consists of two unshaded lamps in the main compartment, one in the smoking room, one in the vestibule and one in the ladies' dressing room. Push buttons are connected to a 26-position annunciator located on the wall in the rear vestibule.



The Men's Smoking Room at the Rear End Takes Up the Complete Width of the Car. Washbowls, Mirrors, Drinking Water and Seat Are Provided

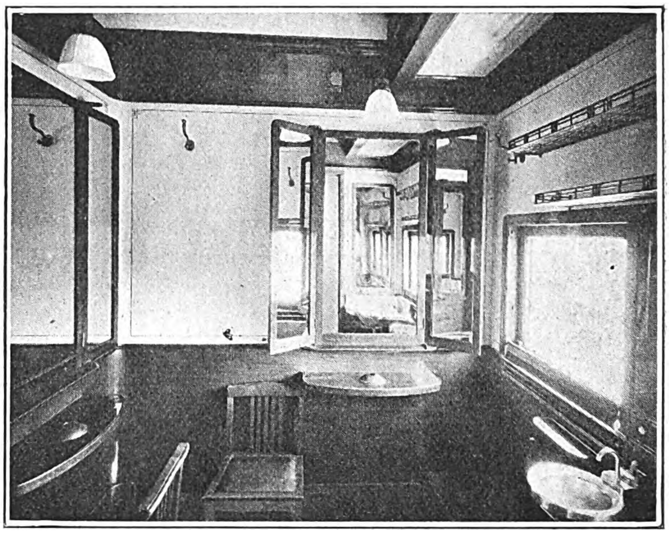
Precautions to Deaden Noise

Insulation against road noises has been accomplished by means of heavy flooring. A $\frac{13}{16}$-in. yellow pine false flooring is cleated to the stringers; it is separated by a 1-in. layer of hair felt from the double tongued and grooved yellow pine flooring, the lower course of which is $\frac{13}{16}$ in. thick while the upper course is $\frac{15}{16}$ in. A layer of building paper separates the two courses. Over the vestibule floor, trapdoors, passageway and smoking room floors is a layer of 1-in. red and green checkered inlaid linoleum. The ladies' dressing room, ladies' toilet and main section of the car are covered with a green figured Wilton carpet, with one layer of felt underneath. The floor in the men's toilet is of Flexolith, reinforced with galvanized-iron wire screening. The side and end walls are insulated with two-ply salamander composition fastened to the outside sheathing.

A Federal portable vacuum cleaner has been provided. Two electric outlets for attaching this are available, one in the men's washroom and the other in the passageway at the forward end of the car. Folding tables are also a part of the equipment.

Sleeping Car Schedule Is Slow

As it is only 110 miles between Louisville and Indianapolis and the running time for a high-speed train is only 3 hours and 45 minutes, it was considered necessary to arrange a new schedule for the sleeping cars in order to bring them into the terminals at a reasonable hour in the morning. A car is ready for occupancy in either terminal at 9 p.m. At 11:30 it is coupled to the last regular train out of the terminal, and by operating on what is known as a "slow drag" the car has a quiet trip going south from Indianapolis to Scottsburg, which requires approximately 3½ hours and is approximately 50 minutes run from Louisville. Here the sleeping car is detached from the train and placed on a siding. At 6:10 in the morning it is picked up by the first train into Louisville, arriving at the terminal at 7:05. A similar layover is provided in the other direction. Passengers are permitted to occupy the car until 9 a.m. The price of a lower is $2.75 and the upper is $2.



The Ladies' Dressing Room Contains the Latest Appointments, Including Two Sets of Three-Section Swinging Mirrors, Three Chairs, Washbowl and Dental Lavatory

The public had opportunity to inspect the cars while they were in the terminals prior to the inauguration of the sleeper service. In order to give the operating staff an opportunity to perfect the service, the company waited until after the sleepers had been running for two weeks before doing extensive advertising.

Acts as Entertainment News Editor

CLINTON D. SMITH, general manager of the Beaver Valley Traction Company, New Brighton, Pa., has found a new way of stimulating riding on the railway lines to reach entertainments, lectures and the like. This is the editing of a "What's Going On" department in the Beaver *Daily Times*, which lists the amusements, sports, and other public events. These items are gathered by the commercial department of the railway and published without charge by the newspaper.

WHATEVER the message—advertising for traffic or to build public understanding and good will—the "Underground" of London seems to have a way of presenting it that tells much at a glance or has an especial appeal from sheer beauty. The reproductions here lose much of their effectiveness because they do not show the colors, but they give a good idea of the subject matter at least.

Aside from those whose attractiveness helps to "put over" the suggestion for seasonal riding, note the extent of the story that is told. The poster to the right gives a remarkable bird's-eye view of the location of all underground stations. The poster itself measures 50 x 39 in. Another shows the increased distance that can be covered in 15 minutes on the Underground as compared to walking or riding the bus or the taxicab. Another tells a construction story without a word and still another shows the way to overcome delays due to traffic.

We Americans, though greatly superior in the character of our general magazine advertising, nevertheless lag far behind these London railway men in our transportation advertising.

Analysis of New York Surface Transportation

THE accompanying two tables give in brief form the main factors with which to compare the operation of the street railways in New York City with that of the Fifth Avenue Coach Company and the municipal buses. They were prepared by John A. Beeler, consulting engineer, New York, and it may be said that the information is from reliable sources.

SURFACE TRANSPORTATION—MANHATTAN AND BRONX—YEAR ENDED JUNE 30, 1923. ANNUAL OPERATIONS

	Fifth Avenue Coach Company	Municipal Bus Estimated	Surface Railways
Operating revenue (a)	$5,710,557	$3,500,000	$28,626,829
Operating deductions (b)	$3,978,823	$3,018,000	$23,008,040
Taxes	586,223	376,000(c)	2,129,689
Total operating deductions	$4,565,046	$3,394,000	$25,137,729
Net earnings	$1,145,511	$106,000	$3,489,100

(a) Includes passenger revenue and other revenue from operations.
(b) Includes operating expenses and reserve for renewals and retirements.
(c) Estimate based on cost to Coach Company on a ton-mile basis in order to make a true comparison of operations.

The commodity which all three systems are selling is transportation and the method that delivers the most car-miles per car-hour has an advantage over the others. At present the street car is last, making but 7.16 miles, while the coach leads with 8.17.

Traffic on Fifth Avenue is given every advantage over the crosstown traffic under the present tower system. Another condition favoring the Fifth Avenue Coach Company is that its routes are in large part over thoroughfares free from intersecting streets, such as along Central Park and out Riverside Drive.

SURFACE TRANSPORTATION—MANHATTAN AND BRONX—YEAR ENDED JUNE 30, 1923. COMPARATIVE OPERATING STATISTICS

	Fifth Avenue Coach Company	Municipal Bus Estimated	Surface Railways
Passengers carried (revenue)	55,974,100	70,000,000	502,350,281
Passengers carried (transfer)	3,450,608	....	77,069,244
Passengers carried (total)	59,424,718	70,000,000	579,419,525
Per cent total surface passengers carried	8.4	9.9	81.7
Maximum vehicles in daily service	293	206	1,599
Average seats per vehicle	48	20	44
Revenue-miles	10,019,805	9,022,500	43,909,814
Revenue-hours	1,224,493	1,203,000	6,125,732
Miles per hour	8.17	7.50	7.16
Passengers per revenue-mile	5.92	7.76	13.20
Seat-miles per passenger	8.10	2.58	3.32
Average length revenue ride, miles	1.85	.90	1.41
Average per cent seats occupied	23	35	42
Cash rate of fare, cents	10	5	5
Receipts per passenger, cents	9.62	5.00	4.95
Amount per mile, cents	5.41	5.55	3.54
Operating revenue per hour	$4.67	$2.91	$4.68
Total operating deductions including taxes per hour	3.73	2.82	4.10
Net earnings per hour	.94	.09	.58
Operating revenue per mile, cents	57.0	38.7	65.4
Total operating deductions including taxes per mile, cents	45.6	37.6	57.3
Net earnings per mile, cents	11.4	1.1	8.1
Per cent operating expenses to total operating revenue	69.7	86.2	80.6
Per cent taxes to revenue	10.3	10.7	7.4
Per cent net earnings to revenue	20.0	3.1	12.0
Investment	$3,612,000	$2,500,000	$88,714,429
Investment per dollar of total operating revenue	$0.63	$0.72	$3.10
Investment per passenger carried, cents	6.1	3.6	15.3
Per cent return on investment	31.5	4.2	3.9

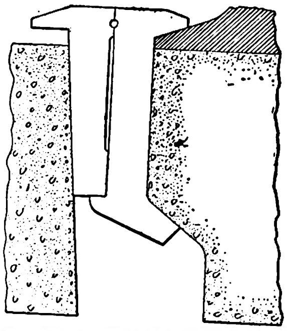
The municipal buses operate under much less favorable circumstances and are doing fairly well, making 7.5 m.p.h. Their operations are practically confined to short-haul crosstown routes in populous districts.

In order to make a true comparison of the operations, Mr. Beeler added taxes to the operating deductions of the municipal bus. As operated, however, this is not done and the buses actually enjoy an earning power of 13.5 per cent. The Fifth Avenue Coach Company earned 31.5 per cent. The street car, after all operating deductions including taxes, earned 3.9 per cent. With the street cars relieved of taxes, as are the municipal buses, they would show a net earning of 6.4 per cent, even under present low speeds.

Looking at the situation from another angle, the municipal bus with its short-haul riders and the Fifth Avenue Coach Company with its 10-cent fare average about 5.5 cents per mile per passenger, while the railway averages 3.5 cents.

Concrete Ties Tried in Bangor

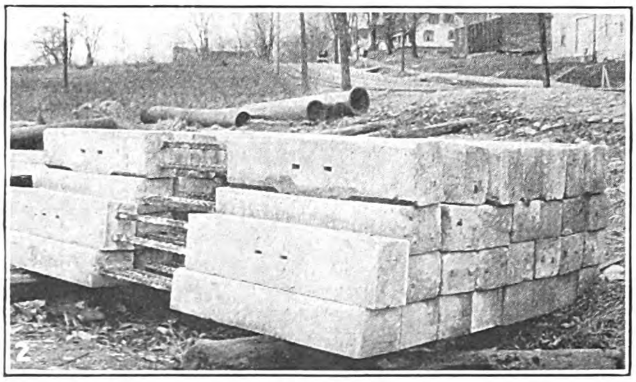
A TRIAL installation of reinforced concrete ties was recently made by the Bangor Railway & Electric Company, Bangor, Me. These ties are of unusual design, consisting of a rectangular block at each end and two steel connecting rods. The rectangular concrete blocks are of the same general cross-section as the ordinary wood tie, with beveled edges. The steel rods run throughout the length of the tie. Spike holes are made in the concrete when it is cast.

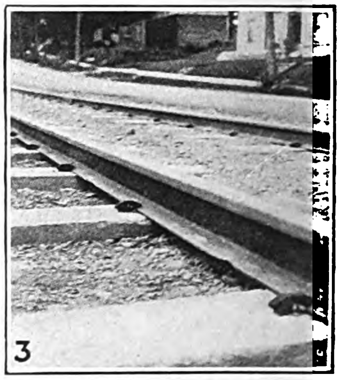


Detail of Spike and Spike Holes in Concrete Ties

The rail rests directly on the concrete, to which it is fastened by a spike of special design. This spike secures its grip by hooking under a in the lower part of the tie. projecting edge of concrete Driving the spike is facilitated by making it in two parts, which are inserted successively. After being inserted, the two parts are held in place by a cotter pin, as shown in the accompanying sketch.

Thirty ties of this type have been installed on the





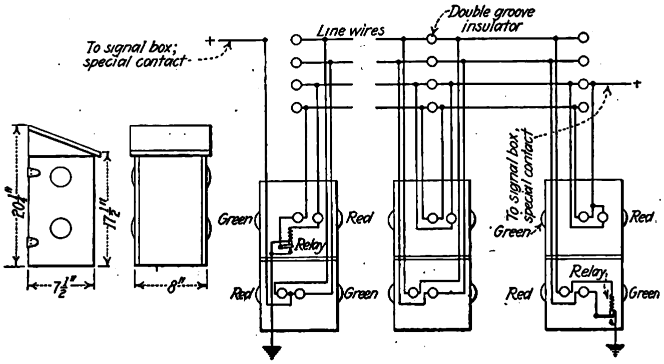
No. 1. Trial Installation of Concrete Ties on the Bangor Railway & Electric Company. No. 2. The Ties Are Made of Concrete Blocks Connected by Steel Rods. No. 3. The Special Spikes Used Are Made in Two Parts Held Together by a Cotter Pin

Hampden line on private right-of-way, under the supervision of E. W. Jennison, engineer maintenance of way. The ties are manufactured by the Maine Concrete Tie Corporation, Corinna, Me. They present a neat and attractive appearance, and so far as casual observations show, they make a track structure with about the same riding qualities as track built with wood ties.

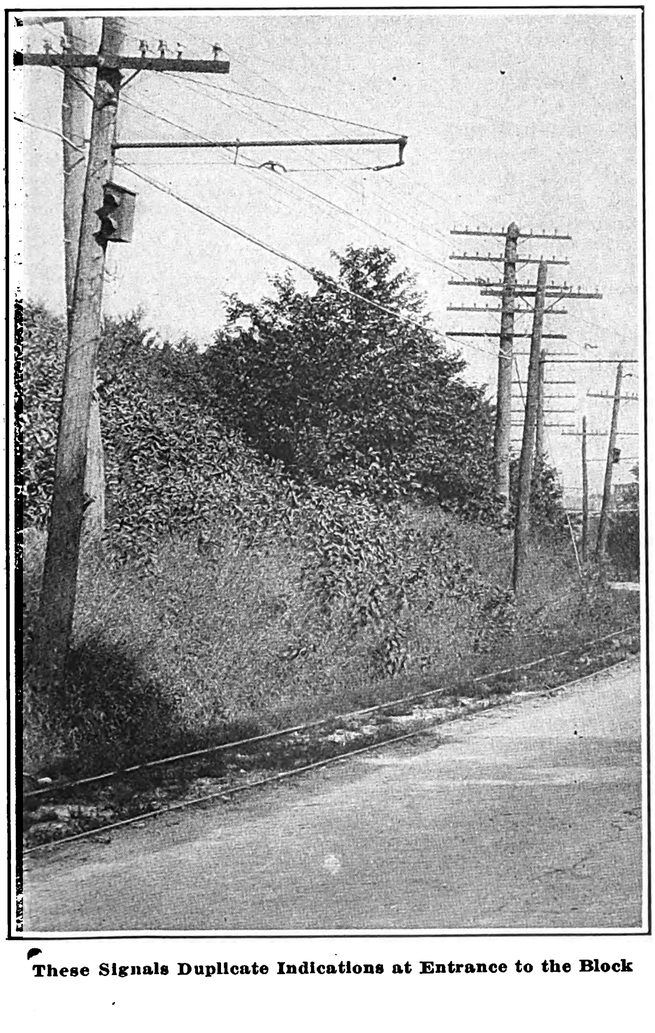
Duplicate Signal Protects Blind Curve

ON A DANGEROUS stretch of single track where there is a combination of blind curve and steep grade on the lines of the Androscoggin & Kennebec Railway, Lewiston, Me., protection is afforded by a duplicate signal system. Several accidents have occurred at this point, and investigation showed that confusion existed at times in the matter of signals.

Chapman registering signals are standard on this railway. In the rush hours, however, trippers operate through this stretch of single track in groups of four or five. As these cars follow one another rapidly past the signal contactor it is difficult to tell whether all cars register properly. In case the last car fails to register, it is, of course, left unprotected in the block as soon as the preceding car has cleared the signal. Under these circumstances, the car on the single track being out of sight around the blind curve, an opposing car might enter the block.



Connections of End Signals and One Intermediate Signal



These Signals Duplicate Indications at Entrance to the Block

To eliminate this danger the railway has installed auxiliary signal lights at two points on the curve. Each auxiliary signal contains a red and green light electrically connected to the main signal system. When the registering signals are set for an outbound car in the block, green lights show in the auxiliary signals. If a motorman has failed to set the signal when entering the block these lights will not be burning. If by chance he should be in the block running against an opposing signal the auxiliary lights will be red. In this way, motormen after entering the block are reminded of the signals and know whether they are proceeding in safety or not.

The signal boxes were built by the railway at the suggestion of the Chapman Company. There are four circuits in each box, two for each light. An arrangement has been made whereby a relay closes the second circuit if the first burns out. This installation has saved the necessity for double-tracking this portion of the line.

The Readers' Forum

Comment on Foreign Committee Report

THE INTERNATIONAL REGISTER COMPANY

CHICAGO, ILL., Oct. 23, 1924.

To the Committee:

Not until this morning have I had an opportunity of glancing at your report, but I have the very handsomely gotten up pamphlet reprinted from the ELECTRIC RAILWAY JOURNAL of Sept. 20, 1924, and I have spent an hour or more this morning glancing it over and am now starting on a thorough reading of it.

First of all, it is evident from your itinerary trip on page 114 that this was no junket, and you fellows surely did lay out a hard road to travel and evidently traveled it. It seems to me that this extended and complete report of yours is pretty nearly a classic and is something that is going to be read very carefully and sometimes several times over by those having any interest whatever in transportation problems.

I think you are to be congratulated most heartily on this most wonderful report. It shows not only the diligent study and careful inspection of what you saw but that you have the ability and have used that ability to put the facts before us in such readable form and yet so thoroughly condensed.

JOHN BENHAM,
Vice-President.

From 300,000 to 400,000 miles without turning is obtained on the wheels of London Underground trailers by using "feroda" asbestos brake lining for the brakeshoes. Three or four layers of this material are bolted on to cast-iron backs held on the brakeshoe head in the usual way.

Association News & Discussions

New Englanders Resume Activities

The Program at Boston Last Week Featured Maintenance, Education and Bus Application

THE first meeting of the New England Street Railway Club this season, held on Oct. 30, attracted a large attendance on account of the diversity of topics included and the caliber of the speakers. Afternoon and evening sessions were held at the Copley Plaza Hotel, Boston, President Thomas Kendrigan being in the chair.

At the afternoon session W. C. Bolt, superintendent of rolling stock and shops Eastern Massachusetts Street Railway, Boston, presented a striking paper on "A Comparison of Maintenance Costs of Old and Modern Car Equipment," giving the results of the application of improved methods with increased production and lessened costs at the shops of this important system, and this was followed by a paper by H. N. Ransom of the Railway Improvement Company, New York, on "The Lubrication of Railway Motors." Abstracts of these papers appear elsewhere in this issue.

Following the usual dinner, Edward Dana, general manager Boston Elevated Railway and chairman of the educational committee of the A.E.R.A., gave a short talk on "Education"; A. E. Potter, president United Electric Railways, Providence, R. I., read an extended paper on "The Co-ordination of Motor Vehicle and Electric Railway Service by Electric Railways," and R. D. Hood, general manager Massachusetts Northeastern Street Railway, Haverhill, Mass., spoke on "Observations at the Recent A.E.R.A. Convention." Mr. Potter's paper is published in abstract on another page.

In his talk on education, Mr. Dana pointed out that through proper training in industry, many a "round peg can get out of a square hole" and find increased usefulness in congenial and well-fitted tasks. He outlined the work of the American Electric Railway Association during the past three years in the educational field and said that this movement, like the original "safety-first" movement, is slowly making headway but is surely gaining speed and scope. Many agencies are available to help utilities in this work, and some of the larger companies are big enough to set up their own educational activities. At present the success of a good deal of publicity work is spoiled by the ignorance of employees. The speaker paid a tribute to the pioneer work of the Milwaukee company and commended the educational activities of the operating organizations at Fort Worth, Tex.; San Francisco and other places. He also referred to a useful pamphlet, printed by the A.E.R.A. educational committee, and entitled "Starting Educational Work on the Electric Railway."

Mr. Dana described briefly the work of the Boston company in the educational field. Several hundred men have taken courses under the auspices of the Massachusetts Department of University Extension during the past two years on the Boston system. This year 600 men are enrolled, and group conferences are planned at which talks will be given on various aspects of the company's departmental activities. Thus, in the maintenance group there will be a rolling stock session with talks on car-body painting and car repairs, and in the transportation department the fundamentals of operation will be set forth by qualified speakers. Each year in May there is a dinner at the end of the course, and the students have been addressed on these occasions by no less personages than the presidents of the Massachusetts Institute of Technology and Harvard University. The day will come, Mr. Dana said, when the Boston company will have its own educational director.

The educational committee does not propose to be a taskmaster to the industry, but merely to help in this work of organized instruction. In this connection Pennsylvania State College is preparing a practical, common-sense publication which will give in clear terms the fundamental economic principles of the public utility business.

Reducing Maintenance Costs*

Notable Savings in Cost and Greatly Increased Mileage per Pull-In Are Effected Through the Use of Modern Equipment

By W. C. Bolt
Superintendent of Rolling Stock and Shops
Eastern Massachusetts Street Railway

THERE is a great difference between the service demands today and those of 10 years or even 5 years ago. Our standard of service efficiency has been greatly increased within recent years. We believe that on our property we have in a large measure met the new service demands of the riding public, and we are now able to operate approximately 1,700,000 electric railway passenger car-miles per month with approximately 100 car failures, resulting in car pull-ins.

It has become necessary in recent years to add a great many detailed equipment parts, including pneumatic door-operating equipment, folding doors, heat-regulating equipment, variable load brake equipment, destination signs, emergency air-brake equipment, air-sanding equipment, pneumatic snow scrapers, better lighting equipment, electric contactors and many other refinements. All of these parts necessarily require careful inspection, attention and maintenance. We cannot regard the cost of maintaining the modern car in the same light as the cost of maintaining the old simple car. It is wise business policy to provide each year some new equipment and replace old equipment which has become obsolete. Yet by scientific study the cost of maintaining our present modern cars has been reduced to a very low figure.

Our cost of car maintenance since 1918, in cents per revenue car-mile, is given in the accompanying table. This cost excludes all fixed charges, such as depreciation and retirement of equipment, and represents only the following Interstate Commerce Commission accounts:

29—Superintendence of equipment
30—Maintenance of car bodies, trucks and air brake equipment
32—Maintenance of brakes and service cars
33—Maintenance of electrical equipment
36—Shop tools
37—Shop expense
39—Miscellaneous equipment

The average age of our car equipment, as of Jan. 1, 1920, was 12 years, some cars being 22 years old. The average age of our passenger equipment as of Jan. 1, 1924, was 7 years, there having been added to our complement of equipment within the last 4 years 225 safety cars and 75 double-truck, light-weight cars.

Our maintenance figures, as given in the table, include the cost of maintaining our rather extensive fleet of snow-fighting and service equipment, comprising 11 double-truck service cars and 114 snow-fighting units, of which 84 are double truck and 30 single truck. The expenditure for the year 1923, for instance, for rehabilitation of snow-fighting equipment was $103,000.

We likewise include in these expenditures all indirect expense at our two major shops, such as services of watchmen, janitors, firemen, the expense of heating the shops, cost of a.c. power for operating machinery and the d.c. trolley power used in the shops on a basis of 2 cents per kilowatt-hour. The figures also include the cost of inspection of equipment at carhouses, sometimes charged to the operating group of expenditures. On the Eastern Massachusetts Street Railway this expense is considered a part of the maintenance of equipment group and represents approximately 0.7 cent per car-mile.

---

*Abstract of paper presented at a meeting of the New England Street Railway Club, Boston, Mass., Oct. 30, 1924.

While the cost of maintaining our equipment as a whole is now 3½ cents per car-mile, we have some divisions where this cost is only 1.6 cents per car-mile. This figure, by the way, represents the actual cost of maintaining 10 standard Birney safety cars for a period of 44 months. These 10 cars during this period have made approximately 1,200,000 car-miles. Each car has had two complete shop overhauls and painting, one at the end of 60,000 car-miles and another at the end of 120,000 car-miles and each car is today in first-class mechanical condition. In other words, there is no deferred maintenance on these 10 cars. The cost of 1.6 cents per car-mile may be classified as follows:

	Cents
Carhouse inspection labor per car..........	0.425
Replacement of rapidly wearing parts at car houses..............................	0.250
Shop expense, including overhaul and paint..	0.925

We define a car pull-in as "any car removed from service prior to completion of its regular prescribed run, for any mechanical or electrical failure." In July, 1920, we had 222 cases of air brake failures, 180 cases of controller failures, 339 cases of hot bearings, 101 cases of wire and cable failures, and numerous others, aggregating a total of maintenance pull-ins of 1,489, or a pull-in for every 1,400 miles. In September of this year we had a total of 104 car pull-ins, or one pull-in for every 14,500 miles. Even now we have a wide variation as between our several divisions. One of our larger divisions is now operating 75,000 car-miles for every car pull-in. These two illustrations clearly demonstrate the changed conditions. The table also gives the car-miles per maintenance pull-in from 1920 to date.

In July of 1920, when we operated a large proportion of old type equipment, we employed 346 so-called "carhouse employees," this representing one employee for every 6,000 passenger car-miles. At present our carhouse organization comprises 132 employees, or one employee for every 12,000 car-miles. Similarly at our major shops in July of 1920 we employed 447 employees, or one employee for every 4,700 passenger car-miles. Today we are employing 188, or at the rate of one employee for every 8,400 car-miles.

METER RECORDS AND OTHER IMPROVEMENTS

Early in 1921 it was decided to place our car maintenance on a systematic basis, and power meters were installed on each active car equipped with so-called "inspection dials." These inspection dials have materially assisted us in determining promptly and at minimum cost when individual cars become due for attention.

In 1921 we established a shop overhaul schedule of 30,000 car-miles. This was later increased to 45,000 car-miles. As rehabilitation of our equipment and materials of more suitable design and size were installed, the overhaul interval was later changed to 60,000 car-miles, and now all of our modern equipment cars are overhauled on a basis of 75,000 car-miles.

TABLE SHOWING DATA ON CAR MAINTENANCE, EASTERN MASSACHUSETTS STREET RAILWAY

	Total Charges to Car Maintenance, Exclusive of Depreciation and Obsolescence	Cost of Car Maintenance, Cents per Car-mile	Wage Level, Cents per Hour	Average Maintenance Pull-Ins per Month	Car-Miles per Maintenance Pull-In
1918	$1,361,000	5.02	37.0	......	......
1919	1,485,000	5.70	48.0	......	......
1920	1,418,000	6.20	58.0	1,203	1,550
1921	915,000	4.63	57.0	869	1,884
1922	857,000	4.42	54.5	414	4,035
1923	797,000	4.06	56.0	248	6,745
1924*	650,000	3.54	58.0	163	9,638

* First nine months of year.

NOTE—Figures for car maintenance include cost of car overhauling and repainting.

Our car maintenance today is carried out according to this schedule, and we are able through this means to maintain our equipment efficiently and at minimum cost. We have planned our work so that our organization is kept at a constant size, thus assuring the highest standard of work on the part of each workman. Each man is a specialist in his particular duties and he has no fears that he will shortly be without a job.

This plan has enabled us to reduce our carhouse requirements for small, rapidly wearing parts from a total of $190,000 in 1921, or approximately 1 cent per car-mile, to $87,000 for the year 1924, or less than ½ cent per car-mile.

Modern practice, together with modernization of equipment, has contributed largely to our substantial reduction in armature failures. In 1920 we were having armature failures at the rate of 500 per month. These failures were largely on motors of the old types, including GE-67, GE-80, GE-57 and GE-1,000, these representing 12 per cent of the total motors in service which failed during the one month period. At present our failures aggregate 65 or 70 per month, or 1.7 per cent of the total in service.

In 1920 we operated less than 5,000 car-miles per armature failure. Now we operate approximately 30,000 miles per armature failure, and this record could be substantially increased if these failures should be burdensome. It still is our practice, however, to run some of our armatures to the point of breakdown, thus securing maximum life of the armature winding. Every armature on our property is dipped and baked and thoroughly tested every 60,000 or 75,000 car-miles, and this procedure has very materially decreased our armature troubles.

Similarly, thorough examination, testing, dipping and baking of field coils every 75,000 car-miles has reduced our field coil failures from some odd 300 per month in 1920 to practically 100 per cent performance. As a matter of fact, we have not purchased any new field coils for some two or three years.

Modernization of our air brake equipment has produced results. In 1920 we had an average of 80 AA1 air armature failures per month, this representing approximately 12 per cent of the total number of AA1 air compressors in service. Today an air motor armature failure is practically unknown.

Substantial progress has been made in the matter of car lubrication. In 1920, with a larger proportion of old type equipment, we were using at the rate of from one to 1¼ gal. of car oil per 1,000 car-miles. We are now using less than ½ gal. of car oil per 1,000 car-miles. I think, however, that our lubrication methods are still crude and that further progress can be made in this direction, not only for savings in oils and greases, but also in bearings themselves. Dust and dirt today are responsible for a great deal of wear in armature and axle bearings, and as soon as bearing housings are so constructed as to keep dirt and grit from getting into the wearing surfaces further savings will be possible, this affecting not alone oil and bearings, but also the rotating shafts. When this has been accomplished, we may expect perhaps 150,000 or 300,000 car-miles per set of axle and armature bearings, as distinguished from the 75,000 car-miles which we are now securing on our modern motors.

To overcome frequent resistance failures on our safety cars we have, within the past two years, installed the resistance on the roof of the car, and during the past winter we had no resistance trouble on cars which had been so arranged.

We believe in frequently repainting our cars, but by the paint-spraying system our repainting costs have been substantially reduced. We have always felt that the light yellow color with which our cars were painted has made the cars easily visible and has had a tendency of avoiding a great many accidents.

Within the past year we have removed cumbersome draw bar and fender apparatus from our cars. This has tended to eliminate at least some of the ordinary rattles and has also saved some weight.

Welding equipment has played an important part in our campaign of cost reduction. Many equipment parts are constantly being repaired and the purchase of new parts has been avoided. A great deal of welding has been done on our car trucks, so that they now operate with less noise and rattle than heretofore.

DOUBLE-TRUCK, LIGHT-WEIGHT CAR

This discussion would not be complete without mention of the so-called "double-truck, light-weight car." We cannot always justify the purchase of new equipment entirely through anticipated savings in the cost of maintenance. This is particularly true with light-weight cars. While some savings in maintenance may be expected, the larger savings accrue from reduction in power consumption and the lessened wear and tear on tracks. The latter two items of saving should easily pay for the fixed charges on the new investment. Our records indicate that the total cost of maintaining a double-truck, light-weight car, weighing perhaps 32,000 lb. and equipped with four 25-hp. motors, together with all of the other modern appurtenances, would be in the neighborhood of 2 cents per car-mile for the first 100,000 car-miles. This figure would include the reconditioning of each car at the end of this mileage interval. If we did not include the cost of reconditioning, the cost would be approximately 1.2 cents. During the second cycle of 100,000 car-miles this cost would be slightly increased.

I attribute the success of the Eastern Massachusetts Street Railway and its present wonderful financial stability in no small part to the savings made in our maintenance of equipment as outlined. Modern equipment systematically maintained will result in efficient and uninterrupted service to the public and in low cost of maintenance.

Seven Kinds of Bus Operation*

United Electric Railways of Providence Has Already Undertaken Five Different Classes of Service—Direct Profit Is Not Expected—Chartered Buses Are Good Revenue Producers

By A. E. Potter
President United Electric Railways, Providence, R. I.

When the United Electric Railways formulated a program for the operation of buses it had seven plans of operation in view. The transportation system in Providence radiates from the center of the city like the spokes of a wheel, with Pawtucket and Woonsocket lying to the north and having similar radiating lines. Cranston is to the south and Arctic and the rest of the Pawtucket Valley to the southwest.

Plan No. 1 was to provide both local and express service, either the buses furnishing the local service and the electric cars running express, or vice versa. This method has been adopted on Broadway between the center of Providence and Olneyville Square. [See Electric Railway Journal for March 15, 1924.] The Broadway bus line shows earnings of 36.02 per cent per bus-mile for the nine months ended Sept. 30, 1924, and indicates what may be expected of bus operation on lines where there is some density of traffic.

Operation of cars running local between Providence and Pawtucket and buses running express was also considered. Pawtucket is a community of some 75,000 people, lying about 4 miles to the north of Providence. The reasons for considering a different arrangement were that the car lines between Providence and Pawtucket terminate in Pawtucket, and that four car lines operate to Pawtucket, branching out in four directions after leaving Providence. It was planned to reverse the Broadway operation and run the electric cars local and the buses express. Nothing has been done in inaugurating this type of service because part of the highway over which the electric cars operate has been widened and passing tracks installed and express electric car service established. [See Electric Railway Journal, July 12, 1924, page 45.]

Plan No. 2 was to provide direct interurban limited stop express bus service or to supplement electric car service on high-speed interurban lines which stop only at stations. A direct limited-stop express service has been put into operation, known as the Arctic bus line. Arctic is a community in the center of a mill settlement of more than 15,000 inhabitants, approximately 10 miles from Providence. There are also other settlements along the car line between Providence and Arctic, and to serve these other settlements the line takes a somewhat circuitous route. This is shown by the fact that the running time of the car is 70 minutes, against 40 minutes for the express bus.

There are independent jitneys operating on this line, this time being the one instance where the Public Utilities Commission granted the petition of several jitney operators for certificates of necessity. The decision was based on the fact that this route paralleled no tracks and the jitney route was established before the United Electric Railways began bus operation.

At first a street car type bus was operated. However, on March 4, 1924, three parlor car buses were put into operation and the patronage on this line increased considerably in a short time. But the mill depression, which has been particularly severe in Arctic and the vicinity, has of course been reflected in the revenue. Recently some of the independent operators who had been operating built-over touring cars have substituted 20-passenger buses. This bus line, with earnings of 24.22 cents per bus-mile for the nine months ended Sept. 30, 1924, should be one of the best paying bus lines operated by the company, and would be were it not for the fact that jitneys leave just ahead of the buses of the railways. There does not seem to be sufficient business for all and it is a question which can survive the longer.

The United Electric Railways is operating buses to supplement its car service on a high-speed interurban line between Providence and Oakland Beach, approximately 12 miles in length. The car line operates for a great part of the distance over a private right-of-way and stops only at stations. There are, however, scattered colonies along the line and in many instances a walk of a mile or more is necessary to reach a station. This bus line parallels the car line, following the state road, and passes through the several scattered colonies which are not served by the high-speed electric car line, cutting across country and crossing the electric car line at three points. Buses stop on signal. The colonies along both these lines are essentially summer resorts and in the winter both car and bus service is considerably reduced.

This bus line for the nine months ended Sept. 30, 1924, earned only 24.50 cents per bus-mile in the winter months except for the fact that it serves territories that are more or less remote from the trolley stations. In the summer it shows earnings in excess of 32 cents per mile.

Plan No. 3 was to furnish auxiliary service on heavy riding car lines. This type of operation has not been put into effect although it has been considered. Such lines may be relieved in the downtown congestion by supplementing the car service with bus service and using streets for loading where there are no tracks.

Plan No. 4 was to furnish auxiliary bus service on lines where the present car service has outgrown the existing turnouts, and where the street is not sufficiently wide to permit of double-tracking. As yet nothing definite has been done by the company in carrying out this program, although it has been considered in connection with two single-track lines on which it was becoming difficult to operate cars on schedule during the rush hour. The business depression, however, has lightened the traffic on these lines to such an extent that for the present it is not necessary to consider bus operation.

Plan No. 5 was to replace suburban car service with bus service where such lines are not earning sufficient revenue to take care of construction and renewal charges of track, overhead lines and substations. The United Electric Railways' greatest development in the bus field will shortly be in operating buses where car service has been abandoned. As an illustration of such operation the Pawtuxet-Lakewood line, slightly more than a mile in length and connecting the end of one line 5 miles out of Providence with a point about 5 miles out on another line 13 miles long, never paid the full cost of operation. The tracks for a part of the route were along the state highway and the State Board of Public Roads notified the company that the state intended to rebuild the highway. This would have necessitated renewing a portion of the track, at a cost in excess of the price of a modern 29-passenger bus. Accordingly, the company took up its track and substituted bus operation, thus reducing the losses on this line. This bus line earns only 5.50 cents per bus-mile.

Car service will be abandoned shortly on the Woonsocket-Nanville line, approximately 6 miles in length. The line is a rather circuitous route, with a mileage of 5.93 against 3.40 for the bus. Permission has been obtained for the operation of this line, but the company has been waiting for the highway over the proposed route to be rebuilt.

Two other suburban lines, the Providence-North Scituate and the Barrington-Warren and Bristol, have operated at a heavy loss for some time. Buses are now on order for operation on these lines and deliveries are expected early in November. As soon as the buses arrive operation will be started.

Plan No. 6 was to provide feeder bus service in territories which have no car facilities, but which are not sufficiently developed to warrant the capital expenditures necessary for track and overhead lines. One such bus line, the Pawtuxet-Warwick Downs, is in operation. It is approximately 1¼ miles in length and serves a summer colony. Only a few trips night and morning are run in the winter, although all-day service is given in the summer. Previous to inauguration of bus service, the residents had no transportation service whatsoever, either summer or winter, except what they could provide for themselves. This bus line showed earnings of 12.02 cents per bus-mile for the nine months ended Sept. 30, 1924, although in the summer months it shows earnings of about 20 cents per bus-mile.

---

*Abstract of a paper before the New England Street Railway Club, Boston, Mass., Oct. 30, 1924.

Plan No. 7 was to provide crosstown bus service to connect up existing car lines or to provide a means of transportation between two or more communities each in the same section of the city where there is a community interest, but which communities cannot be reached by cars except by taking a roundabout way through the center of the city. One such bus line is in operation in the outer district of Providence, known as the Olneyville-Eddy Street crosstown line. It is located about 2 miles outside the business center of Providence and operates from Olneyville to Eddy Street, a distance of 2½ miles. It crosses six existing car lines and connects with a car line at each terminus of the line. At both termini of the line there are a number of mills and factories. Many of the workers in these mills and factories live along this bus route or continue their journey on one of the electric car lines which the bus route crosses or connects with. Transfers are issued to and from the electric cars and buses on this particular operation. The line for the nine months ended Sept. 30, 1924, shows average earnings of 31.12 cents per bus-mile.

The United Electric Railways has not found that the bus business is profitable, as is indicated by the earnings on the lines as a whole. The Broadway bus line and the Eddy Street crosstown bus line are more than meeting the cost of operation. Other of the bus lines are not meeting the cost of service, nor was it expected that they would at the time they were inaugurated. The Pawtuxet-Warwick Downs, Providence-Oakland Beach and Providence-Arctic lines were put on to serve territory that was not served by the cars or that could be served better by buses. The Scituate and Barrington-Warren and Bristol bus operation is to be operated to reduce the losses due to heavy track maintenance.

The company has just offered some of its bus equipment for special or chartered bus service. It was believed that spare bus equipment might be profitably used for this type of service and this belief is borne out by the fact that in the month of September, 1924, the earnings were 83.15 cents per bus-mile. However, due to the irregularity of the demand for this service, the investment charges for equipment used in this service would be excessive were it not for the fact that this extra equipment is used from time to time in regular service.

Most of the non-paying bus lines and car lines act as feeders to the rest of the system, so that the car rider on the profitable lines is not actually obliged to pay any substantial sum on account of the rider on the unprofitable lines. Provided the operation of these non-paying car and bus lines is not overdone, it constitutes one of the advantages to the car rider and the community of a unified system of transportation, with a co-ordination of electric car service and bus service.

Obtaining Longer Life from Motor Bearings*

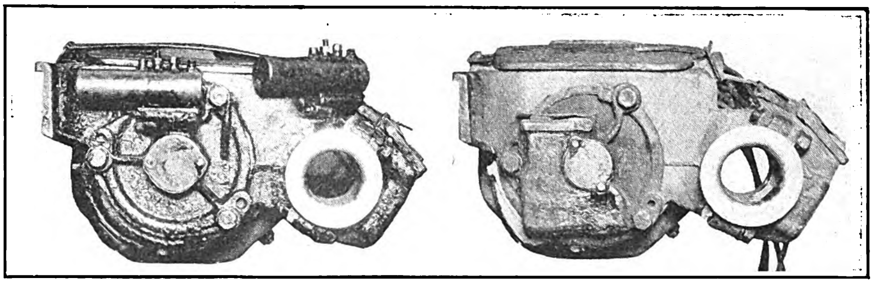
Important Maintenance Considerations Include Keeping Bearings Tight in Housings or Motor Frames, Keeping Out Dirt and Water and Providing a Moving Oil Film in Bearings

By H. N. Ransom

Sales Manager Railway Improvement Company, New York, N. Y.

At the recent convention of the A. E. R. A. at Atlantic City, I was admiring the bearings of a railway motor and I asked the designing engineer this question: "If that motor was operating under load in this clean hall, and a can of oil was suspended over it, dropping oil every few seconds into the bearing housings, how long do you think the motor would run?" His answer was: "Longer than you and I will live."

When I inspected another exhibit showing a side roller bearing, I was told by the engineer that they did not lubricate these bearings, due to the fact that oil or grease would collect dirt and grind the bearings out.



At Left, New Design of Axle Cap with Bearings Turned to Use a Solid Lower Half. At Right, Original Axle Bearing Arrangement

We all know that power-house apparatus and all types of stationary motors will run for years, and the bearings never seem to wear out. Last week I saw such a motor that had been in operation more than 20 years. If any engineer is asked why these bearings last longer than railway motor bearings, the answer always is: "Look where the car motor operates in all the dirt and water." If that is so, then how are the excellent results that are obtained from the bearings in air compressors accounted for? They are subject to exactly the same conditions as a railway motor. Why should one big railway spend in one year for motor bearings $22,300 and use only six bearings in its air compressors?

Did you ever stop to think that the four bearings in your motors must be true and the clearances held to a minimum so that motor axle and shaft will be in line and operate under the conditions for which the engineers design it? There are four bearings in the transmission case of your automobile, and you all realize that all these bearings must be O. K., and not just two of them.

Careful attention is given to the armature bearings of railway motors due to the fact that the air gap tells the story, and it costs big money if the armature goes down on the pole faces; but how about the wear on axle bearings? Are they given the same care and attention?

The gear and pinion manufacturer has a perfect right to expect his gears and pinions to be operated within a safe margin for clearances of bearing wear. Loose axle bearings are as dangerous to gears and pinions as are loose armature bearings. From a half to two-thirds of the mileage of motors is lost by axles and shafts being out of proper alignment.

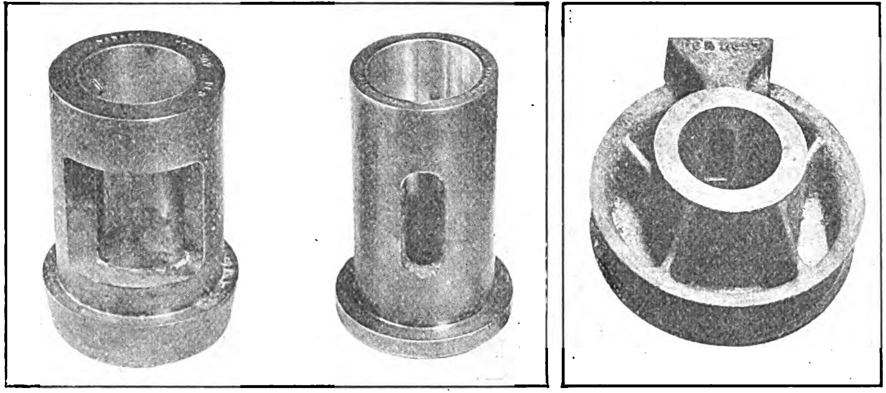
You are all 100 per cent on dipping and baking. Then why lose the good from such a process by allowing a hammer blow that will take place when the gear and pinion are not properly in mesh? These blows will loosen any armature coil and reduce the benefits from dipping and baking. I would suggest that you take your shop men out in one of your cars, operate it on a hilly route, open up the trapdoors, remove the gear case and watch what happens when the axle bearings and caps are worn and loose. An object lesson of this nature is often worth hours of talk.

Motors are manufactured with a clearance between the shafts and bearings to take care of metal expansion and to allow room for the oil. An armature shaft does not revolve on a bearing. It revolves on a sleeve of oil that in reality can be considered as a liquid bearing. How wonderful it would be if some one discovered a process whereby you could pour metal in a housing and form a new bearing without the great expense that is necessary to bring the motor into the shop and open it up. In one sense that is just what can be done with oil, if the sleeve of oil is not broken or destroyed by water. The oil sleeve keeps the shaft off of the bearing, and it is cheaper to wear out the oil than the bearing. To obtain maximum bearing wear, this sleeve of oil must be maintained and the shaft protected from pounding and wheel wash.

---

*Abstract of a paper before the New England Street Railway Club, Boston, Mass., Oct. 30, 1924.

If you take a motor with an extended armature shaft and slip on an extra bearing, you can hold this bearing in your hands with the motor in operation, if the bearing is lubricated. If water is poured in this bearing the twist will tear it from your grip. That is exactly what occurs in a motor when water enters the bearing, as the condition of the key, dowel pins and holes all goes to prove. These bearings are allowed to twist themselves loose and naturally wear on the outside, and also wear the frames or heads as well as the axle caps.



A New Design for the Housing Has Permitted the Use of Bearings with Reduced Size of Windows. No Keys Are Required to Hold the Bearings and Larger Bearing Surface Is Obtained. At Left, Old Bearing. In Center, New Type. At Right, Housing Without Keys to Hold Bearing

When new motors are put in service, the first bearing mileage is tremendous. After replacing the bearings the mileage from the second lot is hardly a quarter of that obtained from the original, because these are not held tightly in the motor frames or housings. Water enters the bearings and the shafts pound, which results in destroying the sleeve of oil that the shaft is supposed to run on.

As the clearance in the frames or housings increases some try to correct it by the use of shims. The wear that has taken place is not even, consequently it is practically impossible to obtain a perfect fit for a bearing by the use of shims. This also applies to shimming of housings in motor frames. More bearings and housings are ruined from this cause than any other. If you will spin your motors with power when assembled, you will be in a position to judge whether the bearings are pinching or not, and it is far cheaper than having the car sent back to your shop with a hot bearing.

If a motor is worth a set of new bearings, it should be put in condition to receive these bearings. When you changed from split to solid gears, you depended upon a key for safety. Today you know that with a proper fit the key is not necessary. The same principle applies to a bearing in a housing. If the waste window is not too large, the bearing will not buckle when pressed in the housing and the fit can be correct and held so, which will eliminate the use of keys in armature bearings. I know of hundreds of motors that are in operation that do not depend on keys to hold their bearings in the housings. The next time it is necessary to remove a bearing from a housing, record the pressure required and check this against the pressure the manufacturer used when the motor was assembled. I believe it is around 4 to 5 tons.

You are all welding and know you are saving money, and how essential your welding outfit is to your shop. Then why not weld and bore your motor frames and axle caps? Is it that you cannot afford to bore, since the welding is not expensive? Welding and boring cost less per motor than a set of new bearings, as is shown by a road that has just finished boring and welding 8,000 motors. Its record shows the bearing life has been tripled. You can also save pounds of metal in your bearings, as many of the old motors have bearings that will permit a cut in weight of nearly 50 per cent. You can also reduce the size of the waste window in both armature and axle bearings, which gives more metal to run on. A road operating high-speed service and using 7½-in. axles, by welding has been able to turn the bearings in the caps and use a solid lower half. The upper half is practically solid as only a 2-in. hole for the waste to come in contact with the axle is used, and as this hole is at the top the pounding really holds the waste to the axle and does not cause it to sag or drop away. This road is obtaining six times the previous life of its axle bearings.

I realize that most of the roads have specifications that call for well-chamfered bearings at the waste windows, but there are many bearings the edges of which are entirely too sharp, and I believe that it would be wise to have your men check this before the bearings are put in motors. A very good way to impress your men in regard to this point is to take a top feed motor and use a bearing properly chamfered on one side and one having sharp edges on the other. See that the clearances are kept to the minimum. Remove the waste and put in a cup of oil in each housing. On one side the oil will disappear around the bearing, while on the other it will be thrown out of the housing.

Use good wool waste. It's money saved, and remember that in the latest type of motors with oil wells the waste will only lift oil 3 in. There is a difference in the feed of oil to the shaft of 8 to 1 when oil in the window is lowered an inch. Many of the roads change from summer to winter grades of oil to counteract the change in temperature, but forget that a motor is subject to both electrical and mechanical heat. Heavy grades, trailers, snow, short circuits and stuck brushes will cause a variation of the motor temperature far greater than winter to summer climate conditions. It is most essential, if you wish to retain your sleeve of oil, to have oil in the bearing and not in your store room. Any bearing that shows oil coming out of the end is being well lubricated, and water cannot enter.

Dr. de Ferranti Honored

A LUNCHEON was given at the Yale Club in New York, on Nov. 6, by the Founders' Societies in honor of Dr. S. Z. de Ferranti. John W. Lieb, vice-president New York Edison Company, acted as toastmaster and extended the hand of professional fellowship and greeting to the guest of honor and spoke in a most complimentary way of his genius, broad vision and extraordinary ability as an engineer.

Dr. de Ferranti is president of Ferranti, Ltd., England, and one of the world's best-known engineers. He was one of the first to see the field of the central power station, and he has been the inventor and the first to demonstrate the use of many of the developments which can be said to be responsible for the tremendous growth of the use of electricity. He is a past-president of the Institution of Electrical Engineers of Great Britain, a member of the English civil and mechanical societies, and an honorary member of the American Institute of Electrical Engineers.

Mr. Lieb called upon Fred R. Low, editor of *Power* and president of the American Society of Mechanical Engineers; Alex Dow, president Detroit Edison Company and representing the American Society of Civil Engineers; J. V. W. Rinder, president-elect of the American Institute of Metallurgical and Mining Engineers, and Calvert Townley, past-president of the American Institute of Electrical Engineers, who expressed the felicitations and welcome of the four founder societies.

Dr. Ferranti responded. He showed his broad concept of the engineering profession when he said that engineering is the accomplishment of great things for the benefit of the community. Engineers work to do these things on such a scale and at such a cost that they can become available to all the people. He considered electricity as the greatest of labor savers and that it is of the greatest possible good to the whole of the people of any of the engineering products. He felt that there was nothing more worth while than to pursue its ultimate development. He reminisced on some of the original problems that he had had to work out in the very early stages of electricity supply in London and greatly interested his audience of 150 admirers. But he said the field still open for development is even greater than the accomplishments already made.

Obstruction Is Necessary to Real Progress*

At the Risk of Being Considered Reactionary Railway Men in New England Oppose Bus Operation Where This Would Duplicate Existing Service

By Robert H. Newcomb
Assistant to the Vice-President New York, New Haven & Hartford Railroad

WITHIN the past few years there has grown up in New England a new form of transportation, the value of which, in many cases, is very doubtful and the permanence of which is even more open to question. This development first confined itself to the carriage of freight over highways in motor trucks, but more recently the passenger bus has been added. The tremendous pressure of business incident to the World War was largely responsible for the first. It is probable that the activities of the bus builders are responsible for the great recent growth of the second.

If this development has come to stay, and apparently to some degree it has, then, in all fairness to every one, motor vehicles should be subject to the same regulations as are the railroads, and should show before they are allowed to operate that public convenience and necessity are to be served by their introduction. Anything less than this is unfair to the older forms of transportation. This applies with equal force to the steam railroads and to the electric street railways. Both existing forms of transportation face the same results if unregulated competition is allowed to continue. Both work under franchises which have great value and the maintenance of service under these franchises is of supreme importance to the people of New England. If, then, we are to have a third factor introduced into the problem of transportation, surely that factor should be limited and controlled as are the two others.

The present situation in Massachusetts demands attention. Too much leeway is permitted the bus and too little regulation covers its operation. In fact, there is no regulation whatever. Beyond securing a local license nothing is required in Massachusetts. It is significant that failure to secure a local license has seldom acted as a deterrent. The situation in Rhode Island and Connecticut is better. In those states it is necessary to secure a certificate of convenience and necessity before a license to operate is obtained. It is not at all clear, however, that even there the commissions have deemed it best to prescribe rates, routes and service to the extent that these are prescribed for street railways and railroads. As far as it goes, therefore, regulation in Rhode Island and Connecticut is sound.

Recently a new angle has been added to the problem. It is now being contended that where a bus line operates between cities in different states neither state has authority over its operation. No state can prohibit or unduly restrict interstate business, but surely each state may exercise its authority over the use and abuse of its highly extensive road system. If the reasoning of the bus men is sound, then no commission or legislature has authority over local railroad service, nor the right to issue charters and enact laws governing transportation agencies which cross state lines. In a community of short distances like New England any such rule becomes absurd.

If there is any railroad man who thinks that the passenger bus can be abolished he certainly is suffering from a condition which is likely to prove fatal to his employment. We must concede that the bus is here to stay. Our problem is to find a way to co-operate with it and to secure a condition which will place all carriers on the same footing. In the course of this last effort it will probably be inevitable that the railroads appear to be standing in the way of progress. As a matter of fact this is not at all what the railroads propose. But unlimited and unrestricted free use of the highways to the injury of all concerned is not necessarily progress. It may mark an increase in bus output at the factory, and it may be progressive when viewed from a salesman's standpoint alone. Present conditions, however, do not, and never can, make for permanent progress. Progress is not a selfish thing. The present situation has selfishness for its only excuse.

At the risk, therefore, of temporary misunderstanding it will be the policy of the New England railroads to tell the truth about the situation. Where buses operate in territory adequately served by present facilities objection to their continuing will be raised and insisted upon. If they are allowed to skim the cream of the income, then existing service will have to be reduced. This is not said as a threat. It is a statement of simple business law. No manufacturer can go on indefinitely producing a product for which there is no sale.

So long as a good sized slice of the taxes paid by the railroads is spent to maintain highways which are free to buses and trucks in competition with those railroads, just so long will the railroads persist in an effort to have the tax situation corrected and the bus and truck contribute their fair share of the general burden. So long as the railroads are supervised by public service commissions, regulated as to rates, service, and the like, then just so long will the railroads strive to have exactly the same supervision and regulation extended to buses and trucks. To combat the situation the railroads stand united. Progress to be permanently beneficial must be based on fairness to all, and not on the selfish interests of the few.

---

*Abstract of a paper presented before the company section meeting of the United Electric Railways, Providence, R. I., Oct. 16, 1924.

"Shop Early" Campaign Renewed

SO SUCCESSFUL was the industry in the use last year during the holidays of the "Shop More from 10 to 4" posters that the committee on publicity has recommended that a more intensive campaign be made this year to encourage off-peak-hour shopping.

Therefore, the "Shop More" poster used last year has been revised so that it appears in more striking colors. This poster can be obtained from association headquarters in New York in the form of gummed stickers, window posters, window cards for stores and single, double and three-column mats for use in newspaper ads.

Many companies which used these posters last year state that they found it very easy to obtain the co-operation of merchants in this shop-early effort. Experience has shown that once it is made clear to the merchants that it is as much to their advantage as it is to the street car companies to scatter the traffic throughout the day, they are willing to lend their aid.

Special Reports Available

THE Bureau of Information and Service of the American Electric Railway Association announces that the following special reports have been prepared and are available to member companies in good standing upon request:

Customer and Employee Ownership of Electric Railway Securities: Gives summarized accounts of campaigns by exclusively electric railway companies to sell their securities to their employees and the local public, including data on amount of securities sold, number of new security holders obtained, methods of conducting campaign, samples of publicity work, cost of selling campaign and opinions of executives as to the benefits derived.

Transportation Service by Motor Bus Lines: Results of an investigation made to determine the kind of transportation service, if any, now being given in territories where electric railways have completely abandoned service.

Wages of Employees Other than Trainmen: Compilation based on the reports of about 175 companies showing their classifications of employees and the wages paid in their shop, carhouse, way and structure, power, overhead line and storage departments.

Series of Charts Illustrating Developments in Electric Railway Industry: Reproductions of charts first exhibited at the Atlantic City convention covering growth of electric railway riding habit, effect of automobile operations on electric railway traffic, recent trend of electric railway traffic and trend of revenues, expenses, wages and fares.

In addition to the above, supplements to the wage bulletin, fare bulletin and the cost of living studies have been prepared, bringing them down to date.

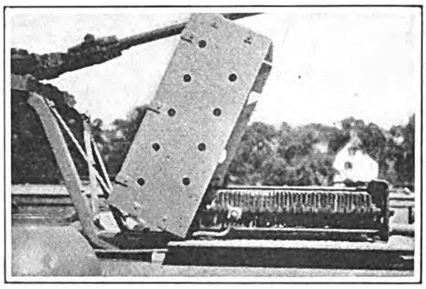
Maintenance of Equipment

Roof Mounting of Motor Resistors

BY H. T. HURLOCK
Engineer of Rolling Stock and Shops, Eastern Massachusetts Street Railway, Boston, Mass.

THE mounting of motor resistors beneath the car body is generally recognized as good practice and under ordinary conditions proves quite satisfactory. The single-truck Birney cars on this property, however, have been exceptions.

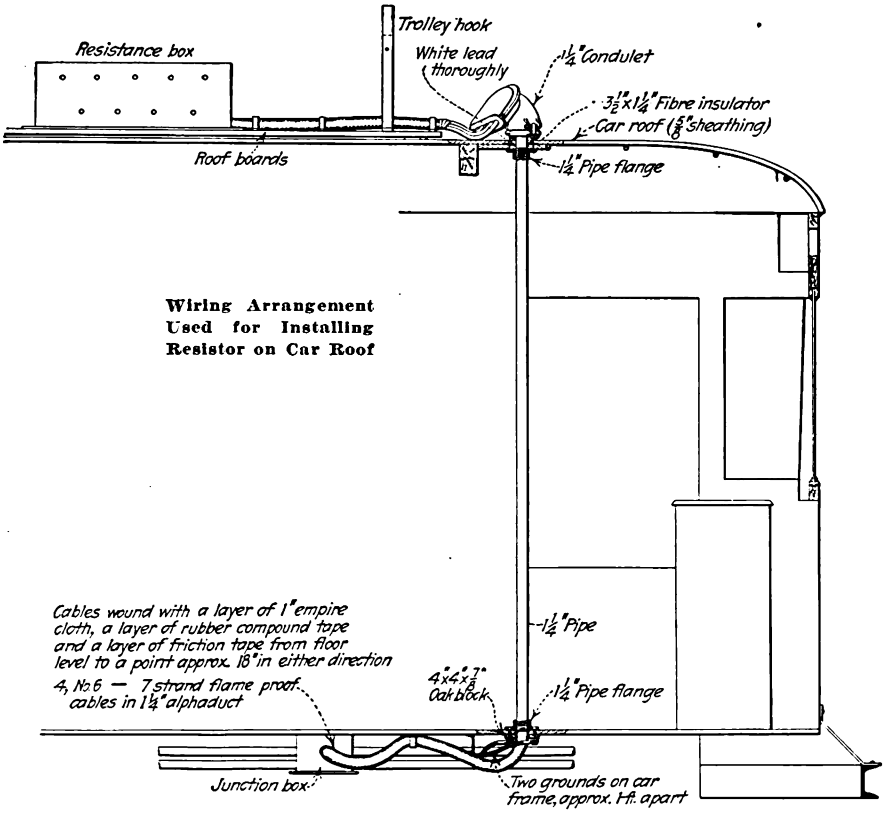
The only available location for the resistors on this type of car was under the platform, where the necessary protection against dirt and water could not be obtained even with a generous application of splash guards. During the winter, the undersides of these cars became thorougly saturated with water and a most careful installation did not prevent the frames from grounding. Because of low floors, the resistors were necessarily close to the street, and being located at the front end it was not uncommon to have the light-weight grids broken by stones or covered with ice and snow. Of the 154 Birney cars operated in the territory north of Boston during the winter season of 1922-1923, 84 were removed from service for resistance trouble, which constituted the largest cause for pull-ins on cars of this type.



Resistor Installed on Roof of Car

As a result, it was decided to locate the motor resistors on the roof. Five experimental cars were placed in service for several months, and the improvement shown was so great that plans are under way to make the installation on some 225 cars. To date 150 cars have been modified, and over an average period of six months there has been but one resistance failure and that due to breakage from vibration.

It was realized that an additional fire hazard was introduced by locating the resistors on the car roof. For this reason special precautions were taken to make the installation fireproof. The single frame is totally inclosed in a box of asbestos lumber, perforated with 1-in. holes for ventilation. The top and sides are held together by iron straps and hinged at the rear, permitting the box to be raised for inspection. The resistance leads are conveyed to the roof in a 1¼-in. iron conduit and brought out at the top through an inverted type condulet. The conduit itself is thoroughly grounded to protect passengers. It is separated from the roof condulet by a 1¼-in. fiber bushing. The arrangement prevents water from entering the conduit and at the same time eliminates the possibility of fire due to the trolley wire coming in contact with the metal roof condulet. Flameproof wire is used for the resistance leads.

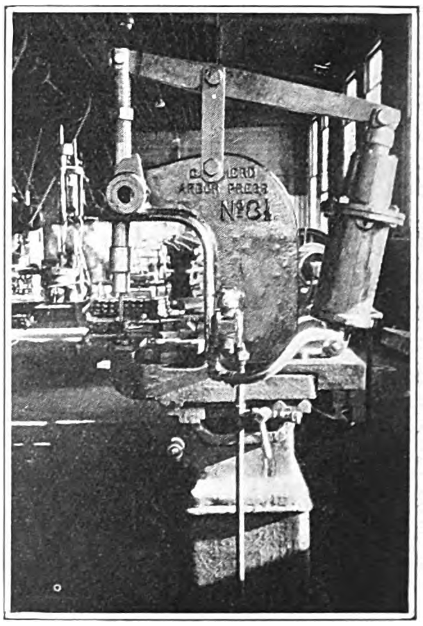


Trolley hook
Resistance box
White lead thoroughly
1¼" Condulet
3½"x1¼" Fibre insulator
Car roof (⅝" sheathing)
Roof boards
1¼" Pipe flange
Cables wound with a layer of 1" empire cloth, a layer of rubber compound tape and a layer of friction tape from floor level to a point approx. 18" in either direction
4, No. 6 — 7 strand flame proof cables in 1¼" alphaduct
1¼" Pipe
4"x4"x⅞" Oak block
1¼" Pipe flange
Junction box
Two grounds on car frame, approx. 1 ft. apart

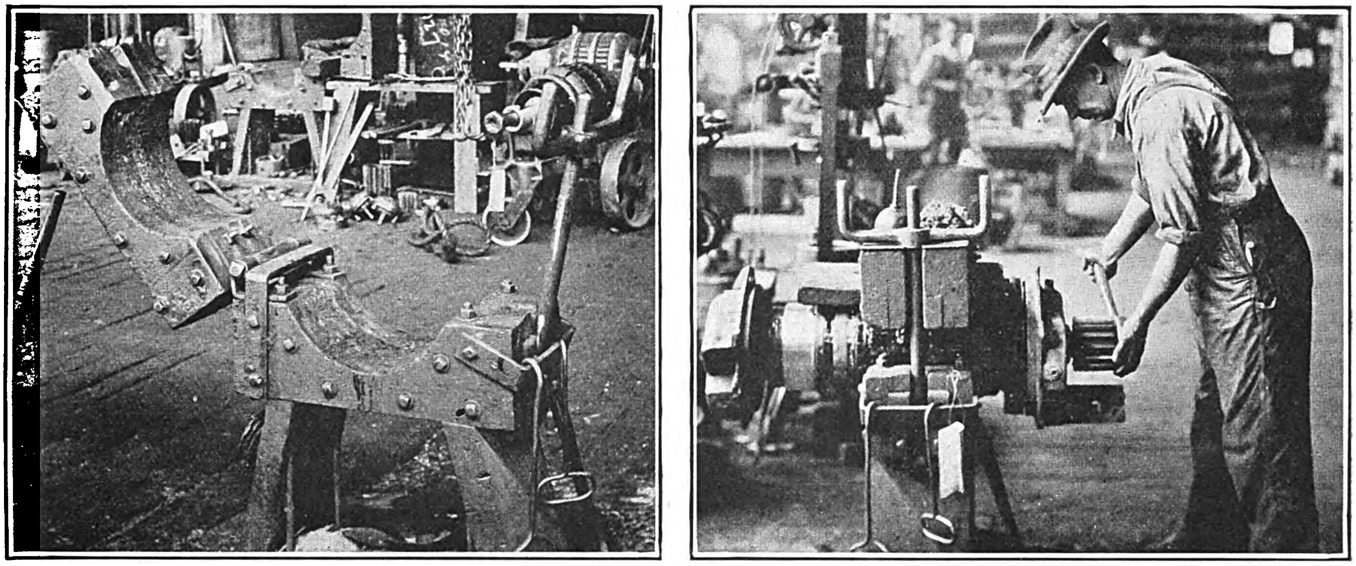
Wiring Arrangement Used for Installing Resistor on Car Roof

Air-Operated Arbor Press Makes Handy Shop Tool

AN OLD hand-operated arbor press, equipped with an air-operating cylinder in the mechanical department shops of the Twin City Rapid Transit Company, has been found to make a very handy ma-



An Old Brake Cylinder Mounted on an Arbor Press Makes a Very Handy Machine Tool in the Shops of the Twin City Rapid Transit Company



At Left—The Armature Clamp Is Hinged at One Side and Is Pulled Down Tight by Means of a Large Wing Nut. At Right—With the Armature Held Securely in the Clamp, One Man Easily Loosens the Nut or Removes Pinions Without Any Assistance

chine tool for a number of common electric railway shop uses.

This outfit is mounted on the end of the bed of a large lathe in the machine shop, where it is convenient for use on many of the jobs going through this department. The air cylinder is pivoted at the rear of the machine, and the power is transmitted to the spindle by means of an overhead lever. A large nut on the threaded upper portion of the spindle forms a stop and limits its travel to any predetermined amount.

For many drifting operations, such as that of drifting the holes in copper rail bonds, for pressing in and out brake-rigging bushings, and for other similar work, this simple home-made outfit has been found extremely useful and efficient.

Wood Clamp for Holding Armatures

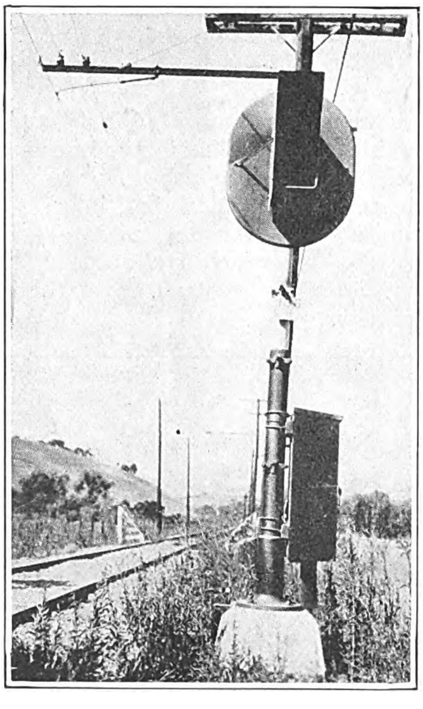
When it is necessary to loosen the pinion nut for removing the pinion on an armature, a split block is used in the shops of the Kansas City Railways to hold the armature securely, so as to insure against any damage from rubbing or other cause while the nut is being taken off. This is a very simple rig, but it avoids possible damage to armatures.

The block is shown in the accompanying illustrations, both in open and closed positions. It clamps down on the laminations, holds the armature securely, and does not damage the coils. By holding the armature in this way one man changes pinions without any assistance.

As shown in the illustration, the block is made up of heavy timbers formed for holding the armature between the two halves. For smaller armatures, a filler block is inserted to give the desired clamping effect.

Automatic Lamp Control Saves Power*

In sparsely settled territory along the route of the San Francisco-Sacramento Railroad there are numerous small shelter stations in the vicinity of which the company has no agent. In order that these stations should be adequately lighted when passengers are boarding or alighting from trains, it was customary to keep the lamps burning continuously. Recently, however, the railway has connected these station lamps to the block signal system in such a way that they are lighted only when the train is within 3 miles of the station coming or going. This has saved a considerable amount of power during the night when there are few trains on the line, and has also had a tendency to prolong the life of lamps. Similarly, the block signals themselves have been arranged so that they are now lighted only one block ahead of the approaching train.



On the San Francisco-Sacramento Railroad Signals of This Type Are Lighted Only in the Block Immediately Ahead of an Approaching Train

Testing Contactor Mechanisms

A convenient method of testing various parts of control contactor mechanisms has been worked out in the Wheaton shop of the Chicago, Aurora & Elgin Railroad with the result that irregularities in the contactor operation are discovered and remedied before the mechanism is placed in service. The apparatus consists of a rack from which hang the three types of stationary contactor parts used by this property, including the magnet coil, arc chute, and framework for receiving the movable mechanism. The magnet coils are hooked up in parallel and are connected to a 220-volt d.c. line from the shop switchboard. By means of a switch located on a board back of the test rack, any one of the magnet coils may be put in service.

---

*This article is based on material included in the brief submitted to the Charles A. Coffin Prize Committee of the American Electric Railway Association by the company named.

The mechanism to be tested is attached to the stationary coil in much the same manner as it would be under a car. By making and breaking the connection to the magnet coil, it is possible to "pick up" or "drop out" the contactor armature upon which is mounted the contactor tip. In case of failure to operate the necessary adjustments or repairs are made to the movable mechanism.

The supporting bracket is made of 1-in. x 1¼-in. steel held in position by a light framework at each end. Each stationary mechanism is labeled with the type of control system to which it belongs, thus facilitating the work of testing.

New Equipment Available

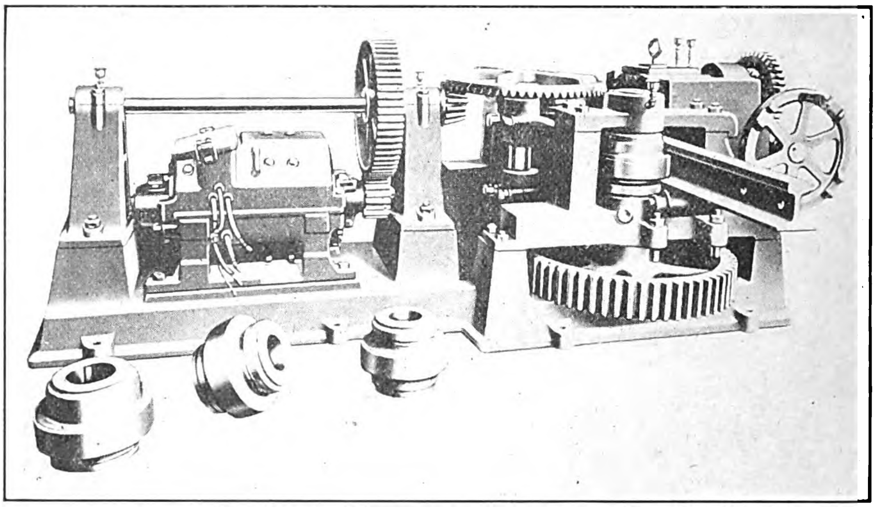
Improved Power Rail Bender

An improvement to its former type of power-driven rail bender has recently been put on the market by the Watson-Stillman Company, New York. This improved type apparatus will not only bend rails to any desired radius but it can be used also to straighten curved rails.

In operation three rolls fitting the section of rail are used. Two gear-driven feed rolls are spaced 32 in. apart center to center. The third or center roll is forced against the rail by two large screws operated by hand wheels, the position of this roll determining the curvature. The rails are passed back and forth between the rolls by using a reversible motor. In case the machine is belt driven the motion is controlled by a belt shifter with tight and loose pulley.

The frame of the machine is of open-hearth steel with cast-iron bedplate. Gears have cut teeth and are made of either cast iron or steel as desired. Rolls are cast steel. The roll shaft and gear shaft are of machinery steel.

Rails are passed through the machine at a speed of about 50 ft. per minute. T-rails require one set of three rolls. Guard or girder rails require one set of six rolls for each rail section. All rolls can be changed easily by removing the frame cap and one gear. Guards are furnished with the machine to conform to safety laws. The machine is built in two sizes, 75 tons and 100 tons. The larger size has sufficient power to curve or straighten any rail section now in use.

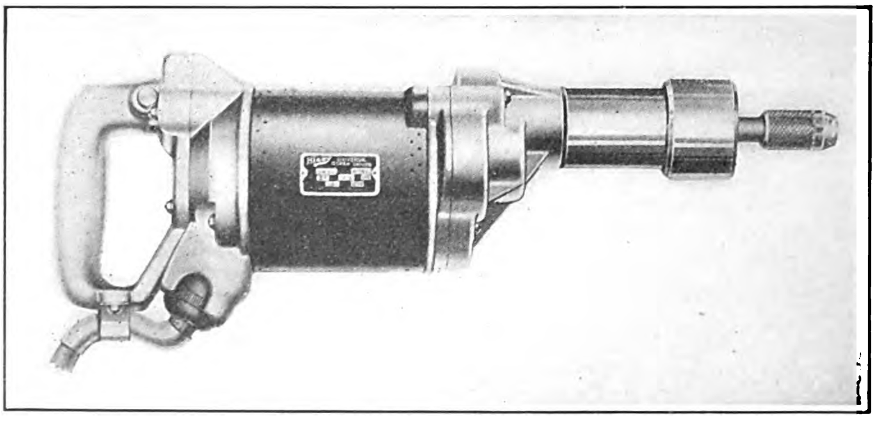


This Power-Driven Rail Bender Will Curve or Straighten Any Rail

Friction-Head Screw Driver

An improved electric screw driver is being offered to the trade by the Hisey-Wolf Machine Company, Cincinnati, Ohio. New features in the design include a disk-type friction clutch, which is automatically adjusted according to the pressure applied by the operator. The clutch casing is of convenient size and serves as a grip when the work requires. The device is equipped with ball bearings throughout and is provided with a universal motor for operation either on direct or alternating current.

This machine can also be used for setting up nuts, and standard nut sockets can be furnished in sizes of ¼ in., 5/16 in., and ⅜ in. for either square or hexagonal nuts. These are recessed for bolt clearance to a depth equal to twice the bolt diameter.



Electric Screw Driver with Friction Head

Light-Weight Insulating Board

To meet the demand for a light-weight low-cost insulating board with high dielectric strength, the Panelyte Company, Trenton, N. J., is placing on the market a new insulating material weighing only 74 lb. per cu.ft. This material is compounded of several well-known dielectric substances produced by nature, including cellulose fibers. It is not brittle and is easily drilled, tapped, sawed and polished. Panelyte has a black polished surface, which it is said is not affected by acids or oils. Sandpapering and rubbing with oil will produce a dull surface.

When ignited this material burns slowly. If left alone, the burning dies down and finally goes out without consuming the panel. It is claimed that the destructive effect of the burning does not penetrate all the way through the panel. Among the uses for which Panelyte is suited are controller backboard panels for switchboards, fuse blocks, exciters, converter panels, busbar supports and back-connected switches.

The News of the Industry

Compromise in Cincinnati

In New Traction Franchise Railways Make Concessions to City to Further Early Settlement

Surrender by the Cincinnati Traction Company and the Cincinnati Street Railway on six disputed proposals and compromise on two others, the compromise being in favor of the city of Cincinnati, is contained in the latest draft of a new traction franchise which will be submitted soon to the Mayor's citizen traction committee. Some of the conclusions of the conferees follow:

The Avondale and Bond Hill cars will continue to run to Fourth and Main, instead of only to Sixth and Main, as desired by the company.

The company agrees to pay half the expense of the upkeep of the city street car director's office, its share not to exceed $15,000 annually.

The company agrees to pay rental for viaducts, instead of only share expense of track and overhead maintenance.

The company agrees to eliminate the wage proviso in the 7½-cent fare guarantee for the initial three years.

The company agrees not to increase fares on owl cars.

The company relinquishes the proposal that on purchase of the properties by the city there shall be a 10 per cent premium on stock.

A compromise was effected in the matter of court costs and extension of the "rehabilitation" period so that it goes to Dec. 31, 1928.

The printed draft of the ordinance will contain the proposal that the company shall pay not to exceed $25,000 in any one year for street paving. But an alternative proposal is that the company shall share half of the expense of paving only on streets improved during or since 1920.

It was made plain by Walter A. Draper for the two companies and by City Solicitor Saul Zielonka that the changes and modifications were tentative and contingent. The companies make their concessions only on the consideration that the city accepts one or the other of the alternative paving proposals.

Rapid Transit Agitation Renewed in St. Louis

Mayor Henry W. Kiel is expected to be a candidate for re-election to a fourth four-year term on the rapid transit issue next spring so the administration is expected to speed through the preliminary survey. C. E. Smith, consulting city engineer, has very decided views on the city's rapid transit needs. He favors a system of subways downtown with feeder elevated lines reaching into the outlying sections of the city and its suburbs.

The special transportation committee in its report to the Board of Public Service recommended that a system of zone fares be worked out so that those outside the city who will benefit by rapid transit will have to pay part of the cost of building and maintaining the system.

The committee has recently repeated its former declaration that the cost of building a rapid transit system should not be laid at the doors of the car riders alone, but that private property which benefits should be assessed part of the costs as is done at the present time in street widening and paving projects.

The proposed rapid transit system for St. Louis would cost upward of $100,000,000. The city under a recently enacted state statute has ample authority to vote bonds for that purpose.

New Franchise Agreement Approved at Akron

Franchise Submitted to Direct Vote of Car Riders—Four Years of Operation Under New Fare and Other Conditions Proposed—Municipal Bus Plan Defeated

BY A VOTE of 28,682 to 24,872 the residents of Akron voluntarily took the traction issue out of politics Tuesday and gave to the Northern Ohio Traction & Light Company a new franchise for four years at a 7-cent cash fare, four tickets for 25 cents, or 17 tickets for a dollar. The new rate is to go into effect immediately. Express bus service is provided at a 10-cent fare. The company is given the right to use one-man safety cars, but they must be of double-truck design. No new railway extensions are provided, but the city has the right to order additional bus service amounting to the operation of 500,000 miles annually.

City officials, who by their refusal to grant the company an increased fare last February caused Akron to be without car service for four weeks, tacitly approved the agreement by keeping silent about it. They took no position for or against it officially, but by declining to oppose the agreement made it clear that they were not against it. In other words, the city administration maintained a "hands off" policy as did both of the leading political parties and one of the newspapers. One newspaper advised the people to vote against the franchise and another condemned the proposal and at the same time denounced the administration for failure to take a stand on the issue. Only one publication, a woman's magazine, bitterly opposed the franchise.

The franchise was submitted by the company through initiative petitions. More than 11,000 persons signed these petitions, although only 3,850 signatures were needed.

The company conducted its own campaign and appealed to the fairness of the public. Early in the campaign the company made its plea to the car riders and it may be said that it was the car and bus riders who voted for the proposal. The measure was opposed by independent bus operators, former jitney operators and by an organization known as the Car Riders' League. In its campaign the company paid no attention to attacks made upon it. All of the work done was carefully mapped out in advance and in no way did the company deviate from the course laid down. Election day was fair and a very heavy vote was polled.

The new franchise takes the place of the temporary contract made Feb. 27, following a period of 27 days when the city attempted its famous motorization scheme. The old 25-year franchise expired on Feb. 1 and the city attempted to compel the company to continue operation for a period of three or six months at the old 5-cent rate of fare, the voters more than two years ago having granted the company that rate, the old rate being on a 4-cent ticket basis. When the settlement came in February, a temporary agreement was made until Dec. 4 at a rate of 5 cents cash with a 1-cent transfer charge. If no new contract had been adopted at the general election, the temporary proposal provided a 6-cent cash fare from Dec. 4 until May 1, 1925, at which time the company was to discontinue operations, under order of the Council.

One feature of the new franchise which was assailed was the company's right to abandon car lines and substitute buses on streets to be paved or repaved. The company took the position that it could not reasonably be expected to make heavy capital expenditures under a 4-year contract. Another feature which met opposition was the provision eliminating competition on routes where the company now operates.

The city administration submitted a bus bond proposal at the same election. This proposal provided for the issuance of $3,000,000 of bonds for the purpose of establishing a municipal bus system in the city. The measure was defeated by more than 9,000 majority. Several other bond issues submitted at the same time were defeated with one exception.

Chicago Elevated Answers Mayor's Strictures

An answer to Mayor William E. Dever's recent implications that the Chicago Rapid Transit Company (elevated railroads) would be unable to procure money to build a subway if granted permission by the City Council was embodied in a page advertisement taken by the company in the seven Chicago dailies.

The ad was headed "A Record In Railroad Building." It outlined the construction records being made on the Niles Center extension of the rapid transit lines, pointing out that the work is already two-thirds completed and that the line will be in operation by Feb. 1, 1925.

Permission was granted on April 3, 1924, by the city of Evanston, in the limits of which the railroad is being constructed, it being the first suburb directly north of Chicago. Therefore the railroad construction work will have consumed only ten months time.

In the center of the advertisement an editorial was reproduced which had been published in the Chicago *Tribune*, leading morning paper, berating the city's lassitude in subway matters. The editorial was headed "Laugh, Darn You, Laugh." It is considered a very good one from the point of the railroad. Part of it follows:

> The elevated rattles around in downtown Chicago, depreciating property values, an offense to the eye, and an outrage to the ear. It is the only approach to rapid transit we have, and no doubt as good as is can be made with the limitations placed upon it.
>
> When Mr. Insull begins to build outside the Chicago limits he deals with a municipal corporation which belongs in the year 1924. He is allowed to come down off stilts and get underground. He must wait until he escapes from Chicago before he is allowed to consider the general good of the community, the values of adjacent property, the possibility of giving real rapid transit to his passengers, or any of the requirements of modern metropolitan transportation.
>
> Let's try and laugh this off. Evanston has a subway. The Chicago elevated is in it.
>
> Will Evanston take us in? Or should we apply at Dunning?

Incidentally, it should be mentioned that Dunning is the site of the Insane Asylum for Cook County, in which Chicago is located.

The advertisement was illustrated with six pictures of recent steps in the construction of the extension, and the text described several of the difficult engineering problems which were encountered in the construction work. In speaking for the company Luke Grant said:

> It is the policy of the company to answer any statements of politicans regarding our affairs, whenever possible. In this case we attempted to show that we have already proved our ability to accomplish construction, similar, in a way, to that proposed in Samuel Insull's plan for a subway in Chicago.

Trackless Trolley Installed in Cohoes

A test was made by the United Traction Company, Albany, N. Y., on Nov. 1 of the trackless trolley installed by that company in the city of Cohoes. The installation was made by the Capitol District Transportation Company, a subsidiary of the United Traction Company. The plans of the company called for the use of four vehicles at the outset. The route over which the new equipment will be run is known as the Belt Line. The period of the franchise applying to the trackless trolley route is four years. It is stipulated that fares on the trackless lines are not to exceed the rate charged on the other lines of the company. Among the manufacturing companies that contributed to the installation were the Brockway Corporation, the General Electric Company and the Wason Manufacturing Company.

Will Await Decision on Interstate Bus Companies

Decision as to the right of interstate bus companies to operate in Massachusetts without a license from local authorities, which has been asked of the Attorney-General of that state from a score of towns and cities, will depend largely on the decision in the case of Buck vs. Kuykendall, which is due to be argued before the United States Supreme Court on Nov. 10. Attorney-General Benton of Massachusetts says he considers the transportation issue on this point so vital that he will withhold his decision pending developments in the Supreme Court case and will go to Washington to hear it argued.

The Massachusetts Department of Public Utilities has also decided to enter this case and will be represented in a brief to be filed by John E. Benton, general solicitor of the National Association of Railroad and Utility Commissioners. The national association, which is composed of the state commissions, will take the attitude in this case that until Congress acts in the matter the various states may exercise regulatory power over bus lines operating over highways including those operating interstate, and that such regulation incidentally affects and does not unduly burden interstate commerce.

Chairman Henry C. Attwill of the Massachusetts commission says in his instructions to the general solicitor of the national association that every effort should be made to sustain the proposition that the state have jurisdiction to regulate motor vehicles running from one state into another state.

The case now before the United States Supreme Court grew out of the petition of a bus line for a license to operate a bus between the state of Washington and points outside the state. The Department of Public Works of Washington denied the petition on the ground that there was a bus line already in existence operating under a previous permit. Mr. Buck appealed that case to the federal court seeking to enjoin the state officials from interfering with the operation of his proposed line. The lower court denied the injunction and ordered the bill in equity dismissed, whereupon Mr. Buck appealed to the Supreme Court of the United States on the point that interference by state authorities with interstate commerce is in contravention of the commerce clause of the federal constitution.

Whatever the decision by the Supreme Court, it will affect all state commissions, and if the issues are similar to the issues which have been raised in Massachusetts regarding the bus lines that operate from various Massachusetts cities to Providence, R. I., it will determine the course for those cases.

At present the lines in Massachusetts maintain they can operate from state to state without any license from local authorities.

Increased Service in Indiana

A complete change in schedules, providing for more fast through cars between Fort Wayne and Indianapolis, about 120 miles, will go into effect shortly on the Indiana Service Corporation and Union Traction of Indiana lines, according to an announcement of local officials of the corporation. The main feature of the schedule change will be the establishment of six new fast trains to be known as the Hoosierlands and Wabash Valley Fliers. These cars will make the entire distance of the trip in four hours. These cars will augment the existing schedule, which calls for the operation of two fliers on each division daily. An equal number of fast trains will be started from the Indianapolis end of the system, providing fast through service at practically all hours of the day. Other changes will be made in the schedule to make possible better traction connections to all parts of the Middle West.

Ten Killed in Chicago Grade Crossing Accident

Ten passengers were killed an two score injured, some seriously, early on Nov. 2 when a Chicago, Milwaukee & St. Paul Railroad freight train, backing into the yards, wrecked an electric street car crossing the tracks. Most of the victims were neighbors returning from a Hallowe'en party.

Contracts for Use of Indianapolis Terminal Facilities Hold

The petitions filed by the Cincinnati, Indianapolis & Western Railroad against the Indianapolis Union Railway asking that the plaintiff's contracts be rescinded with the Indianapolis company for use of its terminal facilities at Indianapolis were dismissed for lack of equity in an opinion given by Judge Hickenlooper in United States District Court at Cincinnati. In his opinion Judge Hickenlooper said that for two years after entering into the contract the plaintiff paid rentals under the contract. He held that, while the law provided relief for a mistake of law or fact, proceedings to rescind must be begun immediately.

The petitions were originally filed in the foreclosure suits of the Central Trust Company and Equitable Trust Company, New York, as trustees under mortgages against the Cincinnati, Indianapolis & Western Railroad, and sought to have rescinded contracts for use of terminal facilities. The railroad was to pay two-thirteenths of the fixed rental for its use of the terminal. The plaintiff alleged that when it purchased the property of the Cincinnati, Indianapolis & Western Railroad in 1914 it agreed to only one contract regarding the use of the terminal.

Buses Supplant Maumee Valley Line

The Maumee Valley Railway, Perrysburg, Ohio, ceased operating cars at midnight on Nov. 1, and early the next morning the Maumee Valley Transportation Company, a subsidiary of the railway, put a fleet of seven Fageol coaches in operation over the former traction route. Five of the coaches are equipped with wicker chairs and two are of the street-car type for use at rush hours. The interurban station at Toledo is used.

The company has not yet received permission to operate on the west side of the Maumee River between Toledo and Maumee, but it is expected that the State Public Utilities Commission will authorize the company to use the old belt line as territory for the new bus line.

Rails, poles and other equipment of the railway will be removed and sold. The railway operated seven passenger cars over 23 miles of line.

North Shore Transports Students to Automobile Plant

The Chicago, North Shore & Milwaukee Railroad recently carried 140 students of Lane Technical High School, Chicago, to Kenosha, Wis., for a trip through the Nash Automobile Company plant. Britton I. Budd, president of the North Shore Line, in order to increase the interest of the high school students in their trip, offered a gold watch as a prize for the best descriptive essay on the trip. The boys were picked up by a North Shore train at a station directly adjacent to their school and professors in charge of the tour were high in their praise of the service rendered by the company. At the Nash plant a short talk had been arranged for the high school students by the city manager of Kenosha.

Boston & Maine Will Study Truck and Bus Transportation

The Boston & Maine Railroad, Boston, Mass., has announced the establishment of a department to study the subject of motor truck and bus transportation. Special attention will be given to the study of motor transportation, both passenger and freight, as related to the Boston & Maine traffic by Howard F. Fritch, formerly assistant general manager of the Eastern Massachusetts Street Railway. Frank I. Hardy will represent Homer Loring, chairman of the executive committee, in various investigations. Mr. Hardy was formerly manager of the Chelsea division of the Eastern Massachusetts. Both these newly appointed assistants to Mr. Loring were referred to in the ELECTRIC RAILWAY JOURNAL of Oct. 25.

According to the statement from President Hustis of the Boston & Maine, the work to be undertaken is of great significance. The inroads of motor competition in Boston & Maine territory have been constantly growing. The result of the question in some sections is whether the railroad or motor truck can best serve the territory. He believes it is apparent that in certain fields both agencies cannot be continued and that either one or the other must prevail. He said further that the problem was not necessarily one of competition, but involved the elimination of expensive duplication and the adjustment of both forms of transportation to a logical and permanent basis.

Stunned by Injustice, Boise Railway Is Ready to Quit

Discontinuance of city service by the Boise Valley Traction Company is considered probable, should the City Council grant a 10-cent bus franchise. W. R. Putnam, vice-president of the railway, has written to Mayor Sherman pointing out the injustice of the proposal. He says in part:

> The owners of these properties could have no other conclusion when a 10-cent bus franchise is granted than that street car service, at a cost considerably less than bus service, is not desired, and therefore would be warranted in taking steps to discontinue city street car service.
>
> At present 90 per cent of the fares paid for city service are 5 cents, and the average fare paid by all city riders is less than 5¼ cents. We have been quite interested in the situation that has developed, namely, that some of the very people who have objected to our receiving an average fare in excess of 5¼ cents are now advocating a 10-cent fare for other types of transportation. This is of particular significance when one considers that the installation of buses in the city presumably means that street cars in Boise are considered a thing of the past and their operation will be shortly abandoned.

Station Plans Announced for North Shore Line

Developments announced recently on the Niles Center extension of the Chicago, North Shore & Milwaukee Railroad, over which trains of the Chicago Rapid Transit Company will be operated for a distance of 5½ miles, are the announcement of the plans for the stations and the laying of the first sections of permanent track.

The stations are of three types, directly above the tracks where the road is in the open cut; below the tracks where the road is elevated; between the tracks on the surface. There will be a large terminal station.

Granite terra cotta, steel, concrete, art marble and tapestry brick are among the materials to be used in the construction. Beauty of design is embodied in the station plans, in order that they may harmonize with the suburban surroundings of the territory served.

Engineers in charge of construction maintain that they will have trains running early in January, 1925, their original schedule. If they do it will constitute a record in railroad construction. Details of some of the construction problems were outlined recently in the ELECTRIC RAILWAY JOURNAL.

New Agreement in Fostoria

A wage and working agreement was recently reached between the union and the Toledo, Fostoria & Findlay Railway, Fostoria, Ohio, after several conferences at which were present Elmer Smith, general manager of the line, and H. Lee Camp, business representative of the union, and a committee representing the employees. Under the agreement conductors and motormen on passenger cars are to receive 47 cents an hour for the first year in service, 49 cents an hour for the second year, and 52 cents an hour thereafter. Freight car crews are to receive 2 cents an hour above that schedule in the three classifications. No run is to pay for less than the 10-hour minimum day. No change was made in the wages of shopmen, but improved working conditions were provided.

The Toledo, Fostoria & Findlay is about to take over the Fostoria & Findlay line. In the event of the consolidation the new agreement is to cover the men on that line. The contract is operative from Oct. 1, 1924, to Oct. 1, 1925. There is a plan for an agreement between the various interurban lines in that section of the state to establish through service between principal points on the various lines. In that event the new agreement provides that the men on the Toledo, Findlay & Fostoria line are to get 50 per cent of operations north of Findlay.

Change in Boston Fare Made Nov. 5

The 6-cent fare did not go into effect on the Boston Elevated System on Nov. 1 as first planned. Owing to the amount of detail involved in preparing for the change, the increase from 5 to 6 cents was withheld until Nov. 5. On the bus lines the introduction of the 6-cent fare will be gradual, as the buses come under the jurisdiction of the city and town authorities, by whom they were licensed to operate at a stipulated fare unit.

Indiana Company Will Transport Coal

Transportation of coal by traction will be inaugurated for the first time in Indiana during the coming year, if plans now being formulated by officials of the Interstate Public Service Company, Indianapolis, Ind., materialize. It is the plan of the company to begin transportation of coal from the Ohio river landings to Indianapolis in large volume early next year. This, it is understood, will mean a substantial reduction in transportation costs between the coal fields of West Virginia and western Pennsylvania and Indianapolis, part of which may be reflected in lower fuel prices to the consumer.

In order to enter this field the Interstate, Bert Weedon, traffic manager of the company, said, would purchase 100 new gondola coal cars and make necessary improvements at the Ohio River, such as running of switches along the riverfront and installing loading equipment at the docks, all of which may entail an expenditure for equipment and trackage of approximately $300,000.

Little Rock's Service Better.—In accordance with the recommendations made by Ross W. Harris, traffic expert, recently employed by the city of Little Rock, the Arkansas Central Power Company has made changes in its tracks and lines which are helping to solve Little Rock's traffic problems and giving better service to the patrons.

Bureau Opposed to Jitney Competition

The Board of Commissioners of Charlotte, N. C., recently passed an ordinance requiring definite routes and schedules to be maintained by buses and the posting of indemnity bonds of $5,000 each. This action was taken for the "sake of the safety of the public." The commissioners reserve to themselves the power to revoke the license wholly or in part whenever in their estimation the buses as operated are unduly interfering with the use of the streets by the public or traffic rules and regulations are violated or when the schedules as outlined are not followed. The North and South Carolina Public Utility Information Bureau has recently expressed some concern over the jitney competition which seems to be prevalent throughout the states of North Carolina and South Carolina. It feels that Charlotte in regulating her buses has taken a step which should be followed by other larger municipalities in the state. It calls attention to the fact that in Asheville, N. C., the unregulated jitney is jeopardizing the street railway, with the public indifferent enough to deny protection to the company's franchise.

New Tariff Increases Rates

The Syracuse & Eastern Railroad, operating lines to Fayetteville and Manlius from Syracuse, N. Y., has been granted permission by the Public Service Commission to increase its cash rates from 3 to 3½ cents a mile and for ticket fares from 2 to 3 cents a mile, with an increase in 50-trip commutation tickets from 1½ cents to 2 cents a mile. The minimum cash fare will be 7 cents and the minimum ticket fare 9 cents. The new tariff became effective on Oct. 20. Harvey D. Gross, general manager of the company, explained that the increase was sought because he was convinced that the public would not ride in cars in any greater numbers solely because of lower fares. He said that the fare was decreased in 1921 to 6 cents, with the view that people would give greater patronage; that the rates had not been changed since then, but that the extra number of passengers had not increased materially. The company operated at a loss in 1923 and the profits this year so far have been small. The company is making an effort to induce commuters to use the line. These will benefit by a rate of 2 cents a mile, with the 50-trip ticket selling for $4 instead of $3.

Orders Service Continued

Modifying a previous order, the New Jersey Board of Public Utility Commissioners has directed that trolley service be continued by the Trenton & Mercer County Traction Corporation to the northern limit of Pennington. Early in August the board granted permission for the abandonment of service at a point near the center of the town. Pennington residents objected to half of the town being without trolley service.

Substitution of buses for cars on the Hopewell branch of the Trenton & Mercer County Traction Company between Pennington and Hopewell was authorized some time ago by the Board of Public Utility Commissioners of New Jersey. The commission pointed out that the trolley line showed an operative deficit of more than $7,000 for the last year. Testimony was offered that the county purposes to pave the streets in Pennington and Hopewell over which the tracks run, insisting upon the installation of modern tracks, the estimated cost of which would have been more than $50,000.

News Notes

Invites Criticism.—Seeking better to serve the patrons on the various bus lines, S. S. Crane, general manager of the Logan Valley Bus Company, a subsidiary of the Altoona & Logan Valley Electric Railway, Altoona, Pa., is distributing questionnaires to the patrons urging them to make constructive suggestions.

Electric Railway Planned.—It is reported that plans for the construction of a $2,500,000 electric railway between Manitowoc and Sturgeon Bay have been announced by C. D. Smith of Fond du Lac, president of the Wisconsin Southern Railway, and C. V. Sheldon, chief engineer. The contract for the project is reported to have been awarded to the Ed Shuster Construction Company.

Authorizes Fare Increase. — The Maine Public Utilities Commission on Nov. 1 rendered its decision on the application of the Bangor Railway & Electric Company, Bangor, Me., for permission to increase its fares on all lines from 7 to 10 cents. A protest against the increase was made on behalf of the University of Maine students, many of whom live in Bangor.

Bus Line Asked.—The Los Angeles Railway, Los Angeles, Cal., has filed an application with the State Railroad Commission for permission to run a bus line from San Pedro Street and Florence Avenue to Florence and Pacific Boulevard. The north half of Florence Avenue is in the city of Huntington Park. The city trustees of Huntington Park have been notified of the proposed new service.

Changes Made in Fare.—The Public Service Commission has approved the fifty-four-trip monthly commutation ticket fare of $25 on the Olean, Bradford & Salamanca Railway between Olean and Salamanca. The fifty-four-trip commutation ticket fare of $24.50 between Olean and Killbuck was canceled. The changes are effective Nov. 28.

Wants Suggestions on Operations.—C. D. Smith, general manager Beaver Valley Traction Company, New Brighton, Pa., has sent out a circular to all employees soliciting suggestions relative to the operation of the road. Employees of the Beaver Valley Traction Company and the Pittsburgh & Beaver Street Railway are included in the program, whereby suggestions are to be submitted to William A. Coyle, chairman of the committee on suggestions, subsequently to be considered for prizes, which are offered every three months. The prizes vary from $1 to $75. The suggestions can apply to any part of the property of the Philadelphia Company and affiliated corporations, including the Pittsburgh Railways.

P. R. T. Carriers Successful.—The demand for the P. R. T. carfare carriers has far exceeded the supply, 65,000 having been sold from Oct. 30 to Nov. 2. The company is making every effort to renew its supply in sufficient quantity to meet the need. On Nov. 10 distribution of carriers on the cars will be resumed. These token carriers were referred to in the ELECTRIC RAILWAY JOURNAL, issue of Nov. 1.

Plans Faster Interurban Service.—In its plan to cut from 20 to 30 minutes from the running time of its present interurban service out of Milwaukee to Watertown, East Troy, Burlington and intermediate points, the Milwaukee Electric Railway & Light Company, Milwaukee, Wis., has purchased land for rights-of-way in the towns of Lake and Wauwatosa, thus avoiding the longer route now used through West Allis. A cut-off is under contemplation to speed up the Racine and Kenosha service.

Minimum Fare of Ten Cents.—The Gardner & Templeton Street Railway, Gardner, Mass., has abolished the 5-cent zone fare collection system and put into effect a minimum fare of 10 cents. The new fare affects the employees of an industry in Templeton and another in East Templeton and residents between Johnson's Switch and West Gardner Square on Parker Street, who have been riding for 5 cents.

Abandonment Hearing Deferred.—A hearing will be held on Nov. 15 before the California Railroad Commission, when the towns of Chula Vista and National City will present their reasons for their opposition to the application of the San Diego Electric Railway for permission to discontinue railway and bus service between National City and Chula Vista. The railway is seeking to abandon service because operation in these parts is a losing proposition. Until a final ruling is made railway and bus service will be continued by the company. The commission heard evidence submitted by the company on Sept. 12 to show that the car and coach services failed to meet expenses.

Jitneys Again in El Paso.—Jitney competition has aroused public ire in El Paso, Tex. The El Paso *Herald*, under recent date, stated its desire to hear from readers the reasons why jitneys should be allowed to operate again in the city of El Paso. The item compared jitney operation with railway operation, with the argument strongly in favor of relegating the jitneys off the streets of the city, and concluded by saying that Mayor Dudley would have the backing of all the people if he would take the necessary steps to break up the jitney competition "that is just now beginning to become a real menace." Jitneys ceased operating in El Paso on April 30, 1923, following the enactment of an ordinance. Another Texas city where jitneys have been ruled out is Fort Worth. The Supreme Court of Texas at Austin handed down a decision on Jan. 24, 1924, declaring valid the city ordinance prohibiting the operation of jitneys within the Fort Worth limits. The jitney operators had previously secured a temporary injunction against the enforcement of the terms of the ordinance.

Greater Use of Bus Recommended at Toronto.—After a survey of the transportation system in Toronto H. S. F. Langsdown, traffic superintendent of the London General Omnibus Company, has stated that the city is ready for omnibus service paralleling the electric railway lines in the downtown districts. Mr. Langsdown said that instead of taking traffic from the trolleys, the new mode of transportation would encourage motorists to leave their cars at home and ride downtown in a bus. He suggested that the buses be used in the surrounding country on Sundays and holidays. The railway in Toronto is municipally owned and operated.

Safety of Operation to Be Discussed.—Charles Hansel of New York city, consulting engineer of the Pennsylvania Railroad, the Philadelphia & Reading system, the Central Railroad of New Jersey and a member of the presidents' conference committee representing all the rail lines of the country, is in Buffalo, at the invitation of Herbert G. Tulley, president of the International Railway, for consultation in matters affecting the operation of the local and interurban lines. The purpose is to determine if it is desirable to rearrange any conditions respecting the safety of operations. Mr. Hansel is thoroughly familiar with the properties of the International Railway and, at the request of President Tulley, he made a report in July, 1923, suggesting some minor changes, all of which were promptly made by the International Railway. Special attention will be given to the Buffalo-Niagara Falls high-speed line division of the International since the Oct. 19 wreck at Ellicott Creek crossing.

Supplement for Business Purposes.—"Current Topics" will hereafter carry a supplement with reliable and specific information to the employees and officials of the Illinois Power & Light Corporation and its allied companies as to the products of the industries in the various cities served by them. By this move it is hoped to "turn business to the industries in our territory." In the November issue a Topeka supplement is published, telling in detail of this pioneer city of Kansas.

Wants to Extend One-Man Service.—The Milwaukee Electric Railway & Light Company, Milwaukee, Wis., has applied to the Railroad Commission for authority to extend its one-man car service to its Walnut Street line, which passes through the downtown section of the city into the northwest section of the city. The company is now operating one-man cars on three other lines in the city.

Allowed to Operate Ten Buses.—Five decisions granting permission to the Central Transportation Company, a subsidiary of the Trenton & Mercer County Traction Corporation, Trenton, N. J., to operate ten buses in Trenton have been handed down by the Board of Public Utility Commissioners of New Jersey. These buses are already being operated under city ordinances, but since they parallel the same streets with trolley tracks approval had to be given by the state body. The company has also been authorized to operate a bus between Trenton and Allentown.

Appleton-Sheboygan Bus Service Started. — The Wisconsin Traction, Light, Heat & Power Company has commenced the operation of its Appleton-Sheboygan bus service. Connections will be made at Sheboygan with the trains of the Milwaukee Northern Railway, an electric railway operating on an hourly schedule to Milwaukee.

Rerouting Plan Proposed.—A comprehensive plan for the rerouting of the car lines of the United Railways & Electric Company serving northwest Baltimore has been prepared by the transportation bureau of the Public Service Commission and sent to the United Railways for study. The plan was prepared by Ben Haughey of the commission staff.

Opposes Bus Line. — The Cincinnati Traction Company, Cincinnati, Ohio, has filed a protest with the Ohio State Public Utilities Commission against the application of Walter King and William McDaniels for authority to operate a bus line between Lebanon and Cincinnati. The traction company asserts that service between the two places is already adequate.

Will Run One-Man Cars. — General Manager D. W. Harvey of the Toronto Transportation Commission, Toronto, Ont., has stated that one-man cars will be operated on a 10-minute schedule on the York Township car lines. He also confirmed the previous announcement that tickets would be sold on the township cars at the rate of 11 for 50 cents.

Buses to Continue Operating.—The City Council of Oskaloosa, Iowa, granted another 90 days to the Oskaloosa Traction & Light Company for operating buses instead of street cars over certain sections of the city. The trial period for bus operation was referred to in the ELECTRIC RAILWAY JOURNAL, issue of Aug. 2.

Will Soon Operate One-Man Cars.—One-man cars will be placed in service on the Clinton division of the Clinton, Davenport & Muscatine Railway, Davenport, Iowa. The bodies of the cars were made in the Rock Island shops.

Bus Service Extended. — Extension of the River-Bayside Street bus service to Thirty-fourth and Kromer Streets, in Everett, Wash., as an experimental service will be started immediately by the Puget Sound International Railway & Power Company, under the direction of C. C. Coates. The extension is the second since the first of the year and is another step the company announces, in its desire to cover the city with transportation as fully as possible. Continuance of the service is contingent upon support by the public and safety of operation. The need of some sort of service to this district has long been outstanding. The buses will furnish 18-minute service.

Awaiting Wage Decision.—Trainmen of the Middlesex & Boston Street Railway, Newtonville, Mass., are awaiting a decision in the recent arbitration proceedings. The 350 carmen are demanding 70 cents an hour for a working day of 8 hours, the present scale being 55 cents an hour for a working day of 9 hours. Early in the present year the men were granted an increase of 4 cents an hour, the award being retroactive to July 1, 1923, and to continue in force until June 30 of the current year.

Railway Wants Relief.—The Chickasha, Okla., City Council is attempting to find ways and means to co-operate in securing continued car service for Chickasha. A letter from C. F. Woodworth of Wakefield, Mass., treasurer and general manager of the Chickasha Street Railway, advised the Council that the company was operating at a loss and would be compelled to discontinue service unless substantial relief measures could be adopted. An 8-cent fare, a substantial reduction in taxes and a lower power rate for electricity are suggested as three needed measures of relief. The City Council is believed to be anxious to co-operate and has asked the Chickasha Gas & Electric Company to consider the possibility of reduced power rate. It is stated that the road has paid no bond interest this year and has had a net loss from operation.

St. Louis Survey Planned.—The survey of rapid transit engineering and financial methods to be made under the direction of President E. R. Kinsey of the St. Louis Board of Public Service will require probably nine months' time. C. E. Smith, consulting engineer for the city, will do most of the work and will be assisted by men from his own office and certain members of Mr. Kinsey's staff. Compilation of data as to plans followed in other cities will come first. It will also be necessary to make a survey to ascertain what sewer, water, cable and gas lines will be affected by the proposed subways.

Wages Increased Two Cents.—An increase of 2 cents an hour in the pay of employees of the Rochester, Lockport & Buffalo Railway, Buffalo, N. Y., was granted on Oct. 30 following a lengthy conference between James Largay, vice-president of the street railway union, and W. W. Foster, president of the railway. The new wage became effective on Nov. 1. Trainmen were receiving 53 cents an hour and were seeking 57 cents.

Bonus Awarded for Safety.—Trainmen of the Nashville Railway & Light Company, Nashville, Tenn., were paid $3,980 in bonuses for the first eight months of 1924, because accidents were reduced. Thirty-four motormen and operators on Aug. 31 had gone throughout 1924 without one accident and without failing to attend a single safety meeting by the company in the interest of accident prevention. Both of these accomplishments are the objectives of the bonus awarded every four months by the company.

Financial and Corporate

Net Falls Off

Third Avenue Railway Reports a Decrease of $226,014—Will Provide Bus Service If Necessary

For the fiscal year ended June 30, 1924, the operating revenue of the Third Avenue Railway System, New York, N. Y., was $14,649,265, an increase of $242,481 compared with the fiscal year ended June 30, 1923. This statement was contained in the recent report of S. W. Huff, president, to the stockholders of the company. The operating expense was $11,173,480, an increase over the previous year of $446,496. The increase in expenses was greater than the increase in receipts, due to several causes, especially to the increased traffic congestion in the streets, resulting in the slowing up of service and the increase of accidents.

Mr. Huff said that the increase in congestion on the streets was making it more difficult to render an attractive service and was adding to the cost of operation. He stated that from data collected by his company at a number of traffic points it was shown that it took from five to seven times as much street space to pass a single passenger through the streets by means of automobiles and taxicabs as was required to pass them in street cars.

On the question of bus operation the report stated that there was unquestionably a field for bus operation, and at the present time there was a desire on the part of the public to ride in buses. President Huff said there were streets in which travel was not sufficient to justify the installation of electrical equipment, or where, for other reasons, such installation was undesirable, where buses could operate more satisfactorily and where the public was willing to pay for the increased cost of bus transportation. He said that such bus operation could be made more efficient and serviceable to the public when co-ordinated with existing trolley lines.

President Huff said it was interesting to note that today the electric surface lines of the greater city of New York were carrying a larger portion of the total number of passengers carried on surface lines, elevated lines and subway lines than they had since subway lines became a big factor in the transportation of the city. The use of surface car lines in recent years has increased faster than the use of subway and elevated lines. During the fiscal year ended June 30, 1924, more than 42 per cent of all the passengers carried by subway, elevated and surface cars were carried on the surface cars of the city.

He said that considering the present bus agitation the directors felt it was their duty to the security holders to make application for franchises for a bus system, to be operated in co-ordination with the electric lines; that the plan generally is to charge a 10-cent fare on the buses and to give free transfers to the electric lines. He said that the company had changed its motive power from the horse to cable, and from cable to electricity as the efficiency and desirability of each class of motive power was developed, and to the extent that buses are desirable as a supplement to electric car operation or as a substitute for it the directors of the Third Avenue Railway felt that they should offer them to the public.

The consolidated statement of income for the years ended June 30, 1924 and 1923, is contained in the accompanying table.

THIRD AVENUE RAILWAY COMPANY AND CONTROLLED COMPANIES YEARS ENDED JUNE 30, 1924 AND 1923

Operating Revenue:	1924	1923
Transportation	$14,232,952	$14,008,415
Advertising	150,000	150,000
Rent of tracks and terminals	25,649	26,005
Rent of buildings and other property	175,577	174,695
Rent of equipment	52,610	34,551
Sale of power	12,474	13,117
Total operating revenue	$14,649,265	$14,406,784
Operating Expenses:		
Maintenance of way and structures	$1,829,554	$1,425,233
Maintenance of equipment	1,523,495	1,334,189
Depreciation accruals	206,142	733,347
Power supply	1,090,857	1,223,968
Operation of cars	4,959,323	4,574,373
Injuries to persons and property—expended	1,165,882	1,074,590
Injuries to persons and property—reserved	*202,630*	*203,513*
General and miscellaneous expenses	600,855	564,794
Total operating expenses	$11,173,479	$10,726,984
Net operating revenue	$3,475,785	$3,679,800
Taxes	988,048	968,044
Operating income	$2,487,737	$2,711,756
Interest revenue	276,603	287,348
Gross income	$2,764,340	$2,999,104
Deductions from gross income:		
Interest on first mortgage bonds	$548,080	$548,080
Interest on first refunding mortgage bonds	879,620	879,620
Interest on adjustment mortgage bonds	1,126,800	1,126,800
Track and terminal privileges	14,231	14,524
Miscellaneous rent deductions	8,248	7,782
Amortization of debt discount and expense	21,870	21,315
Amortization of limited franchises	9,355	10,904
Sinking fund accruals	33,480	33,480
Miscellaneous	47,392	55,322
Total deductions	$2,689,078	$2,697,829
Net income	$75,261	$301,275

New Orleans Earnings Sufficient to Care for Interest Obligations

The report of the New Orleans Public Service, Inc., for the twelve months ended Sept. 30, 1924, gives the net operating income of the company at $3,466,603 for the year, a gain of $119,236 over the preceding year. The rate base of the company, upon which it is allowed a rate of return of 7.5, increased from $52,939,371 to $55,242,089, or approximately $2,203,718. This resulted in a decline in earnings to 6.48 per cent, as compared with 6.61 for the twelve months ended Sept. 30, 1923. The outstanding obligations of the company are only about 6 per cent of the rate base, which will make its earnings of 6.48 per cent for the year ample to care for all interest and dividends in outstanding securities. The total assets of the company increased from $61,126,208 to $67,838,787. Cash on hand when the report was closed was $1,335,700, with $1,576,963 on hand for materials and supplies. The sum of $1,420,592 was spent during the year for renewals and replacement reserves.

Court Refuses to Dismiss $30,000,000 Subway Suit

Judge Knox in United States Court has denied the city's motion to dismiss the suit brought by Lindley M. Garrison as receiver for the New York Municipal Railway Corporation to recover approximately $30,000,000 from the city because of delays in the fulfilment of contracts to build subways. The motion attacked the jurisdiction of the federal court and the legality of naming the city as a defendant.

Judge Knox held that the federal court had full power "to award relief in equity upon a strictly legal demand." He wrote that the suit would "involve an inquiry which for detail, itemization and proof will probably surpass any accounting with which the court is acquainted, and it would be most unfortunate if jurors were called upon to undergo the hardships of such an ordeal."

The city's motion was made after the New York Rapid Transit Corporation, as owner of the assets of the New York Municipal Railway Corporation, had been granted leave to intervene as a party plaintiff in the suit instituted by the receiver.

Another Block of Chicago Property's Stock Offered

Sale of 10,000 shares of prior lien, 7 per cent stock of the Chicago, North Shore & Milwaukee Railroad, Highwood, Ill., under the customer-ownership plan was announced recently by officials of the company. The stock will be sold for $100 a share, par value. This is the second block of prior lien authorized for sale by the Illinois Commerce Commission, the first block of $1,500,000 having been sold about a year ago. The second block, as in the case of the former sale, will be disposed of by employee-salesmen, every employee of the railroad who signifies his interest being made an authorized salesman of the stock.

The sale was opened at two special meetings of employees called for the purpose, which were addressed by Britton I. Budd, president, and other officials. The first block met with a ready market among patrons of the North Shore Line and it is believed that the additional $1,000,000 will go even better because of the establishment in the minds of the people of its value.

California Commission Reviews Valuation Cases

Important work has been done by the California Railroad Commission during the last fiscal year in the matter of valuations of properties of public utilities either in rate-making proceedings or in proceedings involving condemnation of those properties by municipalities; also in the valuation of railroad properties in co-operation with the Interstate Commerce Commission. An important part of the valuation work carried on during the year has been the appraisal of lands owned by public utilities within the State of California, which has involved the determination of the value of lands amounting to approximately $20,000,000 in connection with the various proceedings.

In addition to the valuations carried on in connection with the regulatory work of the commission, a limited amount of work has been done in connection with the valuation of the Los Angeles Gas & Electric Corporation's electric properties involved in the condemnation proceeding filed by the city of Los Angeles. A relatively large staff of engineers has been employed during the entire year in connection with the determination of the value of the city properties of the Los Angeles Railway and the Pacific Electric Railway. This involves property exceeding $50,000,000. Toward the close of the fiscal year work was commenced in connection with the valuation of all the electric properties of the Pacific Gas & Electric Company and Great Western Power Company in the city of San Francisco.

New Corporation to Develop Cities Service's Utilities

Formation of a new $100,000,000 corporation by the Cities Service Company, New York, to provide a vehicle for the development and expansion of its public utility enterprises is under way, to be known as the Cities Service Power & Light Company. Its authorized capitalization will consist of $20,000,000 of bonds, $10,000,000 of preferred stock, $5,000,000 of second preferred stock and $65,000,000 of common stock.

The Cities Service Company will own all the common stock of the Cities Service Power & Light Company, into which will be placed the common stocks of public utility companies operating in 15 states and serving a population of more than 2,000,000 scattered over 400 communities. Among the important properties to be included will be the Toledo Traction, Light & Power Company, which owns the Toledo Edison Company; the Ohio Public Service Company; Public Service Company of Colorado, including ownership of the Denver Gas & Electric Company; Kansas City Gas Company; the Empire District Electric Company and the St. Joseph Railway, Light, Heat & Power Company.

Gross business of the properties comprising the new corporation, it is understood, will total more than $49,000,000.

Formation of the new company will have no effect on the financial structure of the parent company except to provide a more flexible medium for development of the public utility phase of its business. This step is understood to have been long contemplated to establish a clear-cut division between the oil and utility enterprises of Cities Service and to make more effective the activities of the parent company in both fields.

Officers of the new company will include the principal executives of the Cities Service organization.

Right to Discontinue Lines Sought in Mobile

Discontinuance of certain railway service at Mobile is sought by the Mobile Light & Railway Company in a petition filed with the Alabama Public Service Commission. The petition was accompanied by a financial statement for the year ended Sept. 30, 1924, to the effect that the company's net income from railway operations for the year amounted to less than 1 per cent of its valuation. The company asked permission to take up tracks on Wilkinson Street from Charleston Street to Washington Avenue and on Washington Avenue from Wilkinson Street to South Carolina Street and to abandon service on Wilkinson Street and Washington Avenue and further asks to be permitted at any time during the next two years to take up the track on Old Government Street from its intersection with Government Street to Williams Street.

Traffic Declines on Detroit Street Railways

The city of Detroit, Department of Street Railways, has given out operating statistics for the months of July, August and September. Income and traffic figures are included in the accompanying table.

CITY OF DETROIT, DEPARTMENT OF STREET RAILWAYS

	July, 1924	July, 1923	August, 1924	August, 1923	Sept., 1924	Sept., 1923
Total revenue from transportation	$1,598,875	$1,660,055	$1,592,551	$1,671,959	$1,587,292	$1,766,670
Total operating revenue	1,669,815	1,764,174	1,639,962	1,754,349	1,654,788	1,843,027
Total operating expenses	1,175,483	1,299,326	1,168,345	1,314,975	1,170,524	1,360,890
Net revenue railway operations	$494,332	$464,848	$471,617	$439,375	$484,264	$482,137
Taxes and rent deductions	59,798	59,158	59,798	59,188	59,706	59,158
Net operating income	$434,533	$405,689	$411,819	$380,186	$424,558	$422,979
Total non-operating income	27,898	1,274	46,600	4,682	14,155	1,059
Gross income	$462,431	$406,963	$458,418	$384,868	$438,713	$424,037
Total deductions from gross income	432,312	376,012	428,102	376,929 q	412,192	364,824
Net income	$30,119	$30,951	$30,316	$7,939	$26,521	$59,213
Total car-miles operated	3,828,996	4,327,150	3,774,519	4,346,975	3,683,651	4,157,839
Total passengers carried	35,159,475	40,934,203	34,962,639	41,308,449	34,825,027	38,385,837

$7,000,000 Refunding Issue Approved at Worcester

Stockholders of the Worcester Consolidated Street Railway at the annual meeting in Worcester, Mass., on Nov. 5, voted to ask the State Department of Public Utilities for authority to create $7,000,000 in first and refunding mortgage bonds. The board of directors will have power to issue and sell bonds at such times and in such amounts as may be necessary to meet the maturing bond issues of the company. The bonds will be sold in series with different maturity dates and different coupon rates, depending entirely on the bond market at the time the money is needed. None of the bonds will bear interest at more than 6 per cent.

Clark V. Wood, president of the company, said the amount the directors suggested to the stockholders as a limit for the new bond issue was considerably more than the amount needed to meet the two maturities falling due in 1925. The mortgage will be so drawn that it will cover the entire property and equipment of the railway subject to the present underlying liens. Eventually, with the maturing of these liens, the new issue would become a first mortgage.

Two issues mature next year which must be met by the company. They are the Worcester & Southbridge Street Railway first gold 4½s, dated June 1, 1905, and due June 1, 1925, and the Worcester Consolidated Street Railway debenture gold 7s, dated March 1, 1900, and due March 1, 1920, but extended to March 1, 1925. The first of these issues is outstanding at present to the extent of $200,000 and the second to the extent of $700,000.

These two issues are the first of a series that will fall due within the next three years involving $3,083,000. Of the company's funded debt only three additional issues will be outstanding after 1927. One of these, totaling $1,449,000, will mature in 1930 and two others, totaling $124,000, will mature in 1939.

President Wood said the earnings of the company had been increasing slowly in the last quarter. The decrease in the gross earnings and the falling off in the number of passengers carried earlier in the year he assigned to unfavorable industrial conditions.

Form of Electric Railway Supplement to "Chronicle" Changed

"The Public Utility Compendium" is the title which the *Commercial & Financial Chronicle*, New York, has applied to the publication issued by it on Nov. 1 to replace that paper's former "Electric Railway Section." The compendium will be issued twice a year without extra charge to every annual subscriber of the *Chronicle*.

As the change in name implies, the new publication is much more comprehensive than the old, both in character and scope. It covers public utilities of every kind and description. Light and power companies are now represented, as well as the electric railways, and in addition there are water and gas companies and telegraph, telephone, cable and radio corporations. It is explained in part, as follows:

> In one particular the change has been forced upon us. The operation of the electric railways, urban and interurban, is now quite generally combined with the light and power business, and it is no longer possible to differentiate between the two. The development has grown out of the wonderful extension in the use of electricity which is the distinctive feature of recent times. * * * The next step was to unite the local units so that they might serve larger areas, and out of these undertakings have grown in turn the big combinations which, by reason of their splendid achievements in electrical development and in serving the advanced needs of man, are exciting the wonder and the admiration of the world.

Brooklyn City Declares an Extra of 5 Cents a Share

Directors of the Brooklyn City Railroad on Nov. 6 declared a regular quarterly dividend of 20 cents a share and an extra dividend of 5 cents a share on the 1,600,000 shares of stock now outstanding, or $400,000. The stock is of $10 par value.

The company has paid three quarterly dividends of $300,000 each on the 1,200,000 shares of capital stock outstanding prior to Sept. 30. For the full calendar year the company will have paid to stockholders $1,300,000 in dividends, and the company's surplus, according to President H. Hobart Porter, will have been increased by about $450,000. These results are based on estimated net earnings for the year of $1,750,000, which is applicable to dividends and surplus. For the first three-quarters of the year the net was $1,394,087.

Guaranteed Bonds of Lake Charles Property Offered

Stone & Webster, Inc., recently offered at 95 and interest $750,000 of first mortgage 5½ per cent gold bonds, known as Series A, of the Lake Charles Electric Company, Inc., Lake Charles, La., with guaranteed principal and interest by the Eastern Texas Electric Company of Delaware. The bonds were dated Aug. 1, 1924, and are due Aug. 1, 1949.

The Eastern Texas Electric Company recently purchased the street railway, electric light, gas and water systems and plants in Lake Charles, La. The purpose of the issue is to provide a portion of the funds required for the purchase of the above properties. The balance has been raised by the sale of capital stock of the Lake Charles Electric Company, Inc., the entire issue having been purchased by the Eastern Texas Electric Company of Delaware, which also controls, through stock ownership, the Eastern Texas Electric Company of Texas and the Port Arthur Ice & Refrigerating Company. The Eastern Texas Electric Company (Delaware) was recently organized to acquire and hold the stock of the Lake Charles and other companies.

The Eastern Texas Electric Company of Delaware guarantees the payment of principal and interest on this issue of series A bonds.

The Lake Charles Electric Company, Inc., has obtained new franchises during the current year, which run for a 25-year period and are free from restrictive and burdensome clauses. The properties are under the executive management of Stone & Webster, Inc.

$400,000 in Shares Sold.—The Wisconsin Traction Light, Heat & Power Company, Appleton, Wis., has disposed of $400,000 of its $500,000 issue of 7 per cent preferred shares. The sale was started on July 16 and the shares have been purchased by 700 new owners, most of whom are residents of the fifty-one places in which the company supplies a utility service.

Wants to Remove Certain Tracks.—The Union Traction Company, Santa Cruz, Cal., has applied to the Railroad Commission for permission to abandon service to Cliff Drive and to remove its tracks on Mission Street from Locust Street to Pacific Avenue.

Carhouses Sold.—The United Electric Railways, Providence, R. I., has sold two trolley carhouses used for storage purposes and two more are for sale at the present time.

Authorizes Track Removal.—Permission has been granted to the Trenton & Princeton Traction Company, Trenton, N. J., to remove as much of its track as lay between the terminus of the line in Lambertville, N. J., and the center of the bridge spanning the Delaware River between Lambertville and New Hope. Abandonment of the company's line in Pennsylvania has already been sanctioned by the Public Service Commission of that state.

Net Income Falls Off.—For the nine months period of the present year the Twin City Rapid Transit Company, Minneapolis, Minn., reports gross revenues of $9,527,686. This compares with $10,210,796 last year. The operating expenses decreased from $7,267,192 for the nine months period of 1923 to $6,968,918 for a similar period of the present year. The net income fell off about 36 per cent. It was $1,151,756 for the months of January to September, 1923, inclusive and $739,526 for the similar months of the current year.

Earnings Decrease.—For the third quarter of 1924 the St. Joseph Railway, Light, Heat & Power Company, St. Joseph, Mo., reports earnings for the railway department of $209,042. Compared with a similar period in 1923 the railway receipts showed a decrease of $37,794. The decrease in the earnings of the railway department has been gradual since the beginning of 1922, only two quarterly periods during that time showing a slight increase compared with the previous quarter. The banner quarter for the railway department was the last quarter of 1920, when receipts were $318,571. They are now averaging about $100,000 less than that amount.

Manitoba Property to Suspend Service.—The Brandon Municipal Railway, Brandon, Man., it is reported, is to cease operating and is to be replaced by buses. The Brandon Electric Railway was incorporated by the Manitoba Legislature in 1911. According to the *Canadian Railway and Marine World*, plans at that time were made for building 10 miles of line and arrangements were discussed for the city to issue debentures to aid in the construction. Finally it was agreed to take a vote of the citizens on the question of private or public ownership and the result was a vote of 458 to 176 for private ownership. A 30-year franchise was arranged and approved by the voters on May 21, 1912, but following some difficulties the city took over the project and authorized the raising of $300,000 by debentures for construction purposes. Operation for first year ended June 30, 1914, showed a loss of $14,542 and each succeeding year has continued to show a loss, with a reported loss in 1923 of $41,000. The line consists of 9.91 miles of track. It is said that tenders have been invited for the operation of buses.

Abandonment of Lines Authorized.—The Oklahoma Corporation Commission has authorized the Oklahoma Union Railway to abondon its Forrest Park line and the Fife Place line. The company is also given permission to take up its tracks, poles and wire on the streets included in these lines. The company first secured permission of the city through a city ordinance to abandon the lines and then took the matter up with the commission, as was noted in the ELECTRIC RAILWAY JOURNAL of Oct. 25.

Buys Bus Line.—The bus line between Hammond and Crown Point, Ind., has been purchased by the Gary Street Railway and is being run by that company. Three buses are now in operation between the towns and passengers are carried to Griffith, Highlands and Munster. Service to Calumet City is included in the schedule for the Gary Street Railway bus line.

Nearly $4,000,000 in Taxes.—Electric railways in Wisconsin, numbering twenty-one operating light, power and heat properties in connection therewith, will pay $3,560,968 in taxes for 1924, based on a valuation of $125,375,000. In 1923 these companies paid taxes of $2,171,140 on a valuation of $104,410,000. The Milwaukee Electric Railway & Light Company again heads the list with a valuation on its properties of $71,500,000 and a tax debt of $1,476,985.51.

Revenue Falls Off.—For the three months ended Sept. 30, 1924, the passenger revenue of the Brooklyn City Railroad, Brooklyn, N. Y., was $2,786,005, against $2,877,627 for the corresponding three months a year ago. The net corporate income fell off from $486,438 for the period ended Sept. 30, 1923, to $331,192 for the period from July to September, 1924.

Branch Line to Be Sold.—The receiver of the Indiana, Columbus & Eastern Traction Company, Springfield, Ohio, recently asked authority of the State Public Utilities Commission for permission to abandon and sell the branch road running from Dayton to Union City. This action was in accordance with an order of Federal Judge Killits of Toledo ordering sale of this line. The Union City branch has been losing money for some years, according to a statement made by J. M. Pogue, general manager of the company. A request has been filed by the Dayton-Columbus Transportation Company, a subsidiary of the traction company, for a certificate to operate a bus line between Dayton and Union City by way of Greenville, between

Dayton and Brookville and between Urbana and West Jefferson. It is said that the light-weight traction cars now being operated over the present route will be sent to Springfield, where they will be placed in service on the Springfield-Lima route.

Receiver Named for Long Island Electric.—A petition has been presented to Justice Leander B. Faber in Queens Supreme Court on behalf of the Chase National Bank, asking for appointment of a receiver in a foreclosure action which has recently been started against the Long Island Electric Railway, Long Island City. It is revealed that it is planned to try to unite the surface lines in Queens and Nassau and into one system as feeders for the elevated lines and subways that are being extended into Queens. Lincoln C. Andrews, who was formerly the general manager of the Long Island Electric Railway, has been appointed receiver.

Book Reviews

Electric Railway Handbook

A reference book of practical data, formulas and tables for the use of operators, engineers and students. By Albert S. Richey, consulting engineer and professor of electric railway engineering Worcester Polytechnic Institute. Second edition, 798 pages, illustrated. McGraw-Hill Book Company, New York. $4.

Since the publication of the first edition of this book in 1915 there have been many changes in electric railway practices. Unlike "Electric Railway Transportation," the second edition of which is reviewed on this page, Richey's "Handbook" treats of the material side of the railway property. While the fundamental principles of electric railways have not changed, as is indicated by the retention in the second edition of most of the matter dealing with theory that appeared in the former edition, there are striking changes shown in applications. Particularly is this true with regard to the light-weight types of car. The chapter on rolling stock has been completely rewritten.

A much greater use of track construction and maintenance machinery made necessary the complete revision of that subject. Other sections have been revised more or less extensively to conform with the latest practices. In this connection particular reference is made to the standards and practices of the American Electric Railway Engineering Association, many of which are quoted in full or in part. Numerous references to articles appearing in ELECTRIC RAILWAY JOURNAL also are included.

Comparatively few cost data appear in the new edition, but where such figures are given they are accompanied either by basic unit costs or the dates which apply, so that they can be converted to the present level.

There is much of value to the electric railway engineer in the volume, and with the many changes that appear in the new volume it is well worth while substituting it for the earlier edition.

Transactions Index, Volume 1-45, 1880-1923

Published by the American Society of Mechanical Engineers, New York, 1924. $3.

The present index to the Transactions of the American Society of Mechanical Engineers is the fifth which has been published, although none has been issued since the appearance of Vol. 27, which contained the index to Vols. 1 to 25, inclusive. For that reason, and because comparatively few complete editions of the Transactions are available, the present index applies more particularly to Vols. 26 to 45, inclusive.

The general style of the Engineering Index, published by the society, has been followed, grouping alphabetically all items under authors' names and subjects. This index should greatly increase the value of the Transactions for reference.

Electric Railway Transportation

By Henry W. Blake, editor ELECTRIC RAILWAY JOURNAL, and Walter Jackson, fare and motor bus consultant. Second edition, revised. McGraw-Hill Book Company, Inc., New York. 449 pages, illustrated. Cloth, $5.

This is a thorough revision of the book published in 1917 by the authors. While the same general form of presentation and chapter headings has been adhered to, there are many changes throughout the book.

When the first edition appeared the effects of the World War were just beginning to be felt. Five-cent fares were in force on nearly all city railways in America, the one-man car was just being introduced, "jitney" operation was still in its infancy, and only very few electric railways had even considered the operation of buses. The idea of merchandising transportation had made little headway, largely because most managements were content to take what revenue came naturally without special efforts toward ride salesmanship.

Many new types of cars are discussed in the chapter on "Car types in relation to traffic," showing the great progress that has been made in the design of street and interurban cars, particularly the development of light-weight and one-man designs. The chapters on adjustment of service to traffic and preparation of timetables have both been revised in the light of new developments looking toward greater utilization of men and equipment.

The complete revolution which has taken place in fares and fare collection methods and practices is shown by the entire revision of the chapters on these subjects. Practically every type of fare and fare collecting method in use in this country, and many developed abroad, are discussed.

A new chapter on motor bus operation by electric railways traces the development of this phase of the industry from its inception, considering the field of this vehicle and types of equipment desirable. Trackless trolleys and gas or battery rail cars are also treated briefly in this chapter.

To make room for the added material the chapters on "competition" and "freight and express" have been omitted from the second edition. The authors state that the former is covered in the chapter on motor-bus operation, while there have not been many changes in freight and express practices since 1917.

Elektrische Zugförderung

Train or Car Operation. By Dr. E. E. Seefehlner, Vienna. With a chapter on Rack and Cable Railways, by H. H. Peter, Zurich, 659 pages; 751 illustrations. Second and enlarged edition. Published by Julius Springer, Berlin.

This is the most extensive and scholarly volume on electric railway engineering published in Germany since Zehme's important treatise. As in the first edition, which was published in 1922, Dr. Seefehlner has limited the scope of his book very largely to the purely electrical engineering side of electric railroading; that is to say, he does not include track except so far as the return circuit is concerned, considers power stations only briefly, and does not discuss transportation questions. Heavy electric traction is treated more comprehensively than tramways, and there is an especially valuable section of 84 pages giving data, drawings and photo-engravings of the principal electric locomotives in different parts of the world. The subject of train resistance is very thoroughly discussed and in this section, as elsewhere in the book, mathematics is used extensively where it helps to clarify the discussion. In the chapter by Mr. Peter, the cable railways considered are primarily those for mountain installations. A valuable feature of the book is the inclusion, with the discussion of each subject, of an extended bibliography on that particular topic. American practice is treated in the book, and the ELECTRIC RAILWAY JOURNAL is extensively quoted.

Principles of Business Writing

By T. H. Bailey Whipple, literary critic Westinghouse Electric & Manufacturing Company, published by the Westinghouse Technical Night School Press, East Pittsburgh, 192 pages.

Originally the chapters in this book were prepared by Mr. Whipple for "Sales Letter," a Westinghouse publication intended for private circulation, and its purpose was to help in the production of clear letters and reports by those to whom it was addressed. The demand from outside, however, became so great that it was decided to put the material in book form. There are five parts as follows: I. Introduction. II. Principles of Business Letter Writing. III. Words and Phrases Often Misused. IV. Report Writing. V. Letter Writing. There is also an appendix, including some suggestions to authors of technical papers. The book is well worth inclusion in the library of every one who has occasion to do much business or technical writing.

Personal Items

A. C. Jordan, general electrical superintendent of the Elmira Water, Light & Railroad Company, Elmira, N. Y., has been relieved of the supervision of the maintenance of railroad equipment department. F. G. Maloney, superintendent of the railroad department, now has charge of the maintenance of equipment department as well as of track and transportation departments. These changes were made effective Oct. 22.

Sterling T. Dow will resign as manager of the York Utilities Company, Sanford, Me., on Dec. 1. He has been connected with the railroad company for fifteen years, being assistant treasurer for ten years, before his promotion to general manager. He was at one time freight agent of the Maine Central Railroad at Bangor and resigned to become assistant treasurer of the York Utilities. The York Utilities Company, formerly the Atlantic Shore Line Railroad, operates cars from Sanford to Biddeford, through Kennebunk and from Town House to Cape Porpoise and Kennebunkport.

A. L. C. Fell, general manager of the London County Council Tramways, is retiring, owing to ill health. He has occupied the post for 21 years. Much regret is felt in British tramway circles, as Mr. Fell is one of the best known and most highly esteemed men in the fraternity. Prior to coming to London he was manager of the Sheffield Corporation Tramways. He is a prominent member of the Municipal Tramways Association. He is an engineer by training and has been able to supervise alike the technical and administrative sides of the business. Mr. Fell is 55 years of age. He will receive a retiring allowance of about £1,000 a year. Mr. Fell was one of the men who took great pains to assist the A.E.R.A. committee on foreign operation in making its observations this past summer.

W. H. Sawyer was the principal speaker at a meeting of the Women's Republican Club of East St. Louis shortly before election day. It is not often that a public utility man will make the personal sacrifice to get out and do his bit for the cause of good government. Mr. Sawyer spoke at some length in behalf of Mr. Coolidge and Mr. Dawes, both of whom he has known personally for some 40 years.

W. W. Tarleton became assistant purchasing agent of the Georgia Railway & Power Company on Oct. 1. He was formerly purchasing agent of the Dixie Construction Company, a branch of the Alabama Power Company.

Fred W. Spring, superintendent of the Westbrook division of the Cumberland County Power & Light Company, Portland, Me., for the last 32 years, recently retired. His first position was that of a railroad conductor when the company was building the Westbrook road in 1891. For six months Mr. Spring was in charge of the construction work. When the road was opened on June 28, 1892, Mr. Spring was appointed superintendent. He has held that position continuously since then. Mr. Spring's son, Frank B. Spring, who has been his assistant for a number of years, has been promoted to succeed his father. Harry K. Higgins will become the assistant superintendent.

D. S. McManus Superintendent at Lake Charles

The new superintendent of the Lake Charles Electric Company, Inc., Lake Charles, La., is D. S. McManus, who was transferred recently from the Houston Electric Company, Houston, Tex.

Mr. McManus has been in the railway field a comparatively short time, but in a period of four years he has proved himself invaluable to his management. He entered the employ of the Houston Electric Company, a Stone & Webster property, on Sept. 1, 1920, after being graduated from college as electrical engineer. He served in the various departments until July 1, 1921, at which time he was made assistant to the manager of the Houston Electric Company and the Galveston-Houston Electric Railway. In that capacity he remained for more than a year and was then transferred to Lake Charles, where he is now in charge of the street railway, construction and distribution systems of the light and power, water and gas departments, as well as the delivery departments of the ice plant.

D. S. McManus

The property with which Mr. McManus is now associated is under the executive management of Stone & Webster and is controlled by the Eastern Texas Electric Company of Delaware. The Lake Charles Electric purchased the old Lake Charles Railway, Light & Water Works Company on Aug. 1 of this year.

Unosuke Kurihara, chief secretary of the car operation department of the Municipal Electric Bureau, Tokio, is on a visit to this country to study electric railway operation, particularly rapid transit conditions. Later he expects to visit Europe.

Ivor Fraser, publicity manager of the London Underground electric railway companies, has resigned that office to become manager of the *Morning Post*, London. A. L. Barber, commercial manager of the companies, will for the time carry on the duties of publicity manager in addition to his regular work. It was under Mr. Fraser's direction that much of the excellent work in bettering public relations in London has been done for the so-called Underground group. This work included the advertising of the lines, one of the most important features of which was the use of art posters, which have attracted attention in all parts of the world. American electric railway men will remember Mr. Fraser as one of the party of London Underground railway officials that visited this country in May, 1923.

Obituary

Maurice Tremper, roadmaster of the Seattle Municipal Railway, Seattle, Wash., a system which comprises 235 miles of line, for ten years, died in that city recently, at the age of 57 years. Mr. Tremper before going to Seattle was roadmaster of the Detroit United Railway for 12 years.

Charles A. Piper, for ten years superintendent of the Key System Transit Company, Oakland, Cal., died suddenly in that city, Oct. 26. Mr. Piper was identified with the Key System ever since its establishment in Oakland. During the first ten years of the company's existence he served as general superintendent. He was 57 years old.

F. J. Frey, division superintendent of the Fresh Pond division of the Brooklyn-Manhattan Transit Corporation, Brooklyn, N. Y., died recently, after an illness of several months. Mr. Frey started in as a motorman with the Brooklyn Company twenty-nine years ago. He was appointed division superintendent. Mr. Piper was 57 years old.

William Gray Evans, a pioneer of Colorado and the man who took a conspicuous part in the organization of the Denver Electric & Cable Company, now the Denver Tramway Company, died Oct. 21, after an illness of three weeks. For many years he was president of the latter company, but resigned that office in 1913. Mr. Evans was the son of John Evans, who founded Northwestern University at Evanston, which is named after him. John Evans was appointed Governor of Colorado by President Lincoln. William Evans inherited many of the sturdy characteristics of his illustrious father, so much so that the son was characterized at one time as the most dominating personality in Denver life. He was interested in several banking institutions and at one time was head of the local Republican organization in Denver. It was Mr. Evans who had the idea of the Moffat tunnel through the Continental Divide. When the story of the Denver & Salt Lake Railway (Moffat Route) is told, his name will be linked with that of David H. Moffat.

for Discussion of Manufacturing and Sales Matters

$7,000,000 Spent at Los Angeles for Equipment

During the present year the Pacific Electric Railway management has contracted for varied freight and passenger equipment the cost of which entails an outlay of $4,377,000, all of which will be delivered and available for service during the current year. For its local lines 50 new 600 class cars, of the new type used in the Hollywood service, are now being built by the Brill Company of Philadelphia. Delivery at the rate of six cars weekly is scheduled to begin within 60 days, and following their arrival will be sent to the Torrance shops of the company, where electrical equipment will be installed. These cars, seating 65 passengers, have proved highly satisfactory both to the public and management and were so designed as to be capable of being operated in three-car units, which will be done upon the completion of the Hollywood-Glendale-San Fernando Valley tunnel now in course of construction.

To augment its freight equipment, 1,350 assorted freight cars were ordered several months ago, approximately 33 per cent of which have been received in recent months and complete delivery of which will be fulfilled within the next few months. With these cars available the Pacific Electric, which is the third largest carrier in point of freight volume handled in California, will be in a position to meet any demand made upon it by Southern California shippers. This lot of 1,350 freight cars cost approximately $3,000,000 and is the largest freight equipment order ever placed by the Pacific Electric.

Additional power will be supplied through five 60-ton freight locomotives, material and equipment for which is now being assembled for construction at the Torrance shops of the company. The railway's shops were the lowest bidders on the construction of this equipment and the work was awarded to its own mechanical department. These locomotives are the largest and most powerful type ever built on the Pacific Coast and cost approximately $45,000 each.

Both single and double deck motor coaches have been delivered or ordered during the present year to the extent of $150,000. Several double-deck buses will be delivered soon and will go into service on the lines of the Los Angeles Motorbus Company, jointly owned and operated by the Los Angeles and Pacific Electric Railways.

The foregoing equipment represents rolling stock ordered during the present year, but does not include 50 600-class cars and 50 1,100-class interurban cars ordered during 1923 on which delivery has been made recently. This lot of equipment represents an outlay of $2,850,000, which, together with that ordered during the present year, makes an aggregate outlay of $7,227,000 for equipment, all of which will be delivered during the present year.

Railway Modernization in Java

The Java State Railways is buying modern cars and trailers for suburban passenger service in the section that includes the cities of Batavia and Meester Cornelis. The General Electric Company is electrically equipping 10 of the cars and the Westinghouse Electric & Manufacturing Company 5. The other 15 of the 30 cars on order are trailers. The Electric Storage Battery Company is furnishing Exide batteries and the J. G. Brill Company the car seats. The pneumatic door-opening mechanism is manufactured by the Consolidated Car Heating Company and the rubberoid by the Standard Paint Company. The all-steel bodies are being built in Holland.

The trolley voltage is 1,500 d.c., and each motor car will carry a motor-generator set to supply 65-volt current for operating the control mechanism and air compressors, supplying the lights and charging the storage batteries. The so-called subway type of ceiling fan will be used in motor cars and trailers.

Free Nation-Wide Employment Service Urged

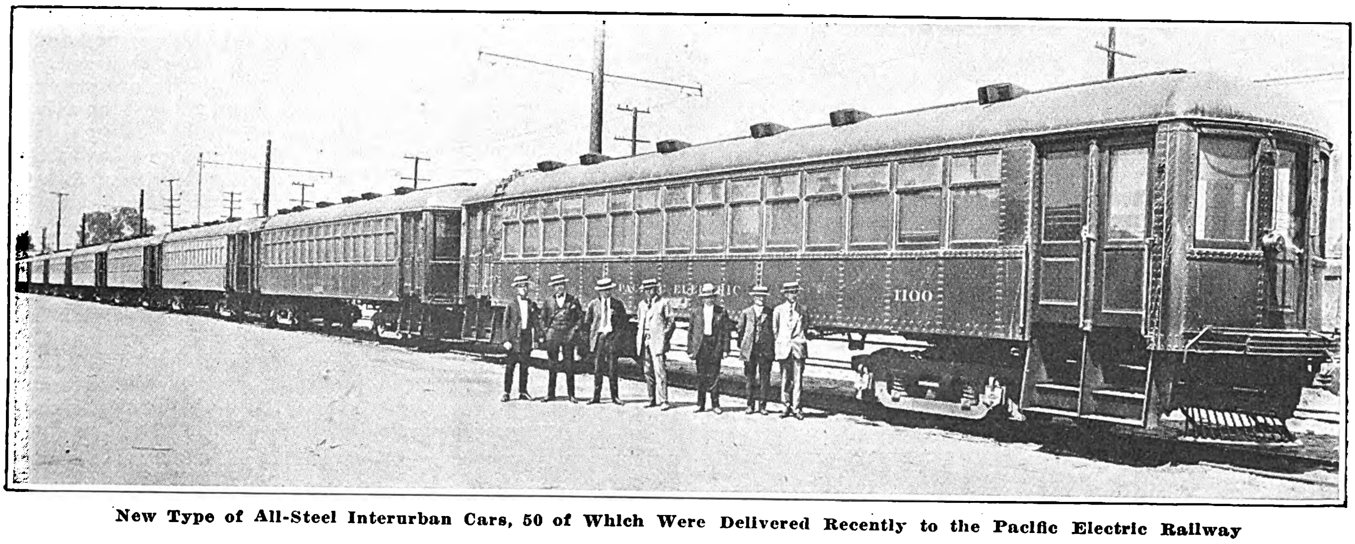
The establishment of a free nation-wide public employment service, to be maintained by the states in co-operation with the federal and local governments, for the benefit of men, women and juniors in all walks of life, is recommended by the Russell Sage Foundation in a 600-page report on employment methods, needs and agencies which was made public on Oct. 20 as the result of a five-year study which took the foundation's investigators into more than 70 cities of the United States and Canada.

The full report is being submitted to President Coolidge and to the governors of the states. The outstanding facts in the foundation's findings and its recommendations will be brought to the attention also of municipal and county officials, employers' associations, labor organizations, civic and social agencies and the executives of other organizations concerned with the general problems of employment or unemployment. The importance of the foundation's studies in this field becomes apparent when it is recalled that a preliminary statement made public several weeks ago showed that unemployment is no longer an occasional problem, but a constant phenomenon affecting large numbers of workers in every community.

Shelby M. Harrison, director of the department of surveys and exhibits of the Russell Sage Foundation, was in charge of the studies on which the report is based.

In conclusion the report says:

> Whichever proves finally the more desirable, an exclusively federal or a federal-state-local employment service, it is commonly conceded that the former is not at present feasible, and with this we are in agreement. To think that Congress, either now or in the immediate future, would appropriate $10,000,000 for an employment service, an amount estimated as necessary to provide an adequate basis is an idle dream. Expediency demands combined federal-state-local administration. We must begin with what we have.



New Type of All-Steel Interurban Cars, 50 of Which Were Delivered Recently to the Pacific Electric Railway

Metal, Coal and Material Prices

Metals—New York	Nov. 4, 1924
Copper, electrolytic, cents per lb.	13.375
Copper wire base, cents per lb.	15.125
Lead, cents per lb.	8.65
Zinc, cents per lb	6.575
Tin, Straits, cents per lb.	53.00
Bituminous Coal f.o.b. Mines	
Smokeless mine run, f.o.b. vessel, Hampton Roads, gross tons	$4.475
Somerset mine run, Boston, net tons	2.05
Pittsburgh mine run, Pittsburgh, net tons	1.875
Franklin, Ill., screenings, Chicago, net tons	1.375
Central, Ill., screenings, Chicago, net tons	1.125
Kansas screenings, Kansas City, net tons	2.00
Materials	
Rubber-covered wire, N. Y., No. 14, per 1,000 ft.	$6.25
Weatherproof wire base, N. Y., cents per lb.	17.75
Cement, Chicago net prices, without bags	2.20
Linseed oil (5-lb. lots), N. Y., per gal.	$1.115
White lead, in oil (100-lb. keg), N. Y., cents per lb., carload lots	0.152
Turpentine (bbl. lots), N. Y., per gal.	0.875

Rolling Stock

Long Island Railroad, New York, has placed an order for 40 electric cars, to cost approximately $1,200,000. This represented the 1925 allotment for new equipment. The Westinghouse Electric & Manufacturing Company has received the contract for the electrical equipment in the new cars, which will cost about $450,000.

Toledo & Indiana Railroad, Toledo, Ohio, has placed seven new cars built by the Cincinnati Car Company in service between Toledo and Bryan. The cars are 45 ft. long, weigh 30,000 lb., seat 50 passengers, and have a maximum speed of 55 m.p.h. The new equipment includes white dome lights, electric foot warmers, and standard green plush automobile type cushion seats.

International Railway, Buffalo, N. Y., through its subsidiary, the International Bus Corporation, has ordered 16 double-deck buses for the Delaware Avenue line and 12 single-deck buses for the Delaware Avenue line. The double-deck buses will cost $176,000 and the single-deck buses $106,000.

Wisconsin Public Service Corporation, Green Bay, Wis., plans to replace the present four 25-hp. motors and trucks on its four interurban cars on the Green Bay-Kaukauna line with new trucks and 35-hp. motors.

Philadelphia & Western Railway, Norristown, Pa., has put in service a new light-weight interurban car built by the J. G. Brill Company with Brill light-weight trucks. The car weighs 57,000 lb. It is 50 ft. long by 9 ft. 6 in. wide and seats 65 passengers. The equipment consists of four Westinghouse 535-Bl motors, each of 60 hp. capacity. The control equipment is Westinghouse panelboard type with modifications so that this equipment will operate in trains with two other types of equipment now used by the Philadelphia & Western road. Westinghouse air brakes are used.

Track and Line

Boston, Mass.—The Boston Transit Department announces that bids will be open on Nov. 25 for the first section of trackage and incline 1,300 ft. long to connect the Boston Railway tunnel line at Andrew Square with the New Haven track grade. This is in line with the Shawmut branch electrification.

Milwaukee Electric Railway & Light Company, Milwaukee, Wis., plans to build an electric freight line from its Lakeside power plant to connect with the Chicago & Northwestern Railway.

Philadelphia Rapid Transit Company, Philadelphia, Pa., has announced its readiness to build an extension of its tracks from Fifth Street and Olney Avenue to Fifth Street and Green Lawn, with a loop at the latter point.

Inter-City Terminal Railway, North Little Rock, Ark., has been given the right to extend its lines along East Second Street to the city limits and along East Seventh and East Eighth Streets to B Street, according to an ordinance passed recently by the City Council by a vote of 7 to 2. The ordinance requires the company to pave between the rails and for 18 in. on each side of the track.

United Railways, St. Louis, Mo., has just completed the double tracking of Franklin Avenue for a distance of more than a mile at a cost of $230,000. When Easton Avenue between Twenty-eighth and Thirtieth Streets is widened it will be made a double-track street.

Southern Public Utilities Company, Charlotte, N. C., has started work at Winston-Salem on the rehabilitation of the line to Southside. The work, including a large amount of paving, will cost approximately $6,000.

Trade Notes

Combustion Engineering Corporation, Detroit, Mich., announces that James Cleary, formerly manager of its Philadelphia office, will assume management of the Detroit and Cleveland territories, with headquarters in Detroit. Frank Henderson will continue in charge of the Cleveland office. Joseph Lappin, formerly in charge of the Detroit office, has been assigned to New York for special work. The Detroit office has moved from the Penobscot Building to the Book Building.

Cameron & Barkley Company, Charleston, S. C., have been appointed district representatives for the Central Iron & Steel Company's Charleston district.

Hubbard & Company, Pittsburgh, Pa., manufacturers of pole line hardware, will erect a plant at Emeryville, Cal., to supply better the Western trade. It is expected that this plant will be completed and in operation by the middle of October. R. M. Kerschner, formerly sales manager of the electrical department, has been made Pacific Coast manager and has taken up his new duties.

Frank A. Wilch, who has been associated with the Cleveland office of the Triumph Electric Company of Cincinnati, has been placed in charge of that territory. He succeeds Edward S. Ford.

Economy Electric Devices Company, Chicago, Ill., announces that it has been appointed Central Western sales representative for the Chausse Oil Burner Company's kerosene burning torches and burners. These burners are used in connection with Babbit melters, enameling ovens and baking ovens.

Electric Service Supplies Company, Philadelphia, Pa., is now occupying new and larger offices in the Hudson Terminal Building, 50 Church Street, New York. The room number is now 1581.

Thomas K. Scott has been appointed Mid-West sales manager of the Taylor-Wharton Iron & Steel Company, Easton, Pa. He will be located at Denver, Col., in charge of the sales district of which Denver is headquarters. Mr. Scott has had a wide and profitable experience in mining. He entered the Columbia School of Mines in 1904, but left before completing his course in order to take up work for the Cumberland Ely Copper Company, Nevada. In 1908 he re-entered Columbia and completed his course, receiving the degree of engineer of mines. He has lately been chief engineer of Miami Copper Company.

New Advertising Literature

Ohio Brass Company, Mansfield, Ohio, has issued a new pamphlet giving information on the installation of its arc weld bonds.

Ramsey Chain Company, Albany, N. Y., has issued an interesting treatise "Power Transmission with Ramsey Silent Chain."

Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., has recently issued Leaflet 20,190, including ten sheets, one each devoted to illustration and specific weights, dimensions and ratings on locomotives which have been built for the Pennsylvania Railroad, New York, New Haven & Hartford Railroad and Chicago, Milwaukee & St. Paul Railway.

Nichols-Lintern Company, Cleveland, Ohio, has issued a new catalogue, "File of Products by N-L." They give information and data on ventilators, indicating signals, stop-signals, lanterns and all other N-L products.

Shepard Electric Crane & Hoist Company, Montour Falls, N. Y., has issued a 60-page illustrated booklet entitled "Floor-Operated Electric Hoists." The pamphlet gives information regarding capacities, heights of lift and prices, as well as a description of each type of floor-operated hoist made by the Shepard Electric Crane & Hoist Company.

Griscom-Russell Company, New York, N. Y., has issued a new bulletin on Russell U-tube storage heaters. One of the features is the completeness, logical arrangement and legibility of the tables. These tabes cover a large number of steam pressures as well as initial and final water temperatures, and include complete details of tank sizes, capacities and dimensions for a wide range of storage capacities. Besides a complete description with details of construction and specifications of the Russell U-tube storage heater, the bulletin also contains a valuable table of data which has not hitherto been published on hot water requirements for various industrial and domestic uses.

Crouse-Hinds Company, Syracuse, N. Y., has issued Folder No. 17, on arktite circuit-breaking plugs and receptacles.

Machine Tools Will Be Developed Only if Electric Railways Buy

ONE of the most common deficiencies of electric railways is the glaring inadequacy of their shop equipment. Some 40 per cent of their machine tools are more than 20 years old. Many improvements in machine tools have been made, the benefits of which are not being shared to any extent in our field. These improvements should be given careful consideration as a part of their modernization program.

Some of the machines of late design which are particularly suitable for electric railway shop conditions include lathes, drill presses and planers, with provision for increased speed and capacity of the drive and feed mechanism to give greater production. Another marked improvement in machine tool equipment is in the new methods used for lubricating bearing parts. Many recent machines have forced-feed lubrication of all bearings and an oil bath for gearing. Rapid developments have been made in grinding machines, and many electric railways are obtaining definite economies from substitution of grinding operations for the machining methods previously used.

There has also been considerable activity in the design of smaller tools and general utility machines. These are very useful for small electric railway properties where the amount of work of one particular class is insufficient to warrant the investment in a special machine for a particular type of work.

Machine tool manufacturers have developed a number of new designs of machine tools particularly adapted to electric railway work. But these tools have not actually been constructed pending the receipt of orders. The manufacture and future development of machines especially designed for the electric railway thus depends to a large extent on whether electric railway men show signs of desiring such improvement by actual purchases.

An Amateur Watch Repairer Is a Poor Man to Imitate

THE story of the amateur watch repairer who after taking a clock apart and tinkering with it put it together again and had a number of wheels left over is familiar to all of us. It is a classic example of what happens when an unskilled workman undertakes a difficult job.

But what of the railway trackman who tears up the pavement to repair a joint and has a quantity of paving material left over after he has completed the work? Such things occur with greater frequency, perhaps, than some managements realize. The reason that there is a surplus of paving material, of course, is that the pavement has not been put back properly. It is a great deal more difficult to restore the surface as it should be than simply to fill up the hole with dirt and stones and to dispose of the excess material. Slipshod track maintenance methods of this kind, however, are as great a reproach to the railway which permits them as are the tinkering methods of the watchmaker who has extra parts left over.

Since the automobile has come into as widespread use as it has at the present time, the quality of the street paving is a matter of interest to a far larger number of people than it used to be. Coincident with this the electric railways have undertaken on a large scale to cultivate public good will in the communities they serve. But it is of little avail to talk of "friendlyizing" the public while continuing to do things that are a source of irritation to large numbers of people. It is certainly a mistake to economize on track maintenance to the extent that the pavement in the railway area contrasts unfavorably with the pavement elsewhere in the street. The money saved in making cheap pavement repairs is a poor economy if the finished surface is rough and unsightly, and a source of annoyance to the general public.

Using Railway Labor More Efficiently

THE problem of stabilizing the work done by the maintenance forces of an electric railway is rendered more important now that higher wages are being paid. Nearly all railway companies are using all the rolling stock they have available during the rush-hour period. Consequently it is necessary to make repairs during the off-peak interval. Usually, cars cannot be placed in the shops until 9 or 9:30 in the morning, and they must be released by 4 o'clock in the afternoon. The real problem of stabilizing labor is to provide something for the men to do before the cars are placed in the morning and after they are released at night.

There is much work which can be done during these times, but unless a careful program is laid out in advance, there is a tendency for the men to loaf or work inefficiently. One large railway with a number of inspection shops uses the men in the mornings, before the cars are placed, for making up and repairing stock of the particular class that the men are familiar with. Thus the controller inspectors make contact tips,

This is the issue in November that is devoted essentially to maintenance subjects

put new springs on controller fingers, remove carbonization from arc deflectors which are suitable for use to replace defective parts, etc. The motor inspectors look over carbon brushes that can be cut to smaller dimensions for reuse, and they repair brush-holder parts and the like. Oilers sort waste, look after its soaking with oil and get the day's supply ready. Other inspectors do similar work.

Still another part of the problem of stabilizing labor is to provide for uniform employment of forces at different periods of the year. The practice of releasing men at certain seasons and hiring new ones at the period of greatest need does not work out efficiently, since the railways lose the benefit of retaining men of experience. Among shop forces, a schedule of painting and general overhauling can be so laid out as to fill out the period when men will not be required on other work, and so they will work more efficiently and at the same time a uniform force will be kept through the year.

The track and way departments of steam roads have found that new rails can be laid almost as efficiently during the winter as during the summer season, and so many steam roads are placing their orders for rails during the latter part of the year with the idea of using their forces on this work during the winter season when they could not work on other track maintenance repairs. As an example of this, it is reported that three-quarters of a million tons of rail already have been ordered since Sept. 1. This tonnage is much larger than has been ordered in the same period for many years past. Interurban electric railways might follow this practice to advantage.

Hiring men when work is heavy and laying them off when it is light has been found to produce serious losses to the companies as well as being unsatisfactory to the employees. The methods suggested here would be a step in the direction of overcoming the loss which necessarily accompanies a frequent turnover of labor.

Better Maintenance at Lower Cost

THAT no maintenance situation is so bad that it is without hope was brought out forcefully in a paper by W. C. Bolt at the recent meeting of the New England Street Railway Club, which was abstracted in ELECTRIC RAILWAY JOURNAL for Nov. 8. Four years ago the situation on his road, the Eastern Massachusetts Street Railway, was deplorable. In July, 1920, a midsummer month, there were 1,489 equipment failures requiring removal of the car from service, or one pull-in for every 1,400 car-miles. The leading cause of trouble was hot bearings, with 339 failures, while air-brake troubles followed with 222 failures. Armature failures were altogether occurring at the rate of 500 per month.

Certainly such a record must have seemed almost hopeless. It represented a situation that had continued for years and had come to be considered in the same light as was the yellow fever by the inhabitants of the Canal Zone before American engineers got on the job—something that couldn't be cured and had to be endured.

While it must have been a huge task to overcome precedent and prejudice, the attempt was made, with the result that in September of this year there were only 104 maintenance pull-ins from all causes, or one for 14,500 car-miles—a record ten times as good as that in 1920. One large division even bettered this good record by running 75,000 car-miles per pull-in.

The skeptic can argue that any one can make such a record by spending enough in maintenance to keep the cars in first-class condition. The most surprising part of the story is that this good record has been obtained with a reduction in cost of maintenance per car-mile from 6.2 cents in 1920 to 3.54 cents this year —a total saving of more than half a million dollars.

Part of the saving has been due to the purchase of new cars with modern equipment, but a great deal has come from a better understanding of the work and the use of improved practices. Inspection is now made by meter inspection dials instead of in a haphazard manner, modern methods of armature and field coil repairs are used, and better oiling practices have been adopted. Welding is used for many important jobs. Painting is done frequently, but paint spraying has cut down the cost. The shop forces have been greatly reduced, the number of shop men dropping from 447 to 188 in the four years.

The record of this road is exceptional, but it is something that can be matched by any other road that is suffering from the same troubles. The use of modern practices, which is continuously being advocated by this paper, will give a like result wherever applied. It may even be bettered, for Mr. Bolt says that there is still room for improvement on his own property.

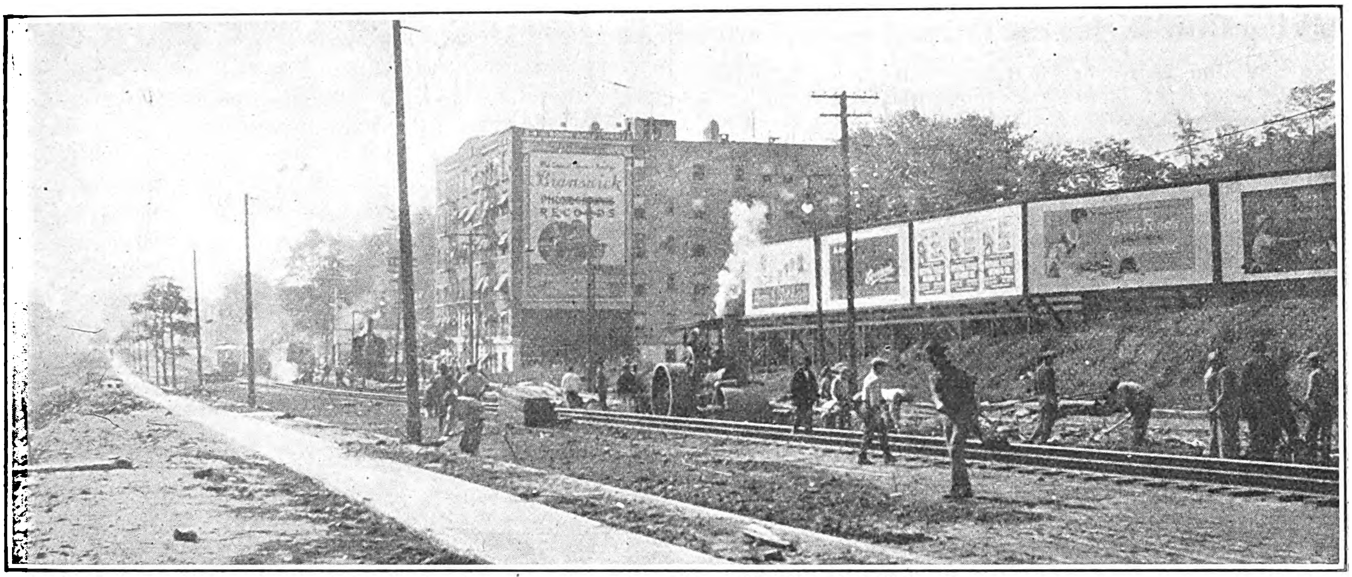
California and Washington Reject Government Ownership of Utilities

WHILE the defeat of Senator LaFollette in the national contest was decisive, it is reassuring to know that his schemes of public ownership were not the only ones rejected by the voters last week. Government ownership was an issue at several of the state elections, notably in California and Washington.

The referendum in California was on a measure to bond the state for $500,000,000 to permit it to acquire, construct and operate hydro-electric generating and transmission systems. But the electorate spoke in no uncertain voice, turning down the measure by a vote of considerably more than 2 to 1. This is the second time within the last two years that such a plan has been voted down by the people in California—a good indication of common sense in that commonwealth.

In Washington, which was another state to declare itself in favor of private initiative for utility operation, the measure under consideration was known as the Bone bill, and its purpose was to permit the cities and towns in the state to buy and sell electric current both within and without their corporate limits and to acquire and construct electric generating and distribution systems. Naturally, those who realize the danger of such a policy pointed out its defects, and the vote was decisive against it. Even in the city of its birth, Seattle, the measure was lost. The voters in that city have already had a taste of what municipal ownership of utilities means and wanted to preserve the state at large from a similar experience.

Altogether, considered not only from the national point of view but also from the local point of view, there is not much in the results of the last election that should give encouragement to the advocates of government ownership.



Careful Planning Made Possible the Completion of This Job in a Short Time. The Steam Shovel, Steam Roller, Track Layers, Joint Welders, Grinders, and the Paving Gang Followed One Another in Close Order

Rapid Track Reconstruction with Butt-Welded Joints

Third Avenue Railway Tries New Butt-Weld Method of Making Joints on Large Replacement Job on Upper Broadway—Designed by Manufacturer to Facilitate the Work—This and Careful Organization Made Speedy Progress Possible—Easily Moved Crossovers Aided in Avoiding Interruption to Service

ON A RECENT reconstruction job, the Third Avenue Railway, New York City, has been using the new electric butt-weld type of joint developed by the Lorain Steel Company. Prior to this installation by the Third Avenue Railway, butt-welded joints made under pressure were tried in Boston and in Philadelphia. About 500 joints were made in each place. In Philadelphia, the welding was done at the side of the street and long lengths of welded rail were then moved over into place in the track structure. In Boston, the procedure followed was substantially the same as that of the recent job in New York City, described here.

The reconstruction of 1½ miles of double track on Broadway from 242d Street to the Yonkers city line was undertaken when the city decided some time ago to repave the streets. The street here is part of the famous Albany Post Road and carries extremely heavy vehicular traffic. It was therefore desired that the period during which the street was torn up and closed to traffic be as short as possible. Railway traffic along this route also is heavy and the company wished to carry out the work with a minimum number of interruptions to service.

The old track structure consisted of 9-in. grooved girder rail L. S. Co. No. 323 on untreated wood ties with bolted joints. The new construction is with standard A.E.R.E.A. 7-in. 122-lb. grooved girder rail on new creosoted ties spaced 2 ft. on centers. It is estimated that the total cost of the work will be approximately $180,000.

On this section of upper Broadway the old track had been in service for many years and for some time the company had been considering its replacement. Actual work was not undertaken, however, until the city decided to repave the streets. The reconstruction was very carefully organized in order that it might proceed with the least possible delay. Work was carried on simultaneously from two points on the job, in the following manner:

The first step in the reconstruction was to cut the old rail by an oxyacetylene torch every 20 ft. throughout its length. This cut was made down to within a short distance of the base of the rail. After this had been done, cars continued to operate over the cut rail until the time came for it to be taken up.

Then a sliding crossover was placed at each end of the strip of track to be torn up. Special importance attaches to the use of sliding crossovers, because they permitted the operation of cars past the reconstruction work on a single track on comparatively short headway. The design of these crossovers is such that they can be moved easily from one location to another. This is done by fastening each side of the crossover to the rear of a work car. The cars are then moved simultaneously in the same direction, pulling the crossover behind them. Unless there is some obstruction in the center of the right-of-way between the tracks, the crossover can be moved without being taken apart. This process is much simpler than that of taking apart the usual bolted crossover, loading the pieces onto a car, conveying them to the new location, unloading them from the car, and putting them together again. The process of moving a sliding crossover is so simple

that the plan called for moving these every night and thereby made it possible to keep down to a minimum the length of single-track operation.

The old pavement and rail were taken up by steam shovels and loaded on to automobile trucks. Behind the steam shovels a gang of men with picks and hand shovels completed the job of preparing the subgrade, which was then thoroughly compressed by steam rollers. On account of the large number of small stones mixed with the soil in this locality, the ground after rolling has practically the qualities of a ballasted track foundation.

New creosoted ties were placed directly on the rolled earth. The new rail was then laid on the ties and loosely spiked. Because the rails are squeezed together during the welding operation, it was necessary to leave the rails loose enough so that they could be drawn into position for making the weld.

A powerful pressure clamp which is shown in an accompanying illustration was supported on rollers running on the heads of the rails. In making a weld the clamp was placed over the two rail ends and wedged firmly to them. The ends of the rails were kept separated about ⅜ in. and clay molds placed around them. These molds had previously been formed and then baked in an electric furnace located in one of the grinding cars. Into these molds was poured molten borax heated in another furnace in the welding car. Low-voltage electric current sent through the joint keeps the borax boiling and brings the rail ends to the temperature necessary for welding.

When this temperature is reached a pressure of 5,000 lb. per square inch is obtained by hand-operated hydraulic jacks, and the rails are pulled together with sufficient force to upset the ends and give a thorough weld. This process produces an excellent joint with only a small amount of superfluous metal to be removed from the head of the rail. The appearance of such a joint is shown in an accompanying illustration. Although there are bolt holes in the rail, these play no part in the process. The Third Avenue Railway customarily buys rail with such holes already made, and the usual rail was used on this job regardless of the fact that the bolt holes were not needed. All joints were post-heated before grinding. For this purpose an oil torch was used, operated by air pressure from the welding car.

The grinding of the joints was done in three steps. First, a large rotary grinder, that was virtually a planer, was used to make the head of the rail smooth. This was followed by another car specially designed by the Lorain Steel Company to remove the surplus upset metal from the groove of the rail. Finally, a workman with a small electric hand grinder went over the joint and put the finishing touches to it. One welding and two grinding cars were used and they followed one another in close order as the joints were made. Two sets of pressure clamps were used, one on each rail, the first being adjusted to position while the second was used in making a joint. Immediately behind the welding car came the first of the grinding cars to smooth the head of the rail. A short distance behind the second car came the third, equipped to grind the groove of the rail. To this third car was attached the hand electric grinder.

After the joints had been made, the space between the ties was filled in with the same mixture of dirt and rock that was used for the foundation. Tamping and back ramming of this material were all done mechanically by means of Ingersoll-Rand tie tampers.

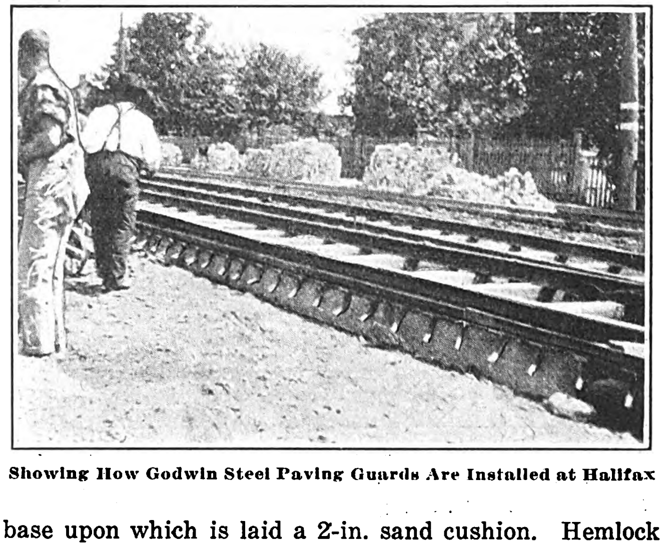
The railway company's contract with the Lorain Steel Company called for an average of 18 joints per day, but on several days 30 joints were made in less than 9 hours. With 60-ft. rail this means close to 1,000 ft., or four city blocks, of track per day.

Under the laws of New York State, the railway company has the option of itself paving the area for which it is responsible or of allowing the city to do this work. In this case the city is paving the entire street from curb to curb, and the railway company employed the city contractor to excavate and prepare the railway area ready for laying the ties. Some hesitancy was felt by the municipal authorities in allowing the railway and the contractor to close the street altogether to vehicular traffic. It was pointed out, however, that by having the use of the entire area during the period of reconstruction it would be possible to perform the work much more quickly than could otherwise be done, and thereby reduce the total amount of delay to vehicular traffic.

Paving Guards Used in Halifax

AN INTERESTING type of track structure has been used for the past two years by the Nova Scotia Tramways & Power Company, Ltd., Halifax. In streets where there are car tracks the city paving area extends to the end of the ties. At this point Godwin steel paving guards have been installed to separate the city paving from the railway paving, and to prevent the disintegration which in the past has occurred along this line.

The track structure itself consists of a 6-in. concrete base upon which is laid a 2-in. sand cushion. Hemlock ties 6 in. x 7 in. x 7 ft. are used. The rail is 60-lb. T Lorain section 263. Joints are of the continuous bolted type with six special hard carbon steel bolts per joint. Similarly a 6-in. concrete base is used for the paving with a 1-in. sand cushion. The surface is a 3-in. layer of asphalt.

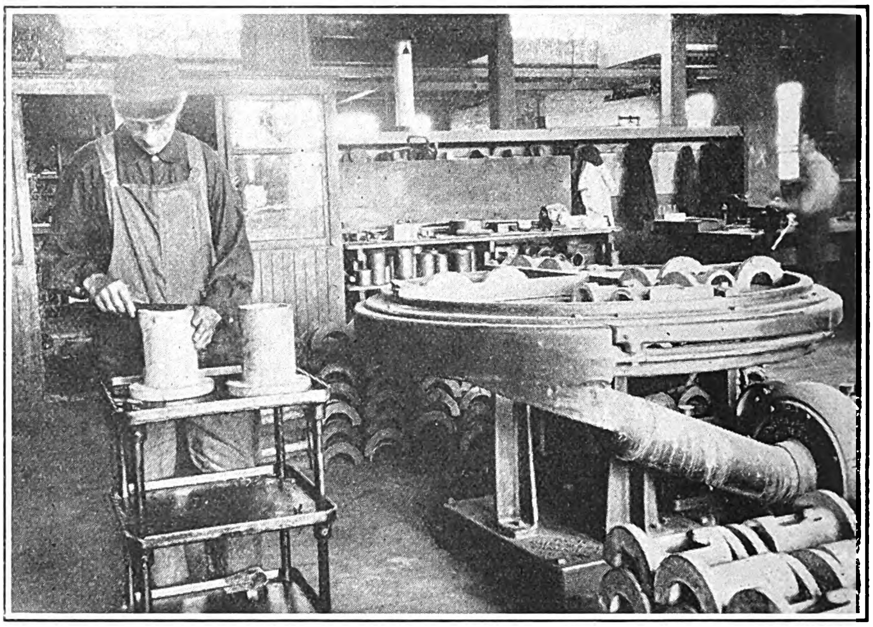


Showing How Godwin Steel Paving Guards Are Installed at Halifax

The use of paving guards in Halifax has proved satisfactory and economical. Neither the action of the severe winter weather nor the pounding of heavy traffic has destroyed the edge of paving where these guards have been installed.

Special Tools Facilitate Machining of Bearings

By the Development and Employment of Many Special Tools the Twin City Rapid Transit Company Has Applied Production Methods to the Various Operations of Finishing Bearing Shells



The Joining Surfaces of Axle-Bearing Shells Are Finished on a Surface Disk Grinder at the Rate of 180 Half Shells per Hour

APPLICATION of modern production methods to the various operations connected with machining of axle and armature bearings offers many opportunities for substantial savings in time and costs. In the mechanical department of the Twin City Rapid Transit Company these various operations are laid out with a view toward the efficient use of special machine and tool equipment.

Both solid bronze and babbitt-lined malleable-iron axle bearings are used on this property. In general, it is the practice to use the babbitt-lined malleable type of axle bearing on those motors where the axle and bearing housing diameters are such that the thickness of the metal in the bearing shell is not less than $\frac{7}{16}$ in. to $\frac{1}{2}$ in. With this type of bearing, the malleable shell is lined with about $\frac{3}{16}$ in. thickness of babbitt, and the outside face of the bearing flange is also babbitted. When the motor and axle design do not permit the use of a bearing shell thickness of at least $\frac{7}{16}$ in., the solid bronze type of shell is used.

SPECIAL TOOLS PLAY IMPORTANT PART

In machining both the solid bronze and the malleable shells, the operations are carried out by similar methods, with only such changes as are required by the difference in the materials and the design of the shell. In both cases the various processes are designed to give maximum production with minimum lost motion and handling.

The first operation in machining bronze axle-bearing shells consists in facing off the joining surface on each half of the shell. This is done on a No. 19 Besly surface disk grinder having a disk diameter of 53 in. Across the top of the machine frame two right-angled crossbars allow four groups of shells to be placed on the grinding disk simultaneously. Thus, as two halves are ground against each of the bars, a total of eight halves can be put on the machine at one time. The bearings are simply placed on the face of the grinder and their own weight is sufficient to dress down the flat joining surfaces. The man in attendance keeps the machine filled with bearings and checks the dimensions of those that have been ground so as to make them each as nearly a perfect half as possible. This operation is completed by one man at the rate of 180 half shells per hour, or 90 complete bearings.

After the joining surfaces are finished the next operation is to bore out the interior of the shell. This is done in a horizontal boring mill. A split fitting fastened to the bed of the machine is arranged so that the two bearing halves are securely held together when the cap bolts shown in an accompanying illustration are pulled down. A through boring bar is used and the operation is completed in one cut. The bar is adjustable vertically in the heads of the machine, and by this adjustment the cut is taken exactly in the center of the shell.

TWO HALVES STAMPED TO CORRESPOND

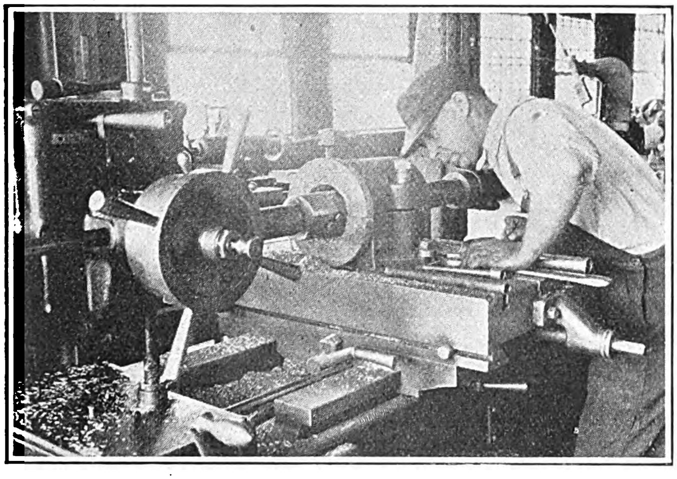
Before the bearing is removed from the boring jig, the two halves are stamped with corresponding numbers, so that they will be kept together during subsequent operations. The next of these is the operation of facing the outside of the flange and rounding the edge connecting this face and the inside bore. This is done in a Warner and Swasey 2A turret lathe. The two halves of the bearing are held together on a mandrel by means of an outside clamp ring. The solid ring is slipped over the bearing, and the two halves are held tightly against the mandrel by means of a setscrew. To accommodate bearings of various sizes of internal bore, special sleeves to fit each different size of bearing are provided for the mandrel. The set-up for this operation is shown in an accompanying illustration.

In the next operation the remainder of the outside of the bearing is finish turned. The two halves are again held on an arbor, but in order to allow the outside circumference to be finished without turning the bearing around to complete the cut, the arbor is arranged so that a clamping nut forces a disk against the end of the bearing and clamps it tightly against a collar on the end of the arbor. Both the disk and collar have knife edges which are forced against the bearing, so that these edges grip the shell and effectually hold the two halves in place. The collar at the flange end is large enough so that its knife edge clears the fillet and bites into the face of the flange. The edges on the disk at the small end of the bearing bite into the metal at the end of the shell. The collar at the large end is a permanent part of the arbor spindle, while the disk at the small end is free to slide on the spindle as the nut on that end is pulled up.

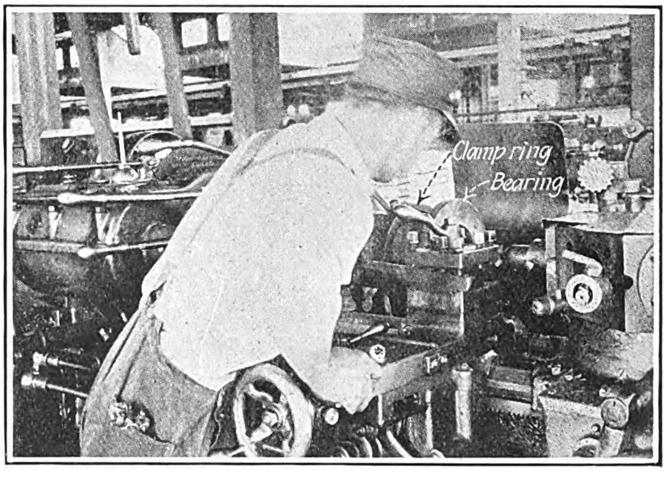
The fifth and last operation in finishing these shells consists of drilling and countersinking the dowel-pin holes. These are located by means of a jig which consists of a large sleeve into which the two bearing halves are placed, so that the split between the two halves corresponds to a scribe mark on the jig. This brings the dowel-pin holes in their proper location.

SIMILAR OPERATIONS ON MALLEABLE SHELLS

Malleable-iron shells are finished in the same general manner as the split bronze type, except for such variations as are incident to the difference in material and design. The joining surfaces of the two halves of the malleable shells are finished on the surface grinder in the same way as described for the bronze shells. The malleable-iron castings, however, have babbitt retaining grooves cast into the inside surface, and this requires an additional operation of grinding the fins from the edges of these grooves.



While the Two Halves Are Held in a Split Jig, the Interior Bore of Axle Bearings Is Finished in One Cut



A Clamping Ring on the Outside Holds the Two Halves of Axle Bearings on an Arbor While Facing the Flange

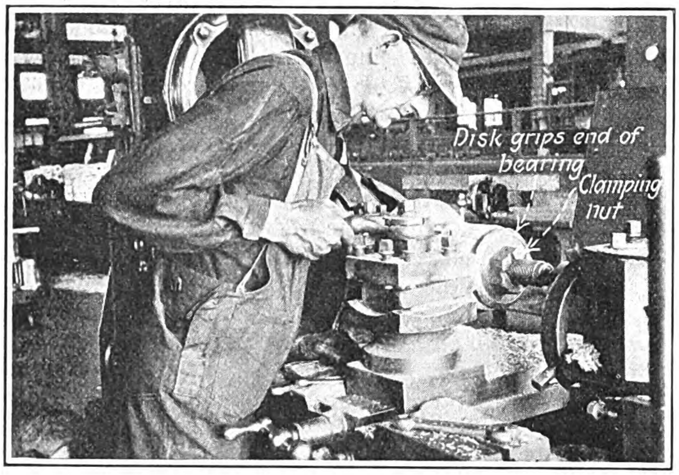
The operation of finishing the face of the flange, and rounding the inside edge, is carried out similarly to the corresponding operation on the bronze shells. In addition, however, a dovetail groove is turned in the face of the malleable flange, to help in retaining the babbitt that is put on this face to take end thrust wear.

After this is done, the small end of the bearing is faced off to remove the fin and square up the end surface. The same type of arbor and clamp that was described for facing the flanges on bronze shells is used for this operation, except that a pin on the arbor projects through the bearing window and helps to drive the casting. This pin is found necessary to keep the shell from slipping on the arbor due to the drag of the heavy cut that must be taken from a rough malleable casting. The pin is not used for finishing the bronze material, as in that case the grip of the outside clamp ring is ample to prevent the bearing from turning on the arbor.

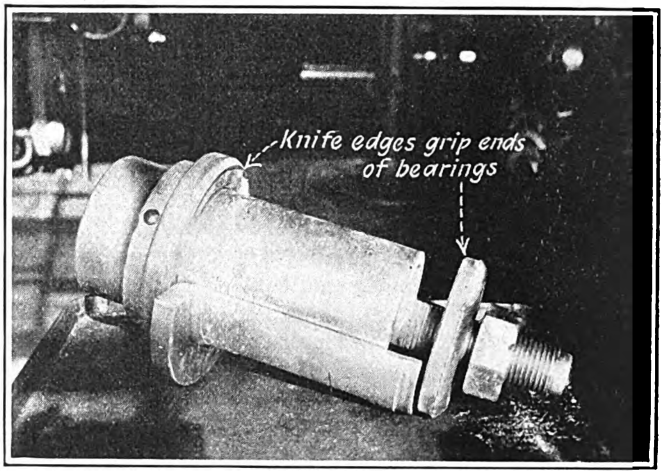
Turning the outside of the bearing to make it fit in the motor housing is the fifth operation on malleable shells. This work, together with that of finishing the inside face of the flange, is performed in the lathe while the bearings are held in place on an arbor by gripping disks on the ends in the same way as was described for bronze bearings. In order to get a firm grip on the harder malleable material, the loose disk is pulled up as tightly as possible with the nut on the arbor and is then rapped with a small hand mallet and the nut again pulled up tight. The next step is to bore out the inside to the proper size after babbitting.

First the surplus babbitt is removed with a coarse file and the mating surfaces are carefully smoothed up so that the bearing will fit into the boring chuck. This is an eccentric clamp chuck and was specially designed for this boring operation. The construction is shown in an accompanying illustration. It will be noted that the body of the chuck consists of a solid steel cylinder. Four heavy pins pass through this cylinder near each end, and are spanned on the outside by two clamping rings, arranged with tapered surfaces in contact with the outside ends of the pins. When the rings are turned through a short distance, the pins are forced in against the bearing and hold it securely in the chuck. The design and arrangement is such that the bearing is accurately centered, thus insuring that the finish bore through the babbitt will be exactly concentric with the shell. The far end of the chuck in the illustration is threaded to fit the headstock spindle of a turret lathe.

With the bearing thus mounted in the turret lathe, the interior bore and the facing operation on the flange are performed at one setting. The short boring tool is carried in the turret, and the facing tool is mounted in the tool post. This facing tool is carefully squared up with the flange, so that the finish cut is made by simply bringing the tool against the face of the flange with the longitudinal hand feed on the machine. The end of the facing tool is hook-shaped as shown in the accompanying sketch, and by moving



The Outside Is Turned and the Inside Face of the Flange Is Finished in This Set-Up



Above, Arbor for Set-Up Shown at the Left. The Two Halves Are Held by Disks Which Clamp Against the Ends

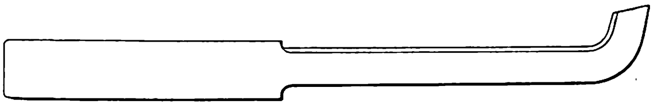
the tool out with the lateral hand feed, the inside edge is quickly finished in practically the same operation as that of facing the flange. The inside bore is finished so that the bearing will just fit a standard plug that is used for checking the size.

On the malleable bearings, as in the case of the bronze shells, the last machining operation consists of drilling the dowel-pin holes. This is done in a jig which is very similar to that described for drilling the bronze shells.

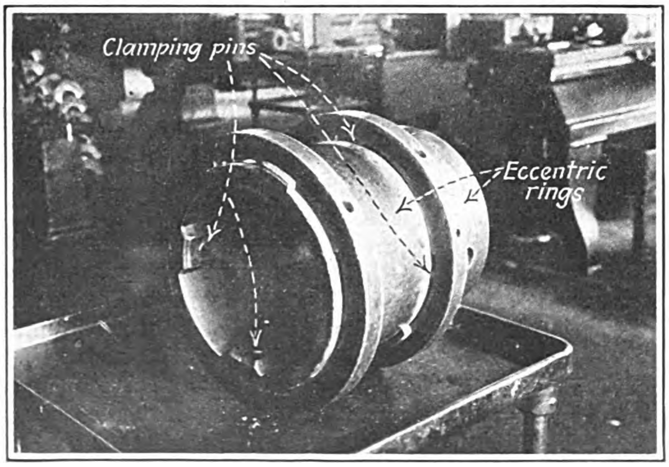
ARMATURE BEARING OPERATIONS SIMPLIFIED

All armature bearings consist of bronze shells cast in one piece, which in some respects lend themselves more readily to efficient machining than is the case with the split shells used for axle bearings. The casting is first chucked by the small end in an independent jawed chuck, which allows the piece to be readily centered in a lathe. With this set-up in a turret lathe, the interior is bored and the outside face of the flange is finished. A ring 1/16 in. deep and 3/16 in. wide is cut into the inside bore of the bearing shell about ½ in. from each end, to help hold the babbitt lining in place.

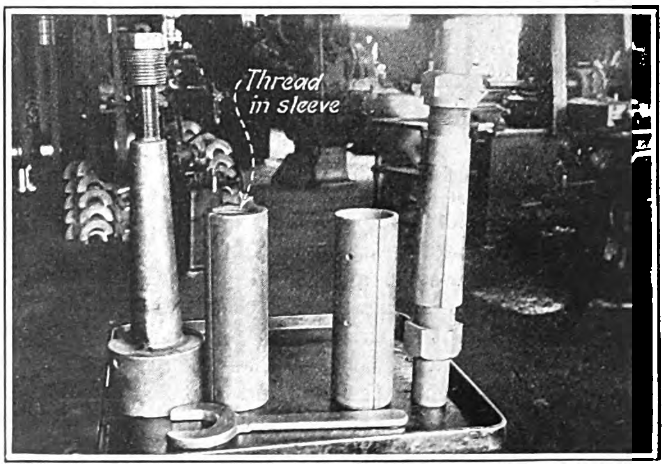
The bearing is next slipped on an expanding mandrel for finishing the outside. This special tool consists of a center spindle having a taper of 1¼ in. per foot, and an expanding sleeve that grips the inside of the bearing. Cast-iron sleeves are made up in various sizes to fit the different-sized bearings. A longitudinal slot about ⅛ in. wide is cut clear through the sleeve on one side, and two slots about 1/16 in. wide are cut into the outside face to within about ⅛ in. of the inside bore of the sleeve. The three slots are equally spaced about the circumference, so that the sleeve can expand when it is forced onto the tapered spindle of the mandrel. A large nut on the small end of the spindle is threaded right hand on the inside and also has a long shoulder which is threaded in the same direction on the outside. Although both the inside and outside threads on this nut are right hand, those on the inside, which fit corresponding threads on the end of the mandrel spindle, are pitched 12 to the inch, while those on the outside are pitched six to the inch. These outside threads fit corresponding threads on the inside of one end of the expanding sleeve. Consequently, when the nut is screwed to the left it forces the sleeve up on the tapered spindle at a rate corresponding to the difference in pitch between the inside and the outside threads, and when the nut is screwed to the right it pulls the sleeve off the taper at the same speed.



The Hook on the End of This Facing Tool Finishes the Inside Rounded Edge Immediately After the Babbitt on the Face of the Flange Is Finished



This Special Chuck Centers the Finished Malleable-Iron Bearings So that the Final Bore in the Babbitt Can Be Made. The Outside Rings Force Pins Against the Shell and Hold It Securely



Expanding Mandrels of Two Types Are Used for Holding Armature Bearings While the Outside Is Being Finished. Left, Mandrel Used in Turret Lathe. Right, in Engine Lathe

A short keyway extending for about 3 in. from the shoulder near the small end of the spindle forms a guide for a short pin projecting from the inside face of the sleeve, and serves to keep the latter from rotating as the nut is turned in either direction.

This expanding mandrel has a large head at the opposite end from the adjustment nut just described, and is threaded on the inside to fit the threads on the turret lathe headstock spindle.

ALSO DESIGNED FOR ENGINE LATHE

When the available turret lathes are crowded with work, it is sometimes necessary to finish armature bearings in an ordinary engine lathe. Under these conditions the work must be done between the centers of the lathe, and a somewhat different type of expanding mandrel is used to hold the bearings. In this type of mandrel a nut is provided on each end, one to force the sleeve on the tapered spindle, and the other to force it off. A keyway the entire length of the spindle keeps the sleeve from turning as it is forced on or off. Although the construction of this type of mandrel is somewhat simpler than the one previously described, the turret lathe method is used whenever machines are available, because it is necessary to remove the mandrel from between the centers of the engine lathe each time a bearing is to be put on or taken off. The entire outside surface of the bearing is finished on one or the other type of mandrel in one operation.

Dowel-pin holes or keyways, depending on the method of holding the bearing in the motor head, are next put in.

After the shell has been babbitted, the last operation consists of boring the babbitt lining to size. This is done on an engine lathe equipped with a universal chuck and a special tool post, which enables a boring bar to be used in the lathe.

New Chicago Multiple-Unit Cars Have Automatic Exit Doors

These New Type Cars of the Chicago Surface Lines Are Designed to Give Maximum Flexibility Either as Single Units or in Two-Car Trains — They Are Arranged for Double-End Operation and Are Equipped with Two 65-Hp. Motors per Car Mounted on Maximum Traction Trucks

A GROUP of 100 new cars for the Chicago Surface Lines on which preliminary specifications were announced in the issue of ELECTRIC RAILWAY JOURNAL of April 12, 1924, are rapidly nearing completion. Some of the cars have already been put in service and it is expected that the entire lot will be on the street in regular operation before the Christmas holiday period.

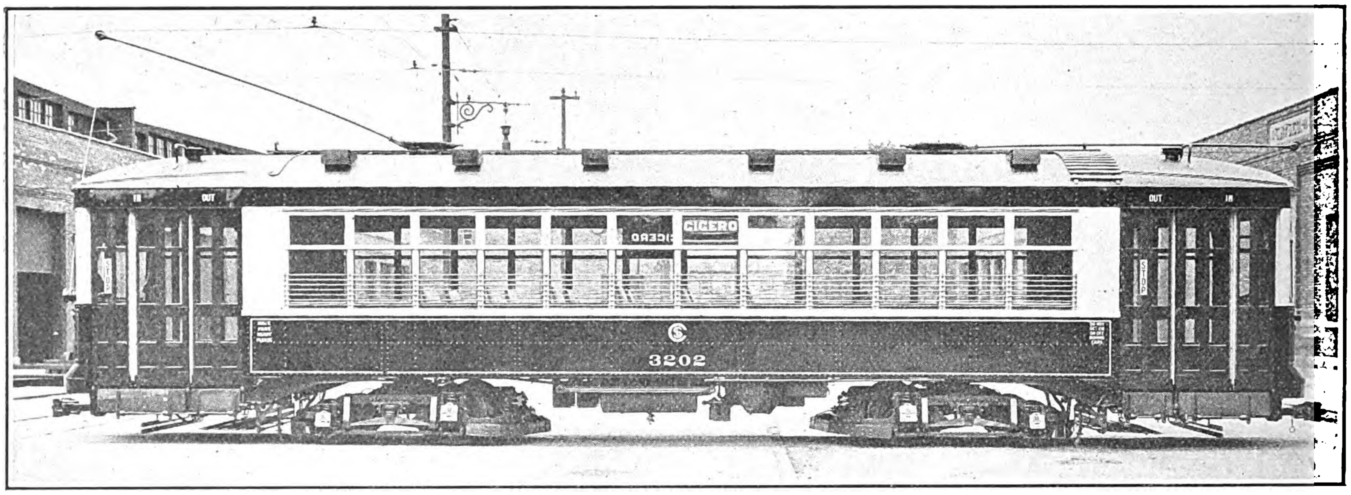
Although the design of this latest addition to the rolling stock equipment of the Surface Lines utilizes many structural features common to other groups of cars built by that property within the past few years, a number of interesting innovations are also incorporated. These include the use of G.E. type M multiple-unit control with two motors per car and maximum traction trucks, and an unusually flexible arrangement of pneumatic door control in which the exit doors are automatically operated by alighting passengers. A similar type of automatic exit door control was installed on a group of 45 double-truck, one-man cars described in the ELECTRIC RAILWAY JOURNAL of Sept. 30, 1922, which have now been in service for a period of more than two years. This latest design, however, represents an extension of the use of the automatic device to cars for service in congested districts either as single units or in multiple-unit trains.

A substantial saving in weight and cost in comparison with four-motor equipment was obtained by the use of two GE-275, 65-hp. motors per car mounted on Brill 39-E maximum traction trucks. The selection of this type of motor equipment instead of four smaller motors per car was also influenced by the desire to obtain rugged, comparatively low-speed machines for the severe service conditions encountered in Chicago. Such equipment gives large-size armature shafts, gears and pinions, and makes the motor parts interchangeable with those used on other groups of cars constructed within the past few years.

Multiple-unit control gives these cars maximum flexibility and permits single units to be operated during non-rush periods and to be readily coupled on the street into trains for rush-hour service without serious delays. Double-end equipment permits them to be operated on lines having stub terminals. Tomlinson automatic car and air couplers facilitate coupling and uncoupling on the street, but the electrical connections between cars are made with flexible jumpers. This application of multiple-unit control marks a further extension of train operation in Chicago, which for a number of years has been carried out with motor cars and center-entrance trailers.

MAXIMUM SPEED IN LOADING AND UNLOADING

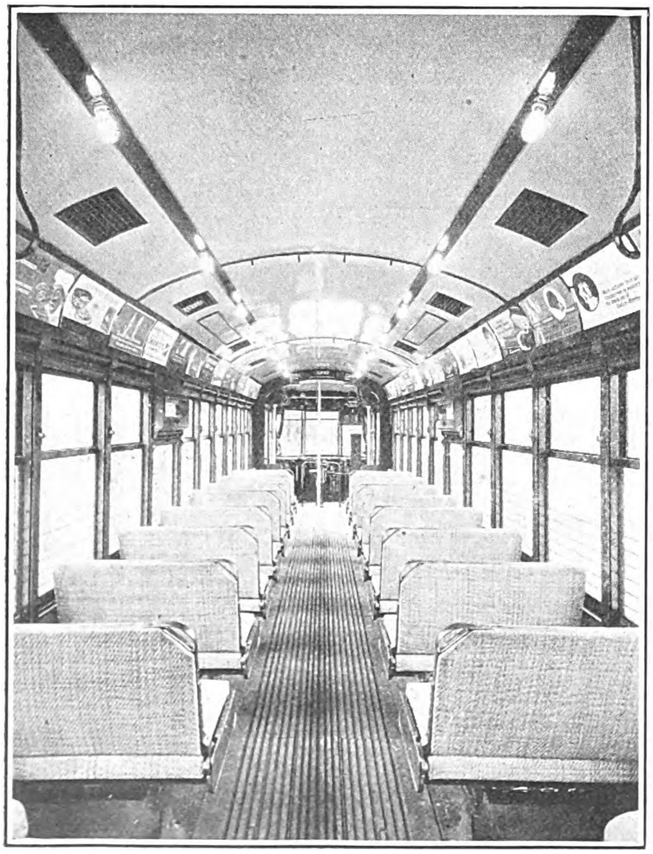
National Pneumatic door-control equipment is arranged to give maximum speed of loading and unloading in either street or subway operation. The door and car control are interlocked to prevent starting with the doors open, and full Safety Car Devices apparatus is also used. Single-car units will be operated by two men. In trains of two cars there will be three men, two on the front car and one on the front end of the rear car. In either direction of operation, the doors at the rear end of each car may be con-



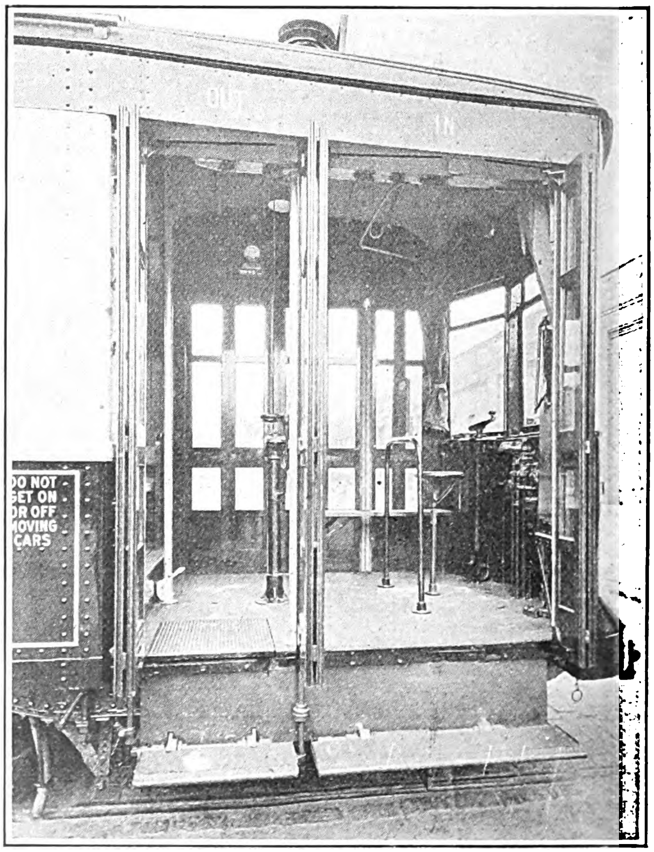
The New Chicago Surface Lines Cars Have Multiple-Unit Control and Are Arranged for Operation Singly or in Trains of Two Cars. Streamline Effect in the Body Gives It a Graceful Appearance

trolled by an operator on either platform, or by street collectors. This allows the rear door of the second car in a train to be opened and closed by the conductor stationed on the front platform of that car or by a man on the street supplied with a key to fit the door-control valve located on the outside near the rear door. The automatic exit doors are located on each platform as shown in the accompanying plan drawing, and those at the front end of each car are operative when the train is moving in that direction.

One of the principal features of the arrangement of doors when the cars are operated in trains is the grouping of the entrances at the center of the train. In other words, passengers enter the front car at the rear end and leave this car at either the rear or the front end, while they enter the rear car at the front end and leave at the same end. When street collectors are available, passengers may also be allowed to enter or alight from the rear end of the second car. This arrangement for loading both the front and rear cars at one point in the center of the train is expected to give more uniform distribution of passengers between the two cars than is obtained where the points of boarding the two cars are separated, as in the case of a rear loading motor car and a center loading trailer. In addition, this design is expected to avoid the delay and confusion resulting from passengers trying to board the train at two different locations.



Simple Lines and Smooth Curves with the Dull Finished Cherry Trimming Feature the Interior of This Car. The Wide Aisle Facilitates Passenger Movement.



The Automatic Exit Doors Are Controlled by a Treadle in the Platform Floor. Passengers Board Through the Door at the Right and Leave Through the Automatic Exit.

The new cars were designed completely by the engineering division of the shops and equipment department of the Surface Lines under the direction of H. H. Adams, superintendent of shops and equipment. Fifty cars are being constructed in the West Shops of the company and the remaining 50 are being built to Surface Lines specifications and drawings by the Light-Weight Noiseless Electric Street Car Company in St. Paul, Minn. The two groups are identical in construction and all parts of the equipment and structure are being made as nearly interchangeable as possible to facilitate maintenance and repair. The general appearance corresponds with the arch-roof cars now in service on the Surface Lines and, as in former groups of cars, careful attention has been given to the matter of improving the appearance by giving the body a streamline effect.

Minimum weight consistent with the severe service conditions encountered was another objective in the design. The complete cars weigh 41,000 lb. each. This weight is distributed between car structure and equipment as follows:

The Treadle Mechanism for Controlling the Automatic Exit Door Is Connected with the Step so that the Door Remains Open Until the Alighting Passenger Steps Off to the Street

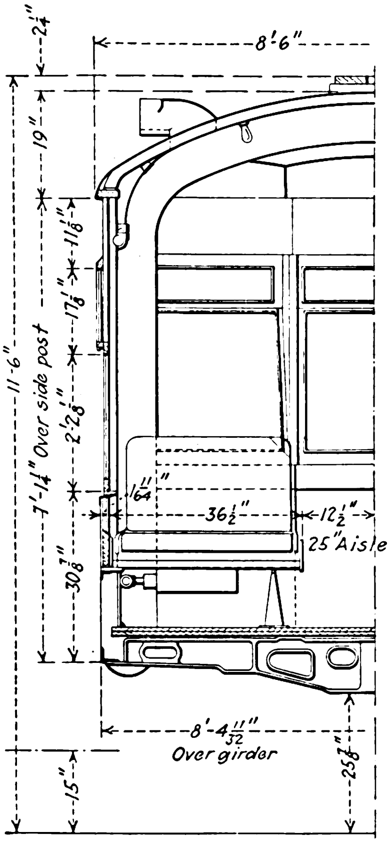
	Pounds
Car body	14,100
Trucks without motors and gears	11,280
Motors and gears	5,000
Electrical equipment	3,100
Air brakes, hand brakes, door equipment, couplers and piping	5,250
Body and vestibule seats	1,350
Sign boxes, register equipment, curtains and miscellaneous accessories	920
	41,000

The general dimensions are shown in the tabulation below:

Length over bumpers	48 ft. 11 in.
Length over corner posts	32 ft. 9 in.
Width over all	8 ft. 6 in.
Seating capacity, first car	51
Seating capacity, second car	54
Width of aisle	25 in.
Door opening in clear, rear entrance of front car and front entrance of rear car	40 in.
Door opening in clear, rear exit of front car and front exit of rear car	23½ in.
Door opening in clear, front exit of front car	62 in.
Height, rail to trolley board	11 ft. 6 in.
Height, rail to floor	37½ in.
Height, rail to side sill	31½ in.
Height, rail to step	15 in.
Height, step to platform	13⅞ in.
Height, platform to body floor	8⅝ in.
Side-post centers	29½ in.
Truck wheelbase	4 ft. 10 in.
Truck centers	22 ft.

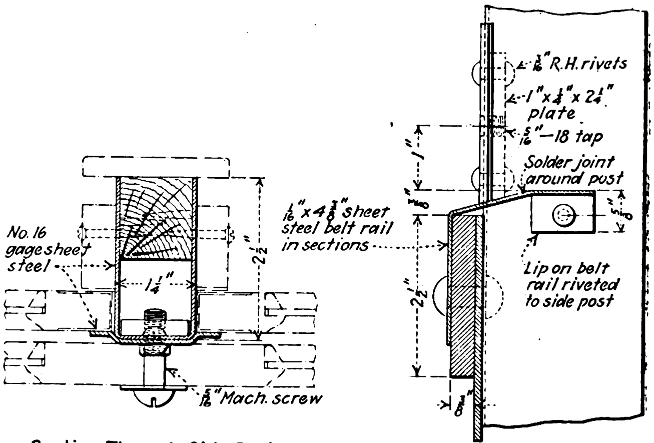
American Electric Railway Engineering Association standard parts and recommended dimensions have been used as far as possible throughout the body structure and equipment.

The side girder plates are made of No. 12 gage steel. Each side is reinforced at the lower edge with 3-in. by 2-in. by ⅜-in. angles and at the top edge by the belt rail, formed of $\frac{1}{16}$-in. sheet steel and further reinforced with a 2½-in. by ⅜-in. bar. Seat support angles 1½ in. by 1½ in. by ⅛ in. are placed longitudinally half way between the bottom and top edges of the girder and are cut for the side posts. These are formed of $\frac{1}{16}$-in. sheet steel and correspond in design to the side posts used in the group of 45 one-man double-truck cars described in detail in this paper, issue of Sept. 30, 1922.



Cross-Seats Are 36½ In. Wide, and for an 8-Ft. 6-In. Over-all Width an Aisle Width of 25 In. Is Obtained by Making the Wall Thickness Below the Belt Rail Only 1 11/64 In.

Drop-type platforms are carried on 8-in., 13.75-lb. channel platform knees, reinforced at the point of greatest stress by web plates and angles. Bumpers are 7-in., 12¼-lb. channels with the flanges turned in. The end sills consist of 9-in., 15-lb. channels secured to the side structure with gusset plates. Channels are used for the main body cross-sills and are of 4-in., 5¼-lb. section. The underframe is rigidly braced with diagonal members, as shown in the accompanying drawing of the construction of this part of the framing.



Section Through Side Post

Section Through Belt Rail

Pressed-Steel Side Posts Are Used. The Belt Rail of Pressed Steel Is Reinforced with a Flat Bar at the Upper Edge of the Side Girder

A combination of flat steel and wood carlines is used to support the roof in a manner similar to that which has been standard construction with the company for several years. The roofing material is ¼-in. Haskelite and the headlining is ¼-in. Agasote. Other details of the body structure and framing are very similar to a former group of 169 cars described in this paper for Sept. 8, 1923.

Car wiring both for control and auxiliary circuits is carried in "Duratube" except where exposed to abrasion or direct wheel wash, where it is put in aluminum conduit. The main motor cables are inclosed in "Duratube," cleated under the center of the car floor. The floor is carried continuously between trapdoors for a space about 8 in. wide, and this allows the cables to be carried past the trapdoor openings with no special provision for extra protection at this point. Aluminum motor junction boxes are used, and the heater wiring

SPECIFICATIONS FOR THE NEW CHICAGO MULTIPLE-UNIT CARS

Air brakes	G.E. CP-27, 16 cu.ft. capacity
Compressor	G.E. Type
Control	G.E. Type M light-weight
Trucks	Brill 39E-2x, maximum traction
Roof, ¼-in Haskelite covered with No. 8 National prepared roofing	
Headlining	¼-in. Agasote
Interior trim	Cherry, stained dark with rubbed finish
Signal bell	Consolidated single stroke bells
Buzzers	Consolidated
Trimmings	Statuary bronze
Center bearings	Surface Lines standard plain type
Side bearings	Stucki
Conduits	Duratube and aluminum
Couplers	Tomlinson automatic car and air
Curtain material	Fabrikoid, double faced
Curtain fixtures	Railway Supply & Curtain Co. No. 30 "Duquad"
Destination signs	Hunter illuminated
Door-operating mechanism	National Pneumatic with interlocking control and automatic exits
Wheelguards	H-B Lifeguards
Hand brakes	Pittsburgh No. 35, drop handle
Hand straps	Rico sanitary No. 7
Heater equipment	Consolidated
Headlights	Trolley Supply—Surface Lines standard
Meters	Economy
Motors	Two G.E.-275, 65 hp.
Paint	Chicago Varnish Company and vitrolite enamel
Rails and stanchions	Aluminum
Registers	International R-7 and B-13 backs
Sand traps	Electric Service Supplies
Sash construction	Wood with brass channel on stiles
Sash fixtures	O. M. Edwards with lock on one side of sash and compression brake on opposite side
Seats	St. Louis
Step treads	Kass
Thermostat	Railway Utility

Trolley base	US-14
Trolley wheels	Railway standard 5-in.
Ventilators	Railway Utility with compensating intakes
Wheels	28-in. and 21-in., rolled steel
Window wipers	Railway type, hand operated

along the truss plank on the interior of the cars is carried in aluminum conduit.

In one sample car of this group "Romex" cables and wiring were used. In this installation the insulated conductors are inclosed in fabric covering woven directly over the conductors and then coated with flameproofing and waterproofing compound. This type of wiring was put in to obtain more experience with this material, which is believed to come within the tentative rules for car wiring presented by the 1924 A.E.R.E.A. committee on car and carhouse wiring.

Complete specifications for materials and equipment used on these cars are given in the table on the preceding page.

Thermit Process Gives Good Results in Youngstown

This Method Is Used in the Installation and Repair of Crossings, Switches and Mates, Compromise Joints and Other Special Work—It Has Been the Standard of the Company Since 1916

By D. J. Graham

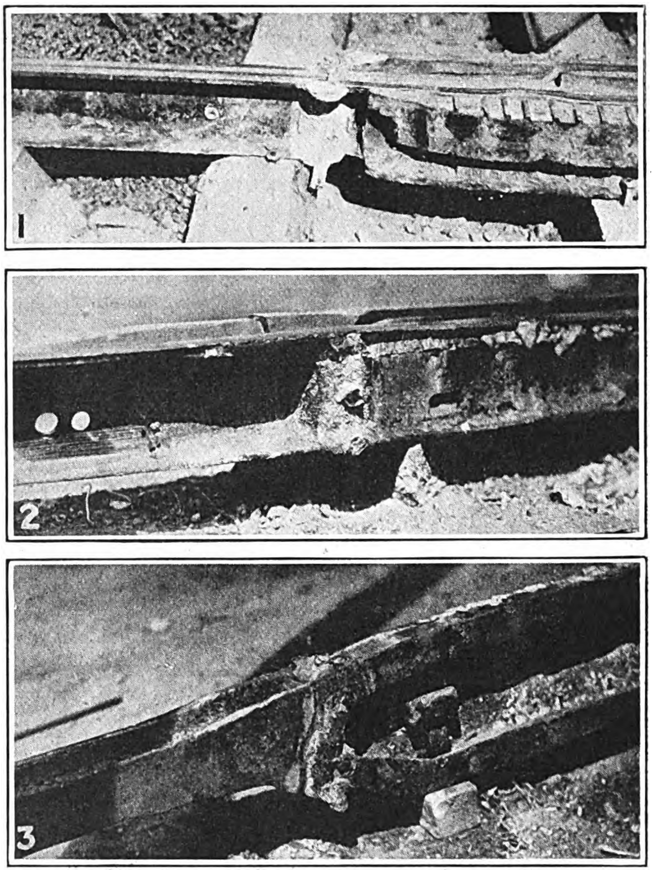
Engineer of Maintenance of Way Youngstown Municipal Railway, Youngstown, Ohio

DURING the past eight years, approximately, 8,000 thermit-welded joints have been installed by the Youngstown Municipal Railway and to date only seven joints have failed. From investigation of the failures it was found that in most cases the break was due to faulty pouring, improper preheating of rails, or neglect in setting the mold boxes in the center of weld. In 1916 thermit-welded joints were adopted as standard practice for all types of new track construction. At first this method of welding was used for joints only, but gradually it has been developed to a point where it is used for other purposes, such as repairing switches, crossings, compromise joints, and other special trackwork.

An example of its efficiency in this respect is the repair work recently performed on a mate of solid cast-steel construction. A 12-in. piece of guard rail on the point end of a mate broke out, and as the mate itself was only partly worn, it was decided to make repairs on the job. The mate was cut off back of the break and a new piece of guard rail butted against the remaining end and welded to it by the thermit process. This was done during the night when service was suspended and was completed at a very reasonable cost. An additional life of approximately 5 years resulted. The accompanying itemized tabulation of the cost of the job shows the economy of performing this work in the street.

COST OF REPAIRS

Labor (One foreman, 70 cents per hour; one helper, 66 cents per hour; one truck driver, 50 cents per hour)...	$ 7.00
Welding, sand and wax	.45
Thermit metal	13.85
Gasoline for preheating	.30
Power for preheater and grinding	.85
Gas and oxygen for cutting	.35
Brick, sand and cement	1.85
18 in. of second-hand guard rail	.65
Total cost	$25.30

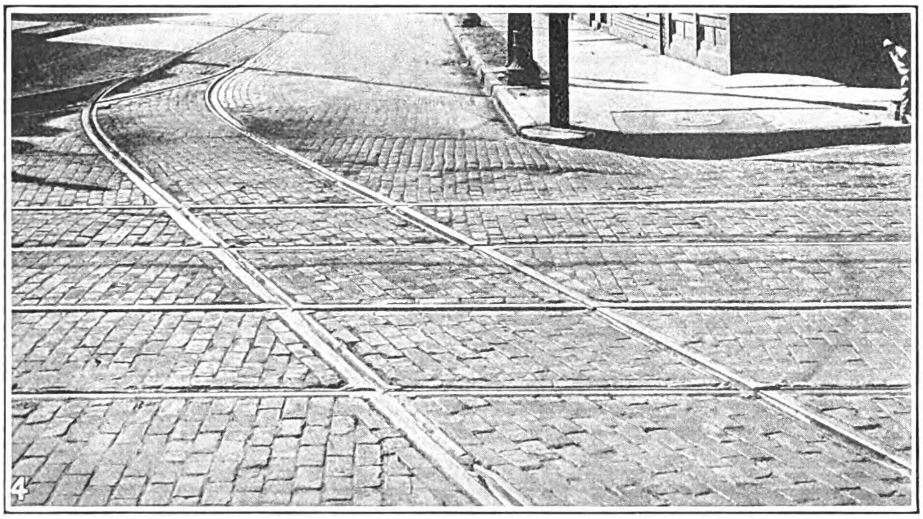


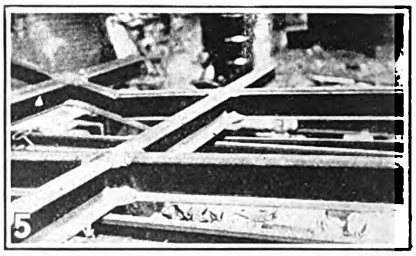
How Switches Are Repaired

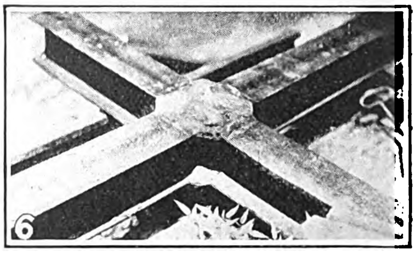
No. 1. Broken switch repaired with thermit weld.
No. 2. Side view of switch casting repaired with thermit.
No. 3. Bottom view of the same switch casting showing filled out break in casting.

This type of reconstruction work is used in repairing frogs and switches with the same economical results. Fig. 1 shows a switch that was taken out of the scrap pile, repaired with the thermit weld, and placed in a diamond turnout where the old switch went to pieces. This repaired switch is now in service and will probably last for two or three years. Other examples of special applications of thermit welds are shown in Figs. 2 and 3, which illustrate the side and bottom views of a switch which was broken through the casting. These indicate how the weld was placed at the break uniting the two ends and making the switch casting as solid as originally. Ordinarily this piece of special work would have been scrapped, but instead it was repaired in the shop and placed in use at another location.

In addition to repair work, thermit welds are used on all new crossing work. On a double-track crossing made



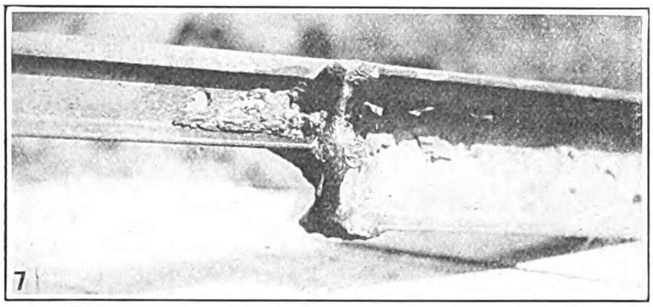


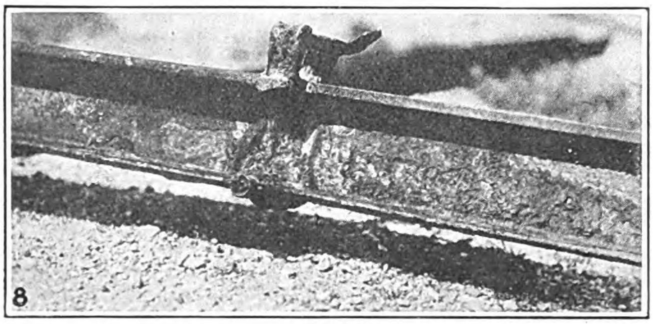


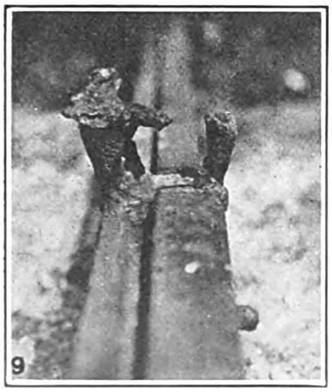
Examples of Thermit-Welded Special Work

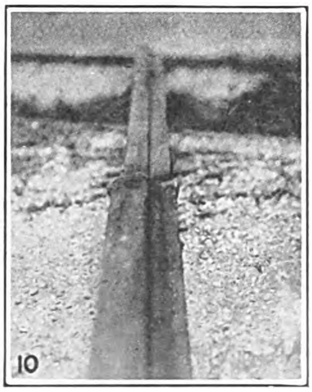
No. 4. Thermit-welded frogs installed at single-track double-track crossing. No. 5. Top view of crossing, showing weld at rail intersection and flangeways built in by arc welding to give continuous flange bearing. No. 6. Bottom view of same weld showing continuity of joint and clean appearance.

with Lorain Steel Company's rail section 132-440, the frogs were welded into position by means of thermit metal. Intersections of the flangeways were built up with an electric arc welder and ground with a rail grinder so as to make a taper flange bearing over the intersection. A crossing of this kind installed more than three years ago is in perfect alignment and rendering good service today.









Compromise Joints Made by Thermit Process

No. 7. Compromise joint from L. S. Co. 90-206 to 70-lb. A.S.C.E. T-rail.

Nos. 8, 9, 10. Compromise joint between L. S. Co. rail sections 103-478 and 73-291.

A similar crossing was built of Lorain Steel Company's rail section 103-478 with the frogs built up of thermit metal. In this case the flangeway of the crossing was built up with arc welding in order to make a continuous flange bearing over the entire crossing. Figs. 5 and 6 show a top and bottom view of this crossing, illustrating the manner of welding and the uniform appearance of the bottom and top of the rail.

All compromise joints are made by means of the thermit process. This type of construction is shown in Fig. 7. Other illustrations of compromise joint welds are shown in Figs. 8 and 9. A finished joint which has not been ground and needs no grinding on account of the perfect surface and gage alignment retained in making the weld is shown in Fig. 10. Renewing plates, tightening of bolts, broken bonds, and building up cups, are items of expense that do not exist with welded compromise joints, but which are important where other methods are used. The original cost of the two types of joints is approximately the same.

CAREFUL INSTALLATION IS IMPORTANT

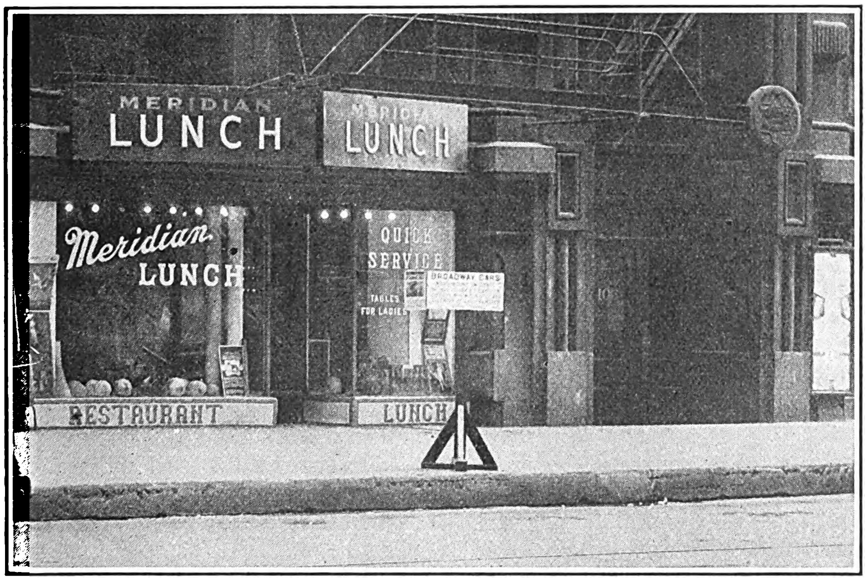
Thermit welds are used on both Lorain Steel Company's rail sections 132-440, 9-in. rail and on 103-478, 7-in. rail. An inspection of joints installed seven years ago which had developed a few small cups afforded an indication of how faulty workmanship in placing the metal has a detrimental effect on the life of the joint. On this particular piece of track, the regular man doing the original grinding had been replaced by another. After grinding through the cupped section, it was discovered that improper grinding had been done at the time the joint was installed. This was thought to be the cause of the failure of the joint. Where the work of preparing and welding the joint and finishing is carefully done long service may be expected.

Of the 4,500 buses owned by the London General Omnibus Company about 7 per cent are normally out of service—5 per cent for the daily inspection and greasing, and 2 per cent for accidents and annual overhaul.

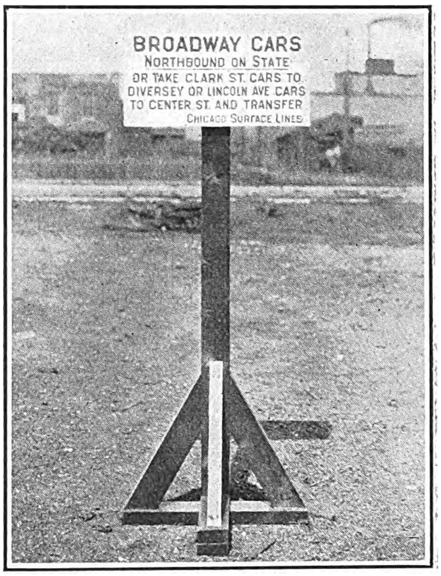
Chicago Surface Lines Reroutes 1,600 Cars

Widespread Changes in Schedules and Operating Routine Required by Adoption of New Plan to Relieve Congestion — Public Advised by Liberal Use of Paid Publicity

TAKING the lead in the attempt to relieve the notoriously congested conditions in Chicago's business district, known generally as the "Loop," the Chicago Surface Lines has put into effect a complete rerouting plan for its cars. This plan, which was described and discussed in detail in the ELECTRIC RAILWAY JOURNAL of May 3, 1924, page 683, is the result of more than a year of study on the part of engineers representing the city, the companies and the Illinois Commerce Commission. The detailed plan was submitted to the local transportation committee of the Chicago City Council in the form of a report by its transportation engineer, Major R. F. Kelker, Jr. The final rerouting by the Surface Lines was put into effect by an order from the Illinois Commerce Commission and was carried out a month in advance of the requirements of the order.



Type of Sign, Mounted on Standards, Used at Important Intersections to Advise Passengers of Changes in Routes



BROADWAY CARS
NORTHBOUND ON STATE
OR TAKE CLARK ST. CARS TO
DIVERSEY OR LINCOLN AVE CARS
TO CENTER ST. AND TRANSFER
CHICAGO SURFACE LINES

Close-Up View of the Sign and Stanchion Used in Chicago

Approximately 1,600 cars on 35 different lines are affected by the changed routing. Sweeping revisions of schedules, transfer of cars between terminals, increases in the number of cars assigned to some terminals and decreases in others, transfers of men between terminals, changes in switches throughout the loop district, more than $100,000 of additional trackwork in the form of new loops to eliminate stub terminals and instruction of men to make them familiar with new routes have been some of the widespread operating problems to be solved in connection with the change.

In general the new routing is based on the elimination, as far as practicable, of traffic interference due to the turning movement of street cars in the business district. Left-hand turns were considered to be most objectionable, since each such turning movement temporarily interferes with traffic in both directions. Right-hand turns were considered next objectionable because such turns temporarily interfere with two lanes of traffic. Straight crossings, of course, offer the least interference.

The new plan combines certain lines so as to furnish additional through routing, removes unimportant lines from the business district and eliminates turning movements in this district by bringing cars in on one street and out on another, completing the loop outside the business district. North-and-south lines are carried through the business district before making loops. Not only are turns in the business district eliminated in this way, but a largely increased service is furnished between the north and south boundaries of the business area.

Dearborn Street, which has never been a through street for north-and-south lines, has been made a turning street for lines to and from the west side of the city. This has made necessary the use of a walking transfer between these west side lines and the north and south lines on State Street.

In addition to the track changes outlined in the previous complete description in the JOURNAL of the proposed new routing, many changes in switches in the loop area were required. This included changes to approximately 100 mechanical switches, the removal of 25 electric switches and the installation of 21 electric switches in new locations. Lever type switches were installed at all points facing crossings with straight track.

Trainmen were supplied with maps and folders some time in advance of the change and were told that it would be necessary for them to be able to pass an examination on the new routes, so that they would be qualified to answer questions on the part of the public. In addition, those men who were assigned to new through-route runs which would take them into unfamiliar sections of the city were required to ride over the proposed new route and to sign registration books at the terminals at the far end of the line, indicating that they had completed the trip. Special instruction was given to men newly assigned to service on runs making trips through the tunnels under the Chicago River, in order to make them familiar with the rules for such operation.

Approximately 140 men were voluntarily transfered between stations because of changes in car assignments. Under the labor agreements existing in Chicago, this meant the sacrifice of seniority rights for picking run assignments, on the part of these men. Schedules on all the affected lines were completely remade and were placed in the hands of division superintendents in time to allow men to pick new runs and receive proper instruction relative to the new routes.

Three million folders giving the details of the new routes were distributed direct to the public through folder pockets in the cars, hotels, banks, department stores and large industrial and commercial institutions in the city. Printed maps showing in detail the exact routing of each line through the business district were supplied to trainmen and other employees, to traffic officers of the city and to others interested in the details of the new routes. These maps were also furnished to the public on request.

In addition to this directly distributed material, cards were carried in all cars calling attention to the proposed changes in routing. A list of the changes was published in paid advertising space in all the metropolitan newspapers and in the daily foreign language press.

Thirty standards carrying conspicuous signs were placed at important intersections in the business district to direct passengers who had not become familiar with the changes through the other publicity material issued.

A total of 5,847 right-hand turns in the business district per day have been eliminated. Also, 5,381 left-hand turns and 988 stub terminal movements have been done away with. It is estimated that intersection interference between street cars has been reduced 27 per cent.

The complete change-over was made at midnight on Sept. 13. Plans had been carefully laid in advance and all instructions issued so as to make the changes with the minimum confusion. At this time the necessary changes in the connections of electric switches were made.

The final success of the new routing in reducing traffic congestion depended on subsequent regulation of other traffic movement. The Chicago Association of Commerce, as the result of studies made by its traffic committee, took official action in favor of eliminating both turning movements and parking of automobiles within the congested area in the business district. It has been pointed out by the Surface Lines that its cars constitute only 10 per cent of the number of vehicles using the streets of the business district, but that they carry more than 75 per cent of the people who ride in this area. It was contended, therefore, that the full benefit of the new plan in improved service, as well as the elimination of congestion and danger to pedestrians, could only be realized with the similar scientific routing of other vehicles using the streets.

A short trial period with the new routing of cars convinced the city authorities that an even greater improvement would be obtained by the elimination of turns in the congested district by other vehicles. Regulations eliminating left-hand turns entirely at most of the important intersections within the Loop were consequently adopted and put into effect. This has improved the conditions to such an extent that the Surface Lines are now engaged in a further study of the resulting effect on street car movement, looking toward a revision of schedules that will take advantage of the reduction in congestion to effect a saving in time for the 75 per cent of Loop passengers who ride the street cars.

The Readers' Forum

Say In Situ Treatment Is Used on 250 Miles of Track

MESSRS. C. P. SANDBERG
Consulting and Inspecting Engineers
40, Grosvenor Gardens,
LONDON, S. W. 1

Nov. 3, 1924.

To the Editors:

The Foreign Report Number of the ELECTRIC RAILWAY JOURNAL of Sept. 20, 1924, contains the advance publication of the report of the American Electric Railway Association committee on foreign operation. The observations of the committee, as expressed in the summary and also in the main report in regard to the operation of British tramways, are both cogent and intimate, and form a valuable record of the opinions of the managements of the undertakings dealt with. The report is discriminating and, as is only to be expected in a document of this kind, prominence is given throughout to the special features which obtain on the several tramways visited. On the whole the committee is to be congratulated upon its presentation of the situation in each tramway district visited, and there can be no doubt that the information published will be quite as interesting to British tramwaymen as to their confrères in the U. S. A.

It is only to be expected that minor errors have not been avoided, and our attention has been called to the observations of the committee in regard to the Sandberg *in situ* rail hardening process. In the summary it is stated that the *in situ* treatment of rails is still in the experimental stage, and in the body of the report the article on *in situ* treatment of rails expresses the opinion that British "experience is not yet of sufficient amount to provide any definite opinion as to its merits . . . and the best that can be said for it up to date is that the results have been sufficiently good that some of the tramways are making further installations as a means of gathering further data." It would appear that these observations are based solely upon the limited amount of rail treated to date on the tramways within the London area which, owing to the destructive effect of the magnetic track brake, has been, as stated, on an experimental scale.

The Sandberg *in situ* rail hardening process has, however, long since passed the experimental stage. Since its introduction six years ago over 250 miles of track have been treated in Great Britain. The process is now being developed on the Continent and in the Dominions. A number of important British tramways have adopted the process as part of their regular maintenance operations, and it will be of interest to observe that the Leeds, Liverpool and Manchester Tramways have had 25, 30 and 46 miles of track treated respectively, and a number of other systems have each placed repeat orders for the treatment of upward of 10 miles of track.

The resistance of treated rails to wear is very much greater than that claimed in the committee's report, as is shown by the following calculation based upon the average results of 30 sets of gagings taken upon representative tramways in the United Kingdom, after the passage of 2,400,000 tons (English) of traffic in each instance:

Average wear on untreated rails, 0.0398 in. per 2,400,000 tons (Eng.)
Average wear on *in situ* treated rails, 0.0173 in. per 2,400,000 tons (Eng.)
Average wear on untreated rails = 2.3 times that on *in situ* treated rails
With a $\frac{3}{16}$ (0.1875 in.) depth of *in situ* treatment at the above average wear (0.0173 in.), treated rail would last .... 10.83 years
At the above average wear (0.0388 in.) $\frac{3}{16}$ in. untreated rail would last .... 4.71 years

Severe tests were carried out by the London County Council Tramways over a period of about 3 years in order to ascertain the resistance to corrugation of rails treated by the Sandberg *in situ* process. During this period the test rails both treated and untreated were traversed by 2,092,000 cars (33,000 lb.) or approximately 31,000,000 tons (English), and corrugations were removed on three occasions from the untreated rails while the rails treated by the Sandberg *in situ* process remained free from corrugations throughout the test. Similar proof of the resistance to corrugation of the treated rails has been obtained from numerous other undertakings. It will be seen from this information that very definite advantages are being derived from the Sandberg *in situ* process and that it is now extensively established in Great Britain.

C. PETER SANDBERG.

Mitten Management Considers Changing Philadelphia Wage Basis

PHILADELPHIA RAPID TRANSIT COMPANY

PHILADELPHIA, PA., Nov. 10, 1924.

To the Editors:

Your editorial in the Nov. 1 issue, regarding the method of determining street railway wages, is a heartening indication that the industry is awakening to the importance of its most vital problem. It occurred to me that you might be interested in having the viewpoint of Mitten Management on this subject.

Wages will never be properly adjusted in any industry so long as the primary object of the employer is to receive the utmost service which he can coax from the employee for the lowest possible wage; nor while the only aim of the employee is to receive the highest possible wage for the least possible work. There must be a just recognition on the part of each of the rights of the other, and a joint appreciation of the rights of the consumer, who pays both dividends and wages.

Mitten Management believes that it has found the solution of the wage problem, basing its belief on the fact that it is now rendering in both Philadelphia and Buffalo a strike-proof service, with a satisfied body of men who recognize that higher wages can only come through greater effort on their own part. This is accomplished by a plan with which you are no doubt familiar, under which the men are made partners with the management. The latest step in the plan as applied in Buffalo is contained in the inclosed Tulley Talks No. 21, which is issued today. (Published below.)

The wages of P.R.T. employees are based on the average of those prevailing in Detroit, Cleveland and Chicago. We have long recognized the inadequacy of this method of arriving at a base, because each of these cities determines its wages upon successive strike-threats and arbitration. We have now under careful consideration a plan to base the wage in Philadelphia on the purchasing power of the dollar, continuing our policy of giving the men full opportunity to secure, in higher wage, the benefit of their greater effectiveness, which is further encouraged by the investment of this added wage in the securities of their company, whose value and dividend-paying ability is thus practically underwritten by them.

J. M. SHAW,
Editor *Service Talks.*

How I. R. C. Employees Can Best Lend Their Aid

(From "Tulley Talks" No. 21)

Mitten Management is deeply grateful for the offer of support from I.R.C. employees in meeting the financial burden of the recent Niagara Falls high-speed accident, but does not feel that such sacrifices will be necessary at this time. There is a way, however, by which I.R.C. employees can aid the management without calling upon funds which are necessary to meet the needs of their adequate living and saving.

I.R.C. employees are already partners with I.R.C. management, by virtue of the investment of part of their 1924 wages in I.R.C. bonds and stock. The wages of the men are now 57½ cents per hour, 2½ cents of which is paid into the co-operative wage fund administered by elected trustees and invested in the company. The full wage agreed upon for 1924 will be paid, and the management plans, with the continued co-operative effort of I.R.C. employees, to make possible a further increase in the basic wage rate.

Mitten Management now suggests that the basic wage rate for 1925 be continued at 57½ cents per hour, and that 2½ cents of this amount be used, as now, for the purchase of I.R.C. securities by the trustees of the wage fund, and further that after I.R.C. earns and pays the 5 per cent interest on its I.R.C. bonds, an additional wage of 3 cents per hour be then added; the full amount of this added wage—a total wage of 60½ cents per hour—to be paid during 1925, or as soon thereafter as the company's financial condition makes such payment possible.

What is done with this added wage will of course lie entirely with the employees, but the management strongly recommends that it be placed in the co-operative wage fund, and that it be invested in I.R.C. bonds and stock, in furtherance of the policy of employee-ownership which has so far helped keep International on an even keel, and will, we are confident, eventually put I.R.C. upon a safe and dividend-paying basis.

This proposal is to be now placed before the general committees, and if approved by them will be submitted for the signed approval of all employees. By accepting this proposal and thus underwriting the payment of the interest on I.R.C. bonds, and by directing their trustees to invest in I.R.C. bonds and stock the 10 per cent added wage over the 55-cent rate now being paid, I.R.C. employees can best lend their aid, and bring themselves into still closer partnership with the management.

A Suggestion About Whistles

THE OHIO BRASS COMPANY

MANSFIELD, OHIO, Oct. 31, 1924.

To the Editors:

We have received a letter from one of our customers (J. C. Schade, manager railways Wisconsin Public Service Corporation, Green Bay, Wis.), asking if we can furnish some kind of a chime whistle to replace the shrill whistles now on their line.

This incident suggests a thought that you might feel worth passing on to the industry. Place in the car a blank on which passengers are requested to write any criticisms that they may have on the service, stating what if anything connected with the ride is annoying, uncomfortable or distasteful. I know from personal experience that one interurban company has its cars equipped with whistles that will give one a headache within a 30-mile ride. There are other discomforts on many lines that could be eliminated and would be, if the management knew how they unconsciously move the patron to avoid riding on the traction lines.

JAMES H. DREW,
Manager Line Material Division.

Equipment Maintenance Notes

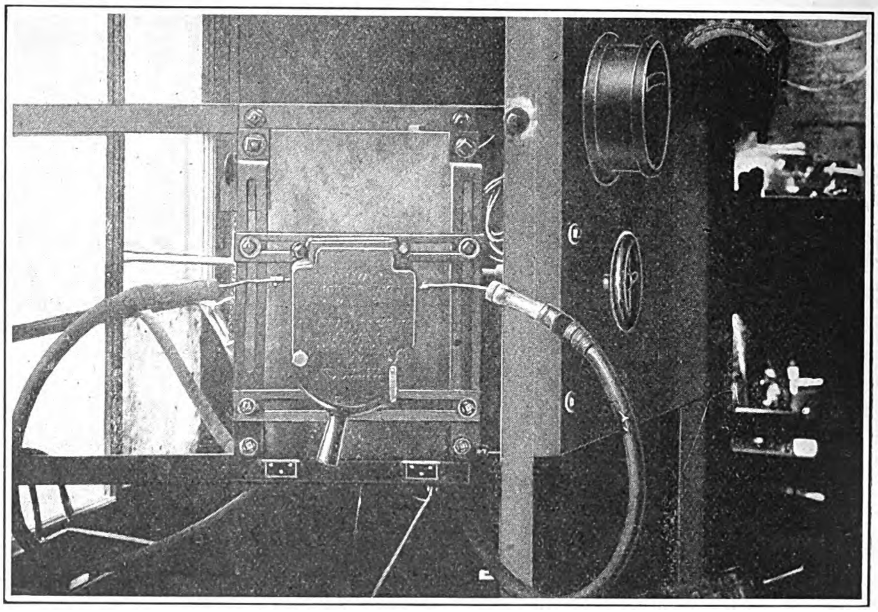
Shop Testing of Circuit Breakers

By F. C. Lynch
Shop Supervisor Kansas City Railways

IT IS the practice of the Kansas City Railways to set car circuit breakers at 150 per cent of the full load rating of the motors. In the past it has been found that unless these settings are carefully checked in the shop, there is a tendency on the part of operating forces to screw the settings up so high that the breaker does not operate even on severe overloads. This condition causes very high maintenance on electrical equipment.

A general mechanical department order issued to all maintenance departments shows the correct setting for each type of equipment in service. The divisions are not permitted to change the settings of breakers in service, but are instructed to return those thought to be incorrectly set to the shops, where all adjustments are made.

To do this work accurately in the shop, the test panel shown in the accompanying illustration has been provided. In addition to the panel itself, containing the various instruments required to check the setting at which the breakers open, a special type of mounting frame is provided for supporting the breakers in a position corresponding to their mounting on the various types of cars.



It Is the Practice of the Kansas City Railways to Make All Circuit Breaker Adjustments in the Shop. The Mounting Rack Shown Is Arranged so that the Breaker on Test Can Be Supported in Either a Vertical or Horizontal Position, Corresponding to the Position in Which It Is Mounted on the Car

The mounting frame is shown in the center of the illustration, with a circuit breaker in position for testing. It will be noted that vertical and horizontal straps contain long slots, so as to allow different types of breakers to be mounted readily. In addition to this, the board on which these straps are carried is hinged at the bottom and held by a catch at the top, so that the breaker can be supported for testing, in either a vertical or horizontal position.

The settings used for breakers on the various types of electrical equipment in service in Kansas City are shown in the accompanying general maintenance order issued by the mechanical department to cover this detail of practice.

KANSAS CITY RAILWAYS COMPANY
MECHANICAL DEPARTMENT

Subject: *Circuit Breaker Setting*

General Order No. 77

All circuit breakers will be adjusted and set at the shops, and will be pinned so that the setting cannot be changed.

The settings will be as follows:

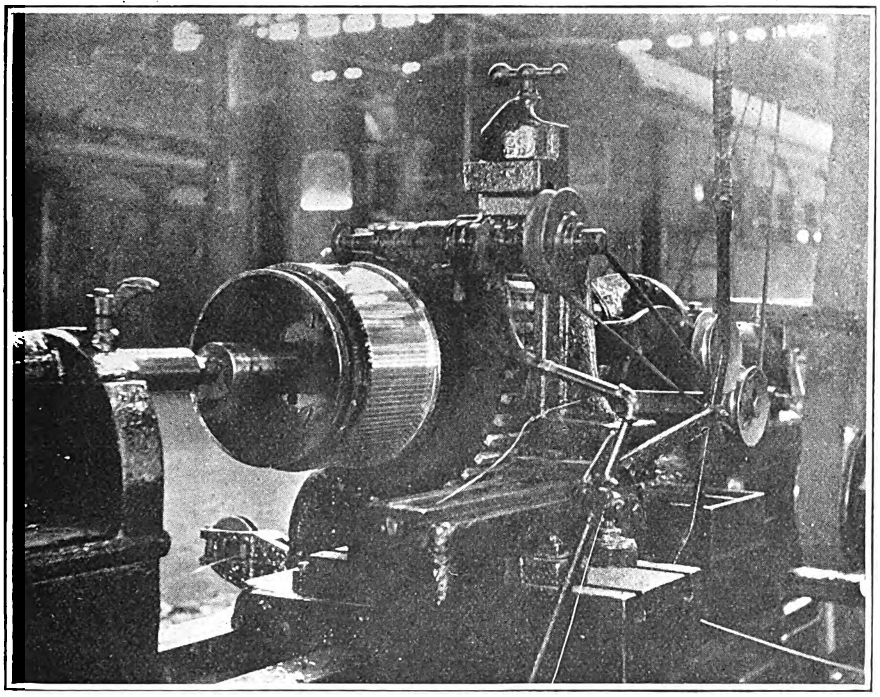
Type of Motor	Number of Motors	Circuit Breaker Setting	Full Load Current	Per Cent of Full Load Current
GE—57	4	550 Amp.	92 Amp.	150
GE—67	4	425 Amp.	72 Amp.	147
GE—67	2	210 Amp.	72 Amp.	145
GE—70	4	425 Amp.	70 Amp.	150
GE—80	4	425 Amp.	71 Amp.	150
GE—202	4	425 Amp.	74 Amp.	145
GE—247	4	315 Amp.	52 Amp.	151
GE—258	2	150 Amp.	37 Amp.	200
WH—306	4	550 Amp.	88 Amp.	155
WH—508	2	150 Amp.	37 Amp.	200

The Divisions will not attempt to change these settings. Any breakers that are found improperly set will be returned to the Shops.

This General Order Shows Correct Setting of Circuit Breakers on Each Type of Car Equipment Used in Kansas City

Commutator Slotter on Banding Lathe

IN THE Decatur shops of the Illinois Traction System a home-made commutator slotting attachment has been rigged up on a modified engine lathe. The attachment consists of a vertical standard mounted on the former tool post guide at the rear of the lathe bed. This upright slides longitudinally parallel to the axis of the lathe and carries at its upper end the milling spindle, which can be raised or lowered by means of a hand screw on top of the upright. The spindle carries a small milling cutter at one end and a 5-in. grooved pulley at the other. Two idler pulleys mounted beneath and to one side guide the raw-hide driving belt which takes power from the overhead line shaft. This arrangement permits the apparatus to be moved back and forth. Compressed air from the shop supply is used to blow



Home-Made Commutator Slotter Also Serves as a Banding Machine in the Decatur Shops of the Illinois Traction System

the particles of mica and copper away from the cutter, being fed through a rubber hose, with a regulating valve for the operator.

In operation, the milling cutter is lined up with the axis of the armature, which is then revolved until the mica is in line with the cutter. After moving the vertical screw adjustment to get the necessary depth of slot, the cut is made by sliding the tool back and forth on the ways of the tool post guide.

The entire outfit was made in the shops from materials at hand. The three pulleys are brass trolley wheels and the upright with screw adjustment is a portion of an old lathe, while the spindle shaft and housing were made up in the machine shop.

This lathe is also used when banding armatures, so that preparation of the rewound armature for service is all done on one machine.

Wheel Grinding Practice in Twin Cities

FOR a number of years the Twin City Rapid Transit Company's mechanical department has been grinding the treads of rolled-steel wheels, using a Norton grinder for the purpose.

This practice is followed in all cases where wheels require attention, except when a thin flange develops to a point where the wheel must be turned. In this event the entire tread, as well as the flange, is turned.

One interesting feature in connection with this grinding is the practice of cutting a groove in the throat of the wheel where the flange joins the tread. This is done to prevent the corner of the grinding wheel from chipping when it comes in contact with the fillet at this point.

Speed in handling wheels to and from the machine is an important element in obtaining maximum output per day. In the Snelling Avenue shops an overhead electric hoist, traveling on a track at right-angles to the machine, has enabled one man to handle wheels and operate the machine. With these facilities, one man grinds an average of between 30 and 35 pairs of wheels per working day.

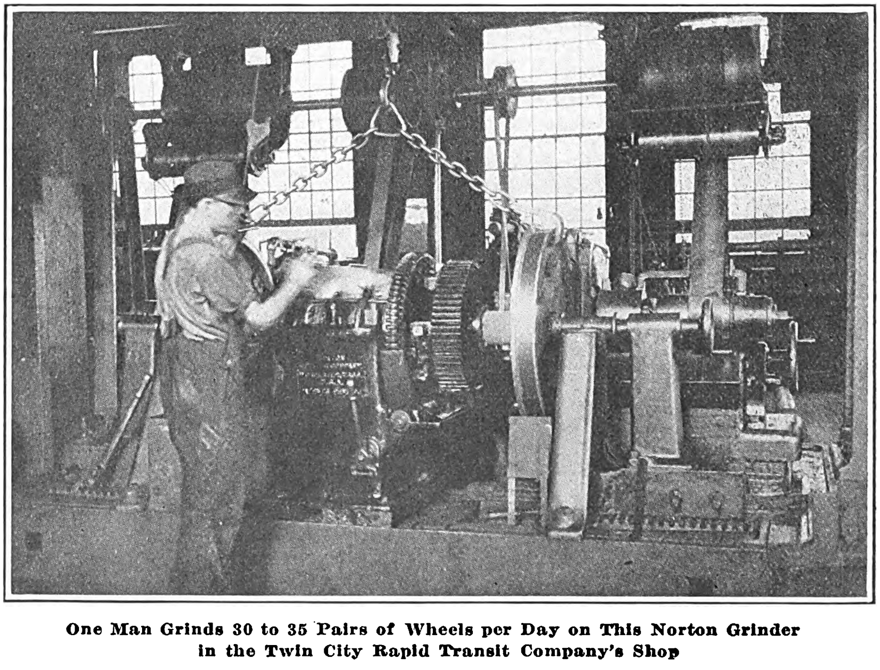
A liberal flow of plain water is used to cool the grinders. This is fed by means of a centrifugal pump delivering the water from a tank under the machine. After passing over the grinding wheels, the water drains back into the tanks and is recirculated.

Wood for Crossing Pavement

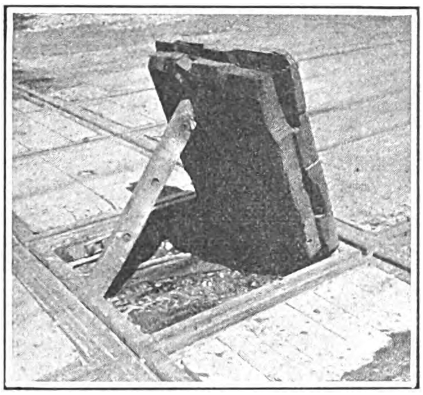
AT THE heaviest crossing in Fort Wayne, the double-track Calhoun Street line of of the Indiana Service Corporation crosses the three-track route of the Nickel Plate Railroad. As Calhoun Street is the main street of the town is was necessary for the street railway to provide a suitable pavement between the rails and between the tracks of its line. It was imperative that this pavement be of such construction that it could easily and quickly be removed and replaced when repairs to the crossing became necessary.

The type of pavement used is made up in sections which fit between the rails of the crossing. These sections are constructed of 3-in. planking laid in two layers, one layer being laid at right angles to the other, and the two are fastened together by means of ⅝-in. bolts with washers. The lower layer is roughly cut away to fit around the irregularities and bolt heads of the crossing. The top layer is nicely fitted to the head of the guard rail.

In the center of each section is



One Man Grinds 30 to 35 Pairs of Wheels per Day on This Norton Grinder in the Twin City Rapid Transit Company's Shop



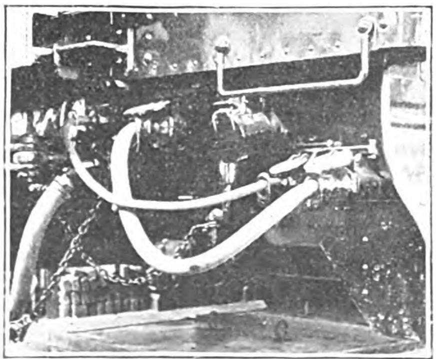
Section Raised, Showing How Lower Layer Is Hewn to Fit Bolt Heads, While Upper Layer Is Cut to Fit Head of Guard Rail

a 3-in. diameter iron ring securely fastened through the double thickness of planking with an eye-bolt. It is possible to remove the section a small derrick or by hand.

This type of crossing pavement is economical to construct and has met with the approval of the authorities of the city.

Permanent Jumpers Reduce Maintenance

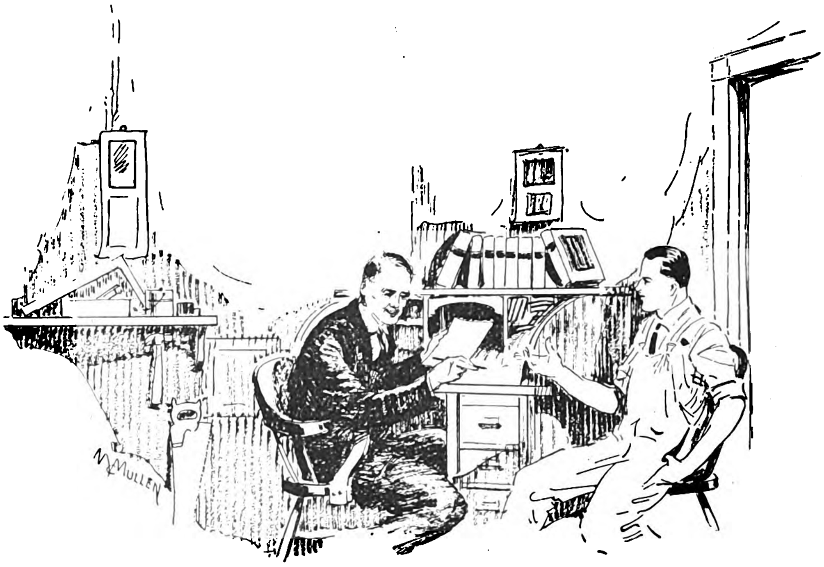
THE New York, Westchester & Boston Railway uses two jumpers between cars of each train. Both are for 32-volt circuits, a 12-point train-line jumper being used for the control equipment while a 5-point jumper is used for control of the electric brakes. The company is now fastening these jumpers permanently in position in one pair of receptacles and is providing dummy receptacles for holding the loose ends. The dummy receptacles consist of the standard casing without contacts and they are being mounted on the end step support as shown in the accompanying illustration. The maintenance forces report that troubles and the maintenance of the jumpers have been reduced more than 90 per cent since this change has been undertaken.



Permanent Jumpers Used on the Cars of the New York, Westchester & Boston Railway

Dick Prescott Discusses Plans

And Prepares for the Trip with Steve



TO DICK'S delight, Steve White, the carpenter shop foreman, was selected to accompany him on the trip of inspection to gather ideas before starting in on his new work of organizing an engineering department in the shops of the Consolidated Railway & Light Company. Steve himself brought this additional good news when he returned from the office of Thomas Mullaney, general foreman.

Thus these two men, although young in comparison with some of the other men in the shop, were selected to initiate the new program of improvements. In recognizing the ambition, vision and initiative of Dick and Steve, by this selection Mullaney proved himself a capable executive despite his many years of obstinate devotion at the shrine of precedent.

"Well, Dick," said Steve, after their first burst of rejoicing had subsided, and they found themselves seated in the little carpenter shop office discussing their plans for the trip, "we're going to have a pretty stiff job getting an engineering department under way, and most of it will be up to you. From what I gather, the old man wants me to kind of follow along and give you what advice I can from the practical standpoint, and I'll give you all the help I can—you know that.

"But, as you must appreciate, the real work of organizing this new department and getting it working in harmony with the rest of the shop will be your job. That's not going to be easy, for although the old man has made up his mind that something's got to be done, you'll have to sell him your ideas every step of the way and it'll require lots of patience and courage."

"I think you're right, Steve, and I'm certainly glad to have your experience and knowledge of the shop conditions to help me over the rough places. I want to start things slowly and to demonstrate by actual performance the service an engineering department can render. Once Mr. Mullaney and the foremen are convinced that we can save them a lot of lost motion and be a real help in getting out their work, it will be easy sledding. I intend to feel my way along at first and study conditions carefully, rather than try to make a big showing at the start."

"That's the idea, Dick, and you can depend on me to help you all I can. I see where you can help my department a lot and I know the same conditions apply in other departments. When we get back from this trip I'll try to tell the advantages of the new plan to the other foremen so as to get them interested in giving you their co-operation."

"I'll certainly appreciate your help very much. There are several things that we can get started on as soon as we return. For instance, it seems to me that the shop badly needs some way to standardize maintenance practice. Maybe we can issue a uniform kind of maintenance order giving the exact practice to be followed. Such items as limits of wear for bearings, oiling periods, procedure on inspection and many other details like that could be definitely covered by such orders. That would cut out the guesswork and ought to improve our methods. My idea would be to have these standards we propose freely discussed at foremen's meetings, so that each order would actually represent the combined opinions of the department staff rather than the idea of a single individual."

"Good dope, Dick, you're thinking along the right lines. That's an instance of some of the things we can get under way when we get back. Now we ought to start out and make up an itinerary for this trip. The old man says we can have three weeks, and we want to make the most of the time. Suppose we start in and make a list of the properties we want to visit and note some of the things we want to see in each shop."

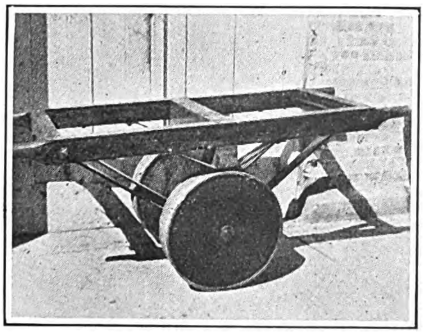
Sheet Metal Roll Smooths Armature Laminations

WHEN armature cores require rebuilding in the Snelling Avenue shops of the Twin City Rapid Transit Company, a sheet metal pressure roll, manufactured by the E. W. Bliss Company of New York, is used for reclaiming bent laminations.

This pressure-rolling machine is power driven and is found to be very effective in smoothing out the laminations. Previous to the installation of the above machine this work was done by hand. The machine method now cuts the total cost of armature rebuilding by 50 per cent in comparison with the former hand operation. In addition, the laminations are smoothed out in much better condition than was possible by hand methods, and it is found to be much easier to get them back in place on the shaft. The sheets stack up evenly so that pressing the core together after assembling is made less difficult, and a better armature is obtained.

New Type Heavy-Duty Dolly Truck

FOR transporting heavy materials, particularly steel sections such as girders, angles or plates, a heavy-duty truck has been built in the Wheaton shops of the Chicago, Aurora & Elgin Railroad. This truck is of wood frame construction, braced and reinforced by steel bars. The frame consists of two 2-in. x 4-in. members approximately 4½ ft. long joined near the ends and at the center by means of three cross-sills of the same cross-section, but only 18 in. long. Below the center cross-sill is a wood bolster made up of 3-in. oak of sufficient width to allow the wheels to have clearance over the side sills.



Heavy-Duty Truck Used for Transporting Steel from the Storage Yard to the Blacksmith Shop

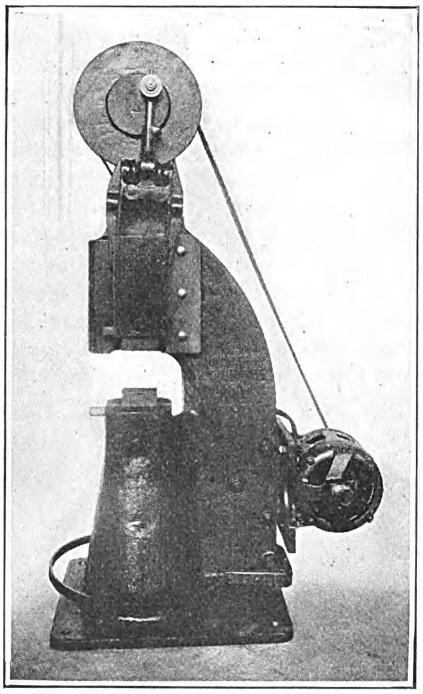
The wheels are of solid oak construction 2 in. thick and of 18-in. diameter with ¼-in. steel tires. The upper frame is braced to the axle on each side by means of two 1½-in. x ¼-in. steel bars. The framework is held together by means of long through bolts, and the upper surface is covered with 2-in. x ¼-in. steel. The side sills of the frame project beyond the end sills approximately 5 in. and are tapered and shaped in the form of handles. The axle consists of 1-in. steel shafting to which the wheels are held by means of washers and cotter keys on the outside end.

The truck is so well built that it is possible for one man to move ½ ton of steel over the concrete walk from the storage yard to the blacksmith shop. The entire truck was built in the blacksmith and carpenter shops, there being no machine work in conjunction with its construction.

New Equipment Available

Small-Sized Power Hammer for General Service

GENERAL service hammers designed particularly for shops where there is insufficient blacksmithing to warrant a large investment in a power hammer are being placed on the market by Beaudry Company, Inc., Everett, Mass. These hammers are built in three sizes with rams weighing respectively 25, 50 and 100 lb., and they may be operated by an overhead belt or can be equipped with individual motor drive.



Motor-Driven Hammer for General Service

The hammer is started, stopped and regulated through the treadle which throws a cone clutch in or out of the hammer pulley. The hammer head is of steel. Its travel is guided by external elliptical-shaped tracks. Two steel spring arms with steel rollers at the lower extremities and a helical spring at the top operate upon the curved track and lift and throw the ram, which with increased speed of hammer acquires increased travel and force of blow. Full strokes can be obtained on varying thicknesses of stock with no change of adjustment.

The ram operates in heavy V-shaped guides and has in addition an adjustable taper gib for taking up the wear. The hammers have long strokes and may be operated at high speed. Since the frame is self-contained and cast in one piece no extensive foundation is needed, and in some cases the hammers are bolted directly to the floor. These hammers may be worked to equal advantage from all sides, and as the anvil is offset long bars may be worked either way of the dies.

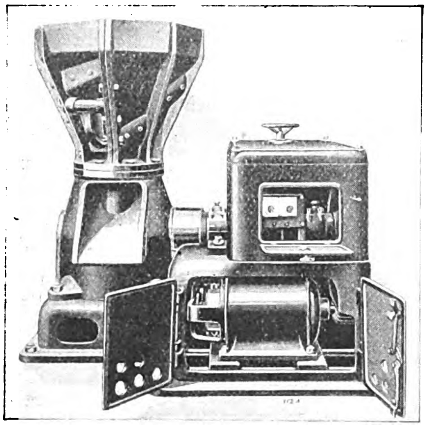
Connector for Temporary Work

A NEW line connector suitable for use where occasional disconnection is required and where particularly quick disconnecting is not necessary has been placed on the market by the General Electric Company, Schenectady, N. Y. It is recommended particularly for making temporary connections in construction work.

The clamp is of brass with the exception of the spring, which is of phosphor bronze, and the two set screws, which are of zinc-plated steel. A standard disconnecting switch hook is used to operate the device, which is so designed that the hook is held firmly to the connector while this is being attached or removed from a line. The connector has a current carrying capacity of 200 amp. and can be clamped to wires of diameters from $\frac{3}{16}$ in. to $\frac{5}{8}$ in. A $\frac{9}{16}$-in. hole is provided for soldering a lead to the connector.

Waste Metal Crusher

A NEW electrically driven machine, known as the American chip crusher, that reduces the volume of long, loose, bushy metal turnings has been placed upon the market by the American Crusher & Machinery Corporation of New York City. It is a low-speed machine for cutting, grinding and crushing metal turnings and similar scrap into coarse, granular pieces which can be handled with shovels, magnets, belts or conveyors.



This Crusher Reduces Metal Turnings to $\frac{1}{12}$ or Less in Bulk

The machine is simple, the only parts subject to wear, the cutters or knives, being removable and easily replaced. The metal turnings are forked into a hopper and the cutting action is accomplished by a number of spiral knives made of specially treated steel.

A Westinghouse 4-hp. motor drives the unit. The control apparatus is all built in. To prevent the accidental entrance of solid metal pieces too large to pass through the crusher, it is equipped with devices that protect it against the breakage of knives and the strains of overloading.

The economy of storage space, the saving in handling and shipping, and the increase in salvage value of waste metal turnings, made possible by this machine, have made it popular in machine shops and with waste metal dealers. The unit illustrated has a capacity of 5 tons of ordinary turnings per day.

Vertical-Horizontal Hydraulic Press

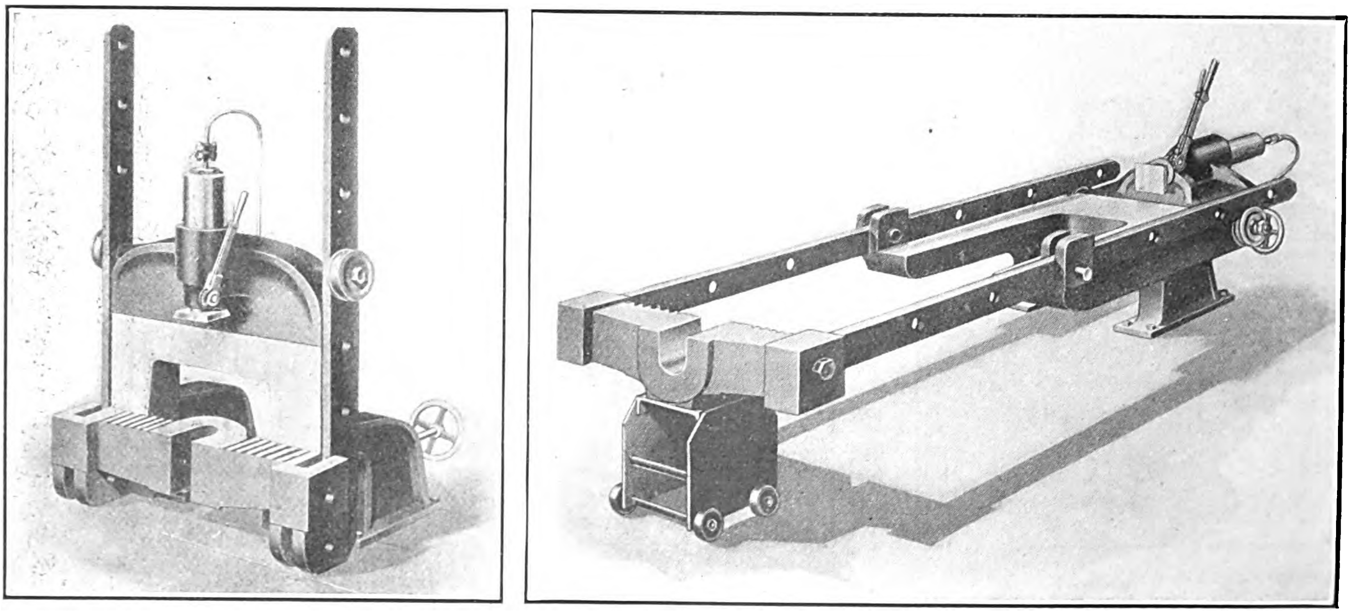
TO MEET a demand for a general utility shop press, the Watson-Stillman Company, New York, N. Y., has combined in one unit a vertical or a horizontal press for all operations which are ordinarily done in electric railway shops.

The machine may be converted from the vertical to the horizontal press by rotating the yoke by means of a hand wheel as shown in the illustration. The press is so balanced that the change from vertical to horizontal position may be made without the assistance of cranes or jacks. In the horizontal position it may be used for a variety of purposes, such as bending structural shapes, bars, pipes, etc., for forcing fittings, pressing gears on and off, forcing bearings into and out of housings, and like work. The bed of the press is planed smooth and the forcing tool on the end of the ram is supported on this bed.

For forcing long shafts, the abutment beam may be moved out a maximum of 7 ft. A four-wheel truck is provided to permit easy handling and also to support the beam when in the extended position. Hydraulic pressure is used only for the high pressure stroke of the ram. The idle portion of the forward stroke and the return movement is effected by a pinion which meshes with a rack in the ram. This rack and pinion device is of sufficient power to permit the use of this press for light arbor work without hydraulic power. The press is usually furnished with a hand pump, complete with hydraulic gage, pipe and connections. It may also be operated by a small two-plunger power pump. The press has a capacity of 60 tons and weighs 3,700 lb.

Apex CO_2 Recorder

AN ENTIRELY new and inexpensive CO_2 recorder known as the "Apex" has been introduced by the Uehling Instrument Company, Paterson, N. J. Inasmuch as the price of the new recorder is less than half that of other CO_2 machines, including the standard Uehling, it is believed that the new instrument will open up an entirely new field among the smaller plants, as it is stated that the anticipated fuel savings will warrant its adoption for boilers of 50 hp.



At Left, Press in Vertical Position. At Right, Same Press in Extended Horizontal Position or over. The pyro-porus filter and the standard Uehling gas drier and desulphurizer are used, insuring cleanliness of the gas line and interior parts of the instrument. There are no chemical solutions and no moving parts excepting the pen mechanism. As a result the manufacturer claims that the recorder will operate accurately without any attention or adjustment other than the changing of charts and renewals of dry absorbent, which should not exceed 10 minutes weekly.

This new type of recording instrument will be exhibited for the first time, in both recording and indicating types, at the Power Show which will be held at the Grand Central Palace in New York during the first week in December.

Automatic Circuit Breaker Can Operate Manually

THE Automatic Reclosing Circuit Breaker Company, Columbus, Ohio, has recently developed a circuit breaker which normally is full-automatic in its operation, but it may at any time be operated in the same manner as a manually operated circuit breaker by depressing the operating handle.

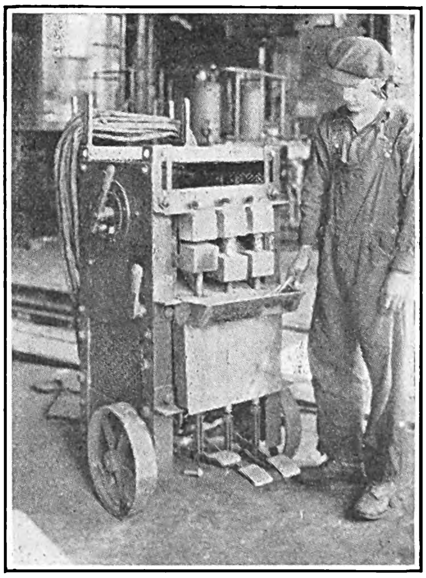
When operating as an automatic reclosing circuit breaker it is under the control of a double pole push-button switch. When this switch is in the "off" position all of the control circuits of the breaker are completely disconnected and the breaker remains open. When the switch is in the "on" position the control circuits of the breaker are connected and the breaker closes, provided conditions on the line are proper for it to close. On overload, it opens automatically, remains open a short time interval, regardless of load conditions, and at the expiration of that time interval recloses, providing the overload or short circuit which caused it to open has been removed.

When for any reason whatever it is desired to operate the circuit breaker manually, the control switch is thrown in the "off" position and the operating handle attached to the breaker. The breaker is then closed in the usual manner by depressing the operating handle. It will open on overload or voltage failure if provided with no-voltage release. The operating handle is removed when the breaker is again placed in automatic operation. Breakers of this type are available in capacities up to and including 2,000 amp.

Improved Rivet Heater

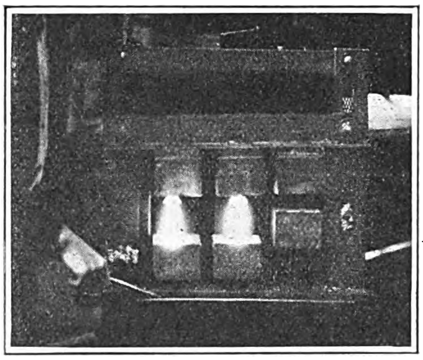
SEVERAL improvements have been made in the electric rivet machines manufactured by the Humil Corporation, New York City. The accompanying illustration shows one of the latest types as used at the Harmon shops of the New York Central Railroad. Rivets are heated by their resistance to electric current, so the heat is generated in the rivets themselves. The machine is of rugged construction and is built entirely of metal, asbestos and mica, so as to be fireproof. All coils are impregnated with high grade insulating varnish, to make them waterproof.

Particular attention has been given to provide safety for the operator. All live primary parts are shielded and the voltage at the heads of rivets is so low that it can hardly be felt, this voltage never exceeding 3 volts. Transformers are furnished for any primary voltage available, such as the a.c. lighting circuit. Recent improvements include a redesigned control mechanism which is of the interlocking type. This is so arranged that the main stop and start switch, which is shown in the lower left of the illustration, locks the controller against movement when load is on the machine. This prevents all arcing and burning of control contacts. The stop and start switch is also locked out until the controller brush is in the proper contact position. The control contacts are made of heavy plate copper, the movable one being of the laminated brush type. The current applied to the rivets is regulated by a five-speed controller which gives five different current values and so enables the operator to govern his production rate accurately. Rivets are removed and inserted by pressing the pedal for the contacts desired.



Improved Rivet Heater in the Shops of the New York Central Railroad

All of the coils are located around a separate center core. The secondary coils of heavy cast copper inclose the core completely except for a small gap at the top to provide the open circuit necessary. This design provides for the complete cutting of all magnetic lines by both primary and secondary coils. The primary coils are wound with bare strip copper insulated with asbestos and mica tape. This provides rapid dissipation of the heat to the vertical air spaces and at the same time eliminates high voltage between layers of windings.



Rivets Are Heated Uniformly in the Electric Machine

The small illustration shows the heat developed in rivets and that the rivets are heated evenly all over. This insures faster, tighter and cleaner riveting with less chance of loose rivets.

High Strength Cable

A NEW type of messenger or feeder cable for use in connection with railway electrification has been developed by the Bridgeport Brass Company, Bridgeport, Conn. It is intended for use in sustaining the contact wire through which current is carried to the electric rolling stock and at the same time to transmit the current from the power house. For this purpose it is necessary that the cable possess high electrical conductivity, great tensile strength, and non-corrodibility.

The cable is composed of an inner core consisting of seven strands of Phono-Hi-Strength wire, 0.11 in. diameter, and having a tensile strength of 130,000 lb. per square inch. This inner core is surrounded by 12 strands of hard-drawn copper, each 0.11 in. diameter.

Association News & Discussions

Regulators Must Avoid Competition*

Essential Railways Must Be Protected from Inroads of a Competitor Not Capable of Replacing Them by Regulation that Will Develop the Bus Along Sound Lines to Its Own Best Interest and to the Public's

By J. N. Shannahan
President American Electric Railway Association

I HAVE journeyed the 2,000 miles that separate Phoenix from my home upon Chesapeake Bay, in Virginia, because I believe it is of paramount importance that whatever can be done should be done to make clear the story of the electric railway to you gentlemen, who in your official capacity have so great an influence upon the fortunes of our industry.

It is no decadent, no obsolete, no dying industry. On the contrary, its preservation and its progression are as vital to the interests of the people of the United States as they have ever been, and there is as I see it no sign anywhere that the service performed by it will grow less essential in the years to come.

In 1922 the United States Bureau of the Census reports more than 15,300,000,000 passengers were carried on the electric railways of this country. This represents a gain in 5 years of more than 825,000,000 passengers, or nearly 165,000,000 a year. And it must be remembered that these 5 years saw the restriction of imigration, the migration of millions of our young men to the battlefields of France, the manufacture in this country of more than 8,000,000 automobiles and the intensive development of the motor bus as a common carrier.

Certainly, if statistics are needed to demonstrate the essentiality of electric railway service, this record of increased traffic, under conditions admittedly unfavorable to traffic growth, offer convincing proof that the electric railway industry is advancing and not falling back.

I make to you, therefore, no plea for the mollycoddling of a passing system of local transportation, the usefulness of which is gone, and the dying agonies of which you are asked to alleviate. On the contrary, I seek your co-operation in continuing, under conditions fair alike to the public which uses it and to the companies which furnish it, a service essential to the welfare of every community of any size in this country.

Service of the Bus Should Be Co-ordinated with Present Systems

Recently a new factor has appeared in the transportation problem. Without going into detail as to the merits of the motor vehicle as against the street car, it must be admitted that it has its place and its function. Certain territory in many localities can be best served by it. It is a flexible means of transportation. Many people like it. During the next few years thousands of motor vehicle routes will be laid out and franchises applied for. Instead of a deadly competition, should there not be a co-ordination of the present agency, the street car, and the motor vehicle? Instead of a situation where the street railway lines and the motor vehicle lines are straining every muscle to drive each other out of the field, why should they not blend together in order to perfect a transportation system to meet every need of the community which they desire to serve? In order that this co-ordination, this blending, this union, may be brought about several things are necessary:

First—There must be legislation which will set the motor vehicle in its proper place, on its own account and in relation to other means of transportation, as a common carrier, and on a footing with street car transportation in so far as franchises, penalties and restrictions are concerned.

Second — There must be legislation which gives the preference to the agency already serving the community to make needed extensions, whether they take the form of street railway or motor vehicle extensions.

Third—The regulation of such motor vehicle lines, whether urban, suburban or interurban, should be under the supervision of the public utility commissions of the various states, and certificates of convenience and necessity should in all cases be required.

Fourth—Where such extensions are necessary, and are demanded or requested, it should be within the power of the commission to designate what form these extensions should take.

Fifth—This legislation should be uniform, if possible, in all the states, particularly on account of the rapidly growing interstate business.

The electric railway managements of the country realize fully, I think, the advantages and the possibilities of the motor bus. According to the last available figures, 155 companies in the United States are operating 2,000 of them, and the number of companies and the number of buses are growing constantly. From the experience gained as operators, as well as from careful study and investigation, has come a conclusion, which is also borne out by the experience in Great Britain and other European countries where buses have been used in connection with electric railways for a much longer period than upon this side of the ocean. That conclusion is this:

In the handling of mass transportation, i.e., the carriage of great numbers of people within short periods of time; concretely, the carriage in our industrial centers of more than 40 per cent of all traffic in 2 hours of the early morning and 2 hours of the late afternoon, the electric car is the most efficient and most economical vehicle that can be used.

I think that this is an understatement of the situation, and that as applied to our larger communities it may with truth be said, that laying aside efficiency and economy, the electric car is the only vehicle that can perform the task at all. I reach this conclusion because the streets of few, if any, cities have sufficient area to accommodate the immense fleet of buses that would be required.

In cities that have subway or elevated systems for the operation of trains the field of the motor bus widens. It is conceivable that if such systems be extensive enough, the surface street railways may within a reasonable radius of such lines be superseded by buses, providing always that the operation of the two facilities be properly co-ordinated. But outside of New York, Boston, Chicago and Philadelphia there are no such subway or elevated systems, and so, to borrow the expression used in a famous opinion of the Public Service Commission of the Second District of New York, the street railway is the "backbone of any transportation system" in practically all of our large cities.

Competition Cannot Be Tolerated

The motor bus is, however, an efficient auxiliary to the electric railway and within its field should be given every possible encouragement. But I need not tell you gentlemen, who are the agents to whom the task of carrying out the great policy of regulated monopoly among public utilities, that competition between the electric railways and motor buses is as destructive of public welfare as is competition between telephone utilities, gas utilities or electric utilities; or that to injure, through competition, the ability of a common carrier to perform service is to work a wrong to the people who receive that service.

Competition upon any fair or equitable basis between electric railways and motor buses is impossible. The motor bus owes its existence as a carrier to a public subsidy, in the shape of a right-of-way, built and paid for by the taxpayers generally, and not included in the cost of service upon which its rates are based. Without good pavements motor bus operation would be impossible. Charge to the motor bus its share of the construction and maintenance of pavement and motor bus fares would be prohibitive.

---

*Abstract of address before National Association of Railway and Utilities Commissioners at Phoenix, Ariz., Nov. 14, 1924.

I do not argue for the imposition of additional burdens of taxation upon the bus. I do not quarrel with the policy of providing proper highways out of public funds for use by common carriers. I do, however, submit that it is the part of folly to destroy or cripple an existing necessary transit agency which pays a large portion of its income into the public treasury, by encouraging the competition of a publicly subsidized carrier, which, if it should be finally successful in eliminating its competitor, would itself surely fail under the burden of furnishing complete service.

It is but a short time ago that the proposition to put the motor vehicle under the control and regulation of the public service commission seemed rather startling. Yet slowly, but none the less surely, the idea has gained ground that the principal thing to seek and find is the public good. A system which permits a reliable medium of service to be harassed and annoyed by multitudes of parasites constantly nibbling at its patronage and its sources of revenue can hardly be said to be conducive to the public good.

Experience warrants the statement that in the average community the transportation service should be permitted by authority to take the form of a properly regulated monopoly. In many activities competition is the life of trade, but it requires no particular discernment to set it down as a fact that in the urban, suburban and interurban transportation business competition is fatal to prosperity and efficient service.

RAILWAY SHOULD BE GIVEN FIRST OPPORTUNITY TO SUPPLY BUS SERVICE

In the average community the transportation system is very often the result of a consolidation of several lines, perhaps built at various times. The corporation owning these lines has expended large sums in bringing them to a state of efficiency; its stock has been distributed among the people of the community, and if the corporation has been properly managed a good will has been built up in the community which is worth much to the utility in its dealings with the public. It may be that for many years it has handled the transportation situation in its locality with satisfaction to its public. Such a corporation should have the first demand upon the consideration of the people of that community whenever new lines of transportation are needed, and such a community, where the existing agencies have given satisfaction, should extend first to such agencies the preference in new territory and in new franchises.

Commission regulation as a substitute for competition has worked well in the case of railroads, of electric utilities, gas utilities and, where it is still effective, in the case of local transportation utilities. I know of no movement anywhere toward a return to the old system, whereby franchises could be indiscriminately secured without sanction of a central regulatory body, only to be sold, with or without physical property to the existing utility, to increase capitalization and bring a consequent effect upon rates. But the advent of the motor bus as a common carrier has injected an element of competition into the local transportation problem, that is being controlled and regulated all too slowly for the good of the public and of the utilities. Railway men, as well as public officers, have been slow to grasp the real meaning of the movement, and have been belated in recognizing that the situation at the root of it requires the same treatment that has been successfully applied in the regulation of other classes of public utilities.

The situation is clearing up. The studies made by this organization and the principles set forth in the decisions of many of the commissions here represented are having their effect upon the public mind. We are, I hope and trust, returning to the sane and sound policy of regulation that has been successfully applied in the past, and by so doing we are going to preserve the useful service of the electric railway, and add to it the equally useful service of the motor bus.

The propositions that I have set forth in connection with motor bus operation contain nothing that is not generally applied by your commissions in connection with the regulation of other utilities; they confer no special privilege upon electric railways; nor do they impose upon motor buses any regulation that is not now imposed upon electric railways in their relations to each other. They encourage the extension of motor bus service, they conserve electric railway service and they provide a means of bringing together both services, so as to organize a complete car and bus service to meet public requirements.

In considering the motor bus problem we are not confined to city lines, or even to state lines. Interstate bus lines have become a reality, and a stern reality, to state agencies which attempt to deal with them. As long as a traffic system remains within the boundaries of a single state, it is a state problem and may be handled and dealt with as such. However, when a state line is crossed it becomes more serious and more unmanageable. State commissions can no longer lay down rules, and unless the Interstate Commerce Commission has power to deal with the situation, where does such power lie? If it does not have it, should it not possess it? It seems to me that just as the commissions in the various states must see to it that proper state legislation is enacted, so equally important and necessary is it that these agencies should inaugurate the movement to give adequate authority to the proper body to deal with a situation that may soon become serious.

I but voice the general sentiment of electric railway managements when I say that we look to the state regulatory commissions represented in this association for such public spirited and intelligent action as will solve correctly and expeditiously the problems that the competition of the motor bus has brought about. We feel sure that you recognize, as we recognize, the essentiality of electric railway service, the advantages of motor bus service, the destructive effect of competition between the two and the beneficial effect of co-ordination under proper regulation by commissions having state-wide jurisdiction.

Such legislation can find its way to the statute books more easily through the efforts, the initiative, the recommendation and the active support of the commissions themselves than in any other way. It will not be denied that the real function of a public utility commission is to see that the public receives satisfactory service and the utility a satisfactory return on its investment. In order to accomplish this there must be no duplication of service. Each territory should be served by the agency best adapted to its needs, whether it be street railway or motor vehicle, and these results can be best brought about by the preference suggested above in giving the utility which is prepared to render the proper service the first opportunity to serve.

The present attitude of the average public service commission toward the development and regulation of the various utilities has been the result of a growth. The whole body of the law has changed within a decade. The attitude of the public has changed. The idea of the man in the street that commissions were created solely to protect the people against the greed of corporations has been reformed, and if such man is keeping up with the times and has caught the modern spirit of fairness and service, he believes that the commission has other duties of a different nature altogether, viz.:

(a) Seeing that both the public and the utility get a square deal in matters of rates and regulations.

(b) Giving the public service, but insisting that it pay what such service is worth.

(c) Removing the utilities as far as possible from the uncertain and unsavory field of municipal politics, and placing them where the rule of reason and common sense regulates them rather than the whim of ward politicians and small-town regulators.

For the association of which I am president, I offer you full co-operation and assure you that its members realize the difficulties in your path and the splendid service that you render to the public, first, and the utilities, second.

Self-Ventilated Motors in Central Europe*

By E. Nier
Manager of the Municipal Street Railways of Dresden, Germany

The lighter street car service of earlier years kept back the wide adoption of self-ventilated motors, although Dresden, for instance, had 26 such motors in use as early as 1914. In these more strenuous days, every means of economizing power and cutting down upkeep must be exploited, so that there has been good reason to make greater use of the self-ventilated motor.

Out of 22 of the larger properties from which replies to a questionnaire were received, 10 reported no such motors at all. The remaining 12 did practically nothing in the war years, but in the year 1921 Berlin added 194 to a preceding 6 and now has 270; Dresden added 90 to the original 26 and now has 178; Hamburg began with 2 in 1922 and now has 108. Amsterdam has only 10, The Hague 74 and Vienna 72. The total number reported early in 1924 on the twelve properties was 860.

The fears that self-ventilated motors would suffer from the entrance of foreign substances, thus increasing their shopping time and upkeep, have not materialized in practice. Frequent sprinkling of the trackway is one method of minimizing the entrance of dust and other particles. Screens and filters cannot keep out dust entirely, but it is gratifying that the material picked up has not proved very harmful.

The Hagen Street Railway operated over such a dusty roadway that it arranged to take the air from the car interior through hose of 60 mm. (2.4 in.) to 100 mm. (4 in.) diameter. This hose did not last long because of the constricted space between car body and truck. Hence 54 motors were closed to operate in the ordinary way, but 32 were still run as self-ventilated motors. Vienna has also tried to use air from within the car. The Merseburg interurban railway has taken air from the roof through a pipe run through the partition between the second and third-class compartments.

A typical case of dust collection showed much dust blown out of a perfectly sound self-ventilated motor which had come into the shops after a run of 35,000 km. (21,700 miles) because of damage to some other part of the car. The motor itself apparently could have run for 50,000 km. (31,000 miles), to 60,000 km. (37,200 miles) without difficulty.

Examination of a self-ventilated motor before cleansing discloses that the deposits of foreign matter are not uniform. The commutators are usually very clean because their rotation throws off loose material. Not much more than a film of dust will be found on the upper parts of the armatures, the field coils, poles and brush-holders. Dust containing iron will be found drawn to the pole pieces without, however, causing damage. The bottom of the motor housing will contain more dust, some of it loose and the rest in the form of balls or other shapes up to the size of a small nut. These nuggets have a scaly structure and often have spiky projections. The various shapes are probably due to the mixture of the dust with oil or water and to the tumbling effect caused by the vibration of the car.

The value of internal cooling of the armature is considered questionable, especially, as the required ventilation channels weaken the armature both mechanically and electrically. Instead, the amount of air passing over the surface of armature and field coils can be increased.

The air inlets should not be so low as to suck up rain, sprinkling or puddle water from the trackway. Powdered or granulated snow, because of its entrance in quantity, may find some weak spot in the insulation, but ordinary snowflakes, rain or mist are usually vaporized before they can do any harm. The existing screens and filters cannot be considered as air purifiers but rather as catch-alls for large obstructions.

It is generally best to take air from inside the car, but as two motors require 10 to 15 cu.m. per minute, special means would be required to avoid uncomfortable drafts for the passengers. For motor-cooling, it would not be desirable in winter to draw warm air from the interior. Dresden is experimenting in the other direction by sending warm air from the motors into the car.

The companies replying stated that they overhauled these motors at their customary car-overhaul periods, which varied from 27,000 km. (16,740 miles) to 60,000 km. (37,200 miles). The only item stated by some as tending toward more upkeep was a slightly greater wear of the brushes. The best method for cleansing the motors was said to be that of blowing them out with compressed air at the time of regular overhaul. Intermediate cleansings were mostly unnecessary.

While the self-ventilated motor is not yet all it should be, it is, in the writer's opinion, the type most likely to be the street railway motor of the future.

---

Track Standards in Central Europe*

By Paul Goetz
Manager Leipzig Street Railway, Leipzig, Germany

Although the replies to a questionnaire on track standards prepared by the writer were more than a year and a half old (owing to postponement of the 1923 convention) and often incomplete, it has been possible to present some interesting facts, which are summarized as follows:

Track Gage — The prevalent gage, particularly in the larger cities, is 1.435 m. (4 ft. 8½ in.) as shown by the fact that of the 5,857 km. (3,631 miles) of route operated by 42 replying managements in Germany only 1,689 km. (1,047 miles) was of narrower gage, usually 1 m. (39.4 in.). In Austria, the ratio in favor of standard gage was almost 10:1, four users operating 653 km. (405 miles) of standard gage against three undertakings with 64 km. (39 miles) of narrow gage.

In Czechoslovakia, only one operator with 15 km. (9 miles) had standard gage, the other five totaling 78 km. (48 miles) were of narrow gage. The one Danish property replying had 168 km. (104 miles) standard gage. The six Swedish properties totaled 273 km. (169 miles) standard gage. Three Norwegian systems totaled 37.7 km. (24 miles) standard, while one property had 11 km. (7 miles) meter gage. On the three Dutch lines totaling 298 km. (185 miles) only 2 km. (1.24 miles) are narrow gage. In Switzerland, however, nine roads totaled 184 km. (114 miles) meter gage, as the only standard gage route reporting was the cross-country Thurgaubahn with 43 km. (27 miles).

Rail Sections—The reports on rail sections gave 4,845 km. (3,004 miles) of route in grooved rail and 1,010 km. (626 miles) in T-rail, but this shows but a small part of the picture. The standard practice in all the countries included is to use grooved rails in paved construction. In Berlin and other cities new streets are parkwayed in order to permit open track, T-rail construction.

Light rail is going out, the former minimum weights of 20 to 25 kg. per meter (40 to 50 lb. per yard) being replaced by rails weighing 30 to 35 kg. per meter (60 to 70 lb. per yard) and more.

The unnecessarily large variety of rail sections is deplored. During the war the properties naturally were glad to get anything they could. They have, however, since failed to take advantage of the post-war possibilities in making use of adopted standards and consequently saving money. The non-German properties show a better realization of the advantages of standard rail sections.

A noticeable tendency is the preference for rails as high as 180 mm. (7 in.) as the most practicable for block paving as well as for asphalt and wood paving on concrete base. It is poor economy to use a lighter section on routes with sparse traffic, inasmuch as the weight of the rail should be determined more by the weight of the car and the depth of the paving.

Provided the rails are welded and on good foundations, there seems no good reason for going to sections of 200 to 210 mm. (say 8 in.) height. Short lengths of 200-mm. rail have been laid at Dusseldorf, Hamburg and Kiel; and of 210-mm. rail at Munich. The last construction, although using steel ties and concrete foundation, does not show better resistance to wear than track in other large cities. Berlin still has 160-mm. (6.4-in.) rail on 90 per cent of its routes, but since the beginning of 1923 it has been installing 180-mm. (7.2-in.) rail.

Another tendency is toward the use

---

*Abstract of a paper before the Internationaler Strassenbahn und Kleinbahn Verein, Homburg von der Höhe, September, 1924.

of shallower and narrower grooves, which is helpful in securing more practicable special work. This is true on both German and non-German properties.

Welded Joints—In welding new rail the most common practice is to use thermit. Electric welding is preferred for old rail, although the same success would be obtainable on new rail. Electric welding is the only practicable method for "dutchmen" or similar heavy repairs. A pre-requisite for the success of welding is well-schooled labor. Welding is most common in Germany, Denmark, Switzerland and Norway. Hitherto the latter two countries have used thermit only, but the Swiss will use electric welding in the near future.

Special mechanical constructions have not found general acceptance, although the Melaun and Hesse joints respectively are in proponderant use at Berlin and Vienna. A summary of mechanical and welded joint practice shows that on the German properties 62 per cent of the joints were mechanical and 19.4 thermit, the rest being electric weld or special. Austria has 51.3 per cent mechanical and 2.8 per cent thermit, the rest being special. On the Czech properties the proportions were 87.8 per cent mechanical and 12.2 per cent electrical.

The following countries have been using thermit on all new work since 1912, so that their present ratio of thermit alone now stands: Sweden, 14.1 per cent; Norway, 43.85 per cent; Holland, 7.1 per cent; Switzerland, 40.1 per cent. All the rest is mechanical except 1.31 per cent electric welding in Sweden and 0.39 per cent in Holland.

Special Work—The standardization of special work has made great progress, the standard curvature for switches is on a radius of 50 m. (162 ft. 6 in.). In Germany, 74.4 per cent (43) of the reporting operators used the standards in varying degrees; in Austria, 87.5 per cent; in Czechoslovakia, Sweden and Holland, 66.6 per cent; in Switzerland, 80 per cent and in Norway 100 per cent.

Curved track usually ranges from 10 to 20 per cent of the total route length, except in the older cities which have many narrow and twisting streets. Heidelberg leads with 50 per cent, but even so large a city as Hamburg attains 30 per cent of curves. Munich has curves of as little radius as 13 m. (42 ft. 8 in.). The effect of curvature on life is not ascertainable because of the wide difference in conditions. Much of the trouble due to excessive curvature is said to have resulted from blindly following the original horse-traction layouts. The author believes that conditions can be alleviated if effort is made to secure the narrowing of sidewalks, the cutting off of corners, the right to lay tracks other than absolutely parallel to the curb, etc.

Retention of Block Paving in Rail Strip—There is a tendency toward monolithic paving, but there seems no reason why it should be necessary to use such paving between and alongside the rails. The asserted advantages of monolithic asphalt and wood block paving do not compensate for the greater difficulty of keeping the track structure well drained and free from upheavals due to freezing. In the first instance the demand for a concrete substructure means that the line is out of service for quite a period during the setting; and in the last instance, the upheaved substructure leads to excessive maintenance and a solid substructure transmits vibrations to adjacent houses. The elastic type of substructure, using well-drained broken stone and block paving, is to be preferred.

This discussion does not apply to all of the reporting countries, but rather to Germany, Austria, Switzerland, Denmark and to Zagreb, Jugoslavia. Norway, Sweden and Holland use block paving chiefly, while some Swiss cities have macadam. It is observed that quite a number of railways use but one layer of concrete into which the rails are bedded directly. It would be cheaper in construction, and also easier to replace rails, if they were set on a layer of concrete only 2 to 3 cm. (0.8 to 1.2 in.) thick in combination with an asphalt mixture around which a second layer of concrete would be poured. The use of cement to solidify the substructure is considered an unnecessary expense because careful work will produce uniform density with broken stone substructure and block paving.

The experience of a majority of operators is against the use of rigid track with concrete base. On the other hand, the Vienna Municipal Street Railway has had 10 years successful experience with absolutely rigid track, partly because of the excellent drainage. Of course, such construction requires exceptional skill and is doubtless expensive. In the first Vienna construction, the rails were set in reinforced concrete. The substructure was of a good mixture, but a still richer mix was used for the second layer which was carried to a height of 10 cm. (3.9 in.) above the base of the rails. Then followed a sand cushion and asphalt base for paving block 20 cm. (7.8 in.) high. In a later construction, the concrete was reinforced directly around the rail base because the rails were of greater height than the paving block. It is questionable whether such track could be readily built on pre-existing concrete substructure. In any case it is not believed that any known concrete construction can guarantee the undisturbed position of the rails during the period of their useful life.

The cost of maintaining the substructure and paving in the track strips and of street cleaning therein is almost universally borne by the street railways. Only three properties, all in Germany, reported the use of compressed-air for breaking up concrete. One Danish operator has ordered such equipment and one Swiss operator contemplates a trial.

Central Association Annual Meeting

THE annual meeting of the Central Electric Railway Association will be held at the Miami Hotel, Dayton, Ohio, Jan. 8 and 9, 1925. The program is being prepared and will be published in a later issue.

European Progress with Magnetic Track Brakes*

By Jörgen F. S. Barth
Manager Christiania Railway,
Christiania, Norway

THERE was a time when cars were so small and light that all braking could be readily done by hand. As vehicles grew larger and heavier, improved hand brakes such as the Ackley and Peacock types were adopted. (Short-circuiting brakes were also added.—Eds.) Next came the magnetic track brake which was free from the handicap of a wheel brake on slippery rail.

The first magnetic brakes appeared some 20 years ago. They were fed directly from the line through a separate switch and were used chiefly for emergencies. Their stops were so abrupt that one might say the place of danger had been transferred from outside to inside the car. To overcome this defect, most magnetic brakes are now wired into the short-circuit braking contacts of the controller so that they go into action gradually. The last braking circuit contact is arranged to take line current direct in order to permit emergency stops.

To obtain definite information a questionnaire was mailed to 244 members, but as only 29 replied, it may be assumed that no more than the latter number are using magnetic track brakes. These operators have a total of 5,342 motor cars and 3,607 trailers of which 1,113 motor cars have magnetic brakes and 141 trailers are so equipped. Only three operators use magnetic track brakes on all of their motor cars. The range of braking effort is between one-half and three-fourths of the car weight.

These brakes always are operated independently of the wheels. The gap between shoe and rail ranges from 3 mm. (0.12 in.) to 20 mm. (0.8 in. Maintenance is trifling as it consists chiefly in replacing worn shoes. Zürich was the only undertaking which reported otherwise. One operator gave his rate of shoe wear as 1 mm. per 1,000 km. (620 miles). Nine operators were of the opinion that the magnetic track brake was less injurious to the motors than a short-circuiting wheel brake the others expressed no opinion. Only five operators observed any rail-tread wear ascribable to the use of the magnetic shoes. Some operators who also use air brakes, said that the latter were satisfactory but cost more to maintain than magnetic track brakes.

On the Christiania Railway three-car (one motor and two trailers) trains totaling 51 metric tons loaded are standard. The following advantages of magnetic track brakes have been found:

1. Powerful braking without disturbance to passengers.
2. Failures are very rare.
3. Skidding (locked wheels) is impossible.

---

*Abstract of a paper before the Internationaler Strassenbahn und Kleinbahn Verein, Homburg von der Höhe, September, 1924.

4. The chief maintenance is replacement of shoes; but the saving in wheel and wheel-brake shoe wear more than equals this upkeep.

5. Sand has been cut 50 per cent; and it is used only on up grades.

6. To assure this extra-powerful braking, the motorman need only move his regular brake handle somewhat faster.

7. The motorman enjoys the confidence of complete braking control.

8. Accidents are reduced and money saved thereby.

9. There is less strain on the motors.

10. Rail corrugation is perceptibly decreased.

Of course, these advantages are not obtained for nothing. The extra rail wear seems to amount to 1½ per cent of the track upkeep. There is also somewhat less braking current available for car heating compared with ordinary short-circuit braking, but it is hoped to improve this by some changes in connections. It may be added that the Christiania property is in a country requiring car heating some five months in the year. Fog, ice, snow and leaves also make the braking problem unusually arduous.

Correction of Headway Inequalities*

By Alexander Patz

Manager of the Budapest Street Railways, Budapest, Czechoslovakia

ONE of the important duties of the traffic director is to devise methods of keeping headway inequalities on combination routes within the lowest possible limits, aside from congestion or equipment defect causes. This subject requires the use of higher mathematics to show the relative positions of moving cars of different runs on a section common to all.

As an example, take Rakoczy Street which had been served by 12 routes having individual headways of 15, 12½, 12, 11, 11, 10, 10, 10, 9, 9, 8 and 8 minutes respectively. The combined service had cars bunched at some places and excessive spread at other places, giving an irregularity index of 74.5 per cent. By using 10 minutes as a base headway and dropping out cars here and there, the irregularity index was reduced to 34.7 per cent.

In rush hours, the service should be increased in even multiples by going to a 5-minute headway to double the service, to 3½ minutes triple the service, to 2½ minutes to quadruple the service, to 2 minutes to quintuple the service and so on. On the other hand, an even interval during hours of reduced service can be secured through dropping every eleventh car to attain an 11-minute headway, every sixth car to attain a 12-minute headway, every fourth car and fifth car alternately to attain a 13-minute headway, etc. A 10-minute base headway is recommended because it is also easier for the public to remember the local time points as being 1, 2, 3 or more minutes beyond 20, 30, 40 minutes, etc.

To minimize the piling up of cars through any cause whatever, delayed motormen are instructed to report immediately upon reaching a terminal whether trouble on other cars was responsible. These reports are treated as a check upon the report of the motorman whose car was at fault. A higher standard of care is necessary for those cars that are regularly run through congested districts. Pull-in records are divided according to the two chief types of cars inherited from the predecessor private and municipal properties.

A most helpful step toward minimizing breakdowns on the line is found in the practice of posting comparative delay records of the different carhouses every four weeks, the division of troubles showing whether the delay was due to defects in equipment or in operating methods. An efficiency bogey is set up for each type of equipment. Carhouses which exceed the average delays are termed "poor" and those which fall below the average are termed "good."

The operating points on which each depot is judged include the following: Deviation from schedule; man shortage and misses; collisions with own cars; collisions with other vehicles; damage to current collectors through taking switches improperly, etc.; accidents. The equipment defects are classified as follows: Motors; control and resistors; circuit breakers and fuses; current collectors; miscellaneous electrical equipment; wheels and axles; braking; bearings; draft rigging; fenders; miscellaneous mechanical equipment; car scarcity.

In consequence of this searching four-weekly comparison of personnel and maintenance standards, the original average of 16.5 minutes delay per car or train per diem has been lowered to 2.6 minutes.

---

*Abstract of a paper before the Internationaler Strassenbahn und Kleinbahn Verein, Homburg von der Höhe, September, 1924.

Midwest Association to Meet in St. Louis

ANNOUNCEMENTS have been sent out by Secretary J. A. Weimer, that the midyear meeting of the Midwest Electric Railway Association will be held in St. Louis, Mo., on Nov. 24 and 25.

Many questions of importance to the electric railway industry in general, and particularly to those properties in the territory covered by the association, will be discussed at this meeting. The detailed program of the two-day session will be announced later.

National Highway Traffic Association

THE annual meeting of the National Highway Traffic Association will be held in the new clubhouse of the Automobile Club of America, 12 East 53rd Street, New York City, on Tuesday, Dec. 2, 1924. Two sessions will be held, the first beginning at 2:30 and the second at 8 p.m. A dinner open to the public will be served at 6 p.m. in the Grill Room. Requests for dinner reservations should be sent to Elmer Thompson, secretary, Automobile Club of America.

The subjects to be considered include: "Solutions of the Parking Problem in Congested Districts of Municipalities"; "Enforcement of Traffic Regulations by Utilization of a Police Traffic Bureau"; "Methods of Increasing Traffic Capacity of Streets"; "State Fees for Commercial Motor Vehicles as Private and Common Carriers"; "Regulation of Pedestrian Traffic."

Engineers Will Discuss New York City Traffic Problem

A JOINT meeting of the New York section of the American Society of Civil Engineers and the Metropolitan section of the American Society of Mechanical Engineers will be held in the auditorium of the Engineering Societies Building, 33 West Thirty-ninth Street, New York City, on Wednesday evening, Nov. 19, at 8:15 p.m.

The traffic problem of the city will be the subject of the evening. Those who are on the program to speak are Mayor J. F. Hylan, Richard E. Enright, police commissioner; John Kenlon, chief of the New York City Fire Department; Major Elihu Church, transportation engineer Port of New York Authority, and C. W. Leavitt, consulting engineer.

Preceding the meeting the members of the sections will meet for dinner at the Building Trades Employers' Association, 34 West Thirty-third Street. Dinner will be served at 6.30, so that those attending can reach the Engineering Societies Building in time for the moving pictures which will precede the regular meeting.

American Association News

Metropolitan Section Has Enthusiastic Meeting

THE Metropolitan Community Section of the American Electric Railway Association met in New York on Nov. 7, with an attendance of more than 500. The principal speaker of the evening was E. F. Wickwire, vice-president Ohio Brass Company, whose subject was "Friendlyizing," and whose talk was enthusiastically received.

This was followed by motion picture films prepared by the New York Transit Commission, entitled "The Straphanger," and showing the crowded conditions of the subways and the problems confronting the companies in trying to solve the difficulties.

The membership committee reported a total enrollment of 569 members, but later it was announced that the membership committee's report was made up at 5 o'clock and that since then up to 8 o'clock the enrollment had increased to 650.

This is the second meeting of the Community Section and the enthusiasm seems to bear out the feeling of President Thompson that the membership will soon reach the 1,000 mark.

The News of the Industry

Commission Has Right Over Fares

Victory for Virginia Railway & Power Company in Decision of Commission Over-ruling City's Fare Plea

Objections of the city of Richmond to the fixing of rates and valuation of property of the Virginia Railway & Power Company by the State Corporation Commission have been overruled in an order entered by the commission. It was the unanimous opinion of the commission's members that that body has the right to value the power company's property and fix rates over the traction lines, despite franchise provisions.

The order over-rules the petition of the city to dismiss the recent request of the company for such a valuation in the Richmond division. It also over-rules the city's demurrer in the case.

The company has been ordered by the commission to proceed at once to submit facts and evidence bearing upon the value of its property for rate-making purposes and otherwise proceed in the case in accordance with its petition.

Of the importance of the case the commission said:

> The case is of great importance, and that it is not free from difficulty and doubt is manifest from the divergent views entertained by learned counsel on each side and the copious and able briefs filed, but we feel that, under the law, there is a plenary jurisdiction in the commission, and we feel confident that such a holding is conducive to the best interests of the State of Virginia and the people thereof generally.

Jurisdiction of the commission was challenged by the city of Richmond on four grounds, as follows:

> 1. That all of the four main franchises granted to the predecessor companies of the petitioner, and the extensions of these franchises, constitute inviolable contracts for the fixing of rates during the life of the franchises binding upon the State and protected by the federal and state constitutions.
> 2. That the General Assembly has vested the city with authority to prescribe such rates within the proviso of section 156 (b) of the Constitution.
> 3. That the matter is *res adjudicata* as between the city and the Richmond Passenger & Power Company, predecessor of the petitioner, and between the city and the Richmond Traction Company, predecessor of the petitioner.
> 4. That the company is precluded by estoppel or by waiver from litigating the question before Oct. 10, 1924.

The commission took up each of these contentions in turn and disposed of it. It said in effect that after very careful consideration of the constitutional and statutory provisions which seem to it to be pertinent and of the very able and comprehensive briefs filed by counsel, that it has jurisdiction to make proper investigation and to value the railway in Richmond as a whole, to determine whether or not the existing rates are just and reasonable, and if it finds them unjust and unreasonable, to fix rates which are just and reasonable.

In addition to disposing of the four contentions previously noted the commission set down the following general propositions:

> 1. The tendency of the decisions all over the country, including Virginia, has for some time been, and is, toward recognizing the police power of the States as to rates of public service corporations as largely inalienable.
> 2. A like tendency has recognized, and does recognize, the advisability in the interest of the public of a central, unified, uniform and general control as to rates.
> 3. As to rates of a city transportation company and rates of many other city public utilities, there is manifestly more definite interest in the people of the State generally in the former than the latter.
> 4. Every practical consideration, in view of the complicated situation in the city of Richmond, as well as considerations of convenience and public policy, lead to the conclusion that there should be a general and uniform control as to rates of transportation in the city of Richmond, and where reason clearly demands a certain course, the law, which is based on reason and exists for the general welfare and the best interests of all, will generally be found to follow. Certainly the law should be held to follow the dictates of reason and policy and the interests of all the people, unless it clearly is contrary to such dictates.

The petition of the company asking the commission to determine the "fair value for rate-seeking purposes of its transportation system in Richmond and extending into Henrico and Chesterfield Counties and to fix such rates and charges as shall be just and reasonable" was filed on April 17. The city filed a petition asking that it be made a party defendant on May 7 and a demurrer on the same date.

Jitneys Made a Political Issue

Springfield Operators Profess to See Opportunity to Return by Election of Mayoralty Candidate Favorable to Them—Railway Now Operating Buses and Is Prepared to Expand Co-ordinated Service

THE transit situation in Springfield, Mass., presents a picture of seeming contradictions. Not since last May have any buses been run in that city in local service except by the Springfield Street Railway. At that time Mayor Leonard put into effect his rule against jitney operation. A year ago he said that he would do this, so that the jitneys had lived only on sufferance since that time. A trial was made of operation on a plan of voluntary contributions, but this was merely a gesture. The jitney men felt that there was no hope for escape from the ruling of the transportation board, made up of five members of the City Council and the Board of Aldermen, but the jitney men were determined to compel resort to the law on the part of the city officials.

While jitney competition with the Springfield Street Railway was lively, it never reached proportions attained in some other cities. It is estimated that only about 5 per cent of the total number of passengers hauled in the city were handled by the jitneys. The jitney men contend, of course, that this business was largely created by them. Too many variable factors apparently enter into the case to determine definitely whether this contention is correct. In any event, even spokesmen for the jitney men admit that the service they gave was not all that could be desired either as regards headways or types of vehicles operated. Better buses, they say, would have been put into service except for the threat of their complete expulsion from the city, which, like the sword of Damocles, hung over their heads a year. Opponents of the jitney are not so sure of this.

The bus men made their fight before the Mayor and lost. Mr. Leonard proved obdurate. One thing has been established beyond doubt. The Mayor is determined. He is not contemptuous of public opinion, but he is a man of decided opinions. A minority, organized or unorganized, has no terrors for him. Both friend and foe pay him tribute on this score. On more than one occasion he has brought down upon his own head the scorn of a particular part of the public which he has opposed, but in every instance the general opinion is that his public acts have been grounded on the conviction that he acted in the best interests of the city. On the other hand, partisan politics is charged by the jitney interests against the members of the Transportation Board or a majority of the members of that committee. This charge is, of course, stoutly resented by the members of the board. The board merely concurred with the Mayor in his decision that "the competition of independent jitney buses must be eliminated for the public welfare."

Anyway, the whole matter has got into politics. The local election in Springfield does not occur until Dec. 2, but the events incident to the national election on Nov. 4 were in some cases overshadowed by the impending local primaries which follow closely upon that event. Mayor Leonard has no desire to remain in public office, so that as an issue his recent acts do not enter into consideration except in so far as his successor might be inclined to follow the course of action by him which has resulted in the elimination of the jitneys.

In the early stages of the campaign

there were three prospective candidates, Josiah Dearborn, present city solicitor under Mayor Leonard, and Fordis C. Parker, chairman of the Board of Public Works, both Republicans, and Richard J. Talbot, counsel for the jitney men, an independent in politics and at various times a Republican and a progressive follower of Roosevelt. Every one knows where Mr. Talbot stands. He is for the jitney, first, last and all the time. Necessarily, he is a partisan. He is probably not the radical partisan that some of his opponents are inclined to make him out to be. It is certain that he will run for office. He may run as a Democrat if he gets the indorsement of that party, but run he will in any event. He can run as an Independent, for he has canvassed the situation and has indorsements sufficient to assure him the right to run. If he runs independently, Mr. Talbot will make the issue one of better transportation, meaning, as he sees it, that the jitneys have a place in the transportation field of that city. He says the jitneys are willing to go back at a 6-cent cash fare with five tickets for 25 cents. The jitneys formerly charged 7 cents. This is the same fare that was charged by the railway, but since the increased pay was awarded to the railway men, the railway fare has been made 10 cents cash, with three tickets for 25 cents.

Mr. Parker has promised that in the event of his nomination by the Republicans he will have an expert appointed to look into the transportation situation, and that if a report is made to the effect that the Springfield Street Railway is not doing all in its power to afford proper service, he will favor the return of the jitneys. Mr. Dearborn, the other candidate, did not at first commit himself to any fixed policy with respect to transit matters, but in a speech which he made on Nov. 3 indicated that he believed in the necessity of preserving the railway. He thought that a city-wide committee should be appointed to determine the minimum number of additional buses required for reasonable transportation and that the railway should be afforded a chance to indicate its own willingness to meet the situation failing which licenses should be issued to the jitneys up to the number of vehicles regarded as necessary. At the Republican caucus on Nov. 11 Mr. Parker was nominated. The Democratic primary is on Nov. 14.

But the story isn't all one-sided. Stories of this kind seldom are. The province of the outside observer is to write about them dispassionately. In the eyes of the participants, however, this he seldom does, for either one side or the other and sometimes both sides see matters through a glass darkly. One thing is certain above all others, the spirit of civic consciousness in Springfield is very highly developed. In view of the controversy over the right to run jitneys, this statement might at first be regarded as a contradiction, but it is nevertheless true.

As the railway sees it, the bus prior to last May was sucking its life blood. The story of increased railway operating costs in recent years is an old one. As proof of the correctness its contention of the narrow margin which has been left to it on which to operate, the railway cites the verdict favorable to it by the State Department of Public Utilities permitting it to increase fares. This increase was put into effect on Sept. 21. Previous to that time the fare was 7 cents. Fares were advanced with the sanction of the state body only after an arbitration award had been rendered increasing the pay of trainmen. Riding has fallen off, but an opportunity has not yet been afforded to determine what the real results are likely to be. At any rate, the railway agreed a long while ago to put in buses, and this it has done. At the present time it is operating nine up-to-date buses (one Stewart, one Yellow Coach, one Selden, four Garfords, one Federal and one White) on four routes giving adequate service to territory in which the railway lines do not operate. A general system of transfer is in effect which permits riding in one general direction, and cars and buses alike exchange transfers. The fare on the buses is the same as on the cars.

The railway stands committed to an extension of this program of co-ordination. Its contention is that it does not fear competition, but that competition means operation of two systems of transport under the same conditions. It has about 195 miles of track. Practically all of the various lines are operated over a stretch of Main Street extending from Carew to State Street, a distance of about a mile. The scheduled running for this stretch through the center of the business district during the rush hours is 12 minutes, but this is seldom achieved, and on stormy nights 30 minutes is frequently taken to make this run. The railway would gladly reroute some of its lines, but as Main Street is the principal business artery, the commercial interests have frowned on any such proposal.

This is just one of the contradictions in the situation to which reference was made in the beginning. The general feeling is that the railway did well to continue for as long a time as it did on a 7-cent fare.

The attitude of Mayor Leonard and the Transportation Board must be taken as reflecting public opinion, the proponents of the bus to the contrary notwithstanding. Critics of both are to be found, however, in all walks of life. It is no reflection upon the bus as a vehicle of transport to say that many harsh words were said about that vehicle as independently operated. There is a supervisor of traffic to look after things in the interest of the city, but many of the buses were not up to date and they were generally operated indifferently. To this the spokesman of the jitney men, as said before, replies that the threat of compulsory suspension which hung over the heads of the jitney men militated against their doing much better.

Business men everywhere express the hope that the coming election will result in the matter being settled for all time. They are not optimistic of that outcome, but the general opinion is that the people are too well informed to permit the jitneys to return on anything like the basis upon which they were formerly run.

One-Man Car Issue at Dayton Before Court

District Judge Smith Hickenlooper on Dec. 1 will hear a motion filed by City Attorney J. B. Harshman of Dayton, Ohio, asking the dismissal of the case against the use of one-man cars in Dayton on the grounds that no federal question is involved.

The five railways operating the cars in Dayton secured a temporary injunction against the city in the federal court the latter part of January, 1924, and the case has been pending since.

At the election in Dayton on Nov. 2, 1924, residents of the city voted to discontinue the one-man car service in the city. An ordinance was immediately drafted giving the railways 90 days in which to organize the two-man car system. Another extension of 30 days was granted. This put off the date of the discontinuance to Feb. 1, 1924. Upon a petition filed in the federal court by attorneys for the companies a temporary injunction was granted restraining the city from enforcing the ordinance until the case was settled.

Rapid Transit Referendum Suggested for Chicago

A resolution for a referendum of Chicago voters in February on the subject of a city-built subway has been introduced in the Chicago City Council by Alderman Kostner. He expressed the belief that the administration would be unable to get any of its numerous transportation plans ready for the February ballot because of the intention to pass on all details first. He wants simply a vote which might be construed as a mandate to build some kind of tube system under downtown Chicago, and his preference is for one linking with the elevated and surface lines at the north and south ends of the loop.

Fares Cut in Fitchburg to Stimulate Riding

Officials of the Fitchburg & Leominster Street Railway, Fitchburg, Mass., have announced that the fare reduction on the so-called Southside lines of the company has been approved by the Department of Public Utilities and has been put into operation. The same reduction has been put into effect on the Westside line in Leominister. Passengers still pay a 10-cent fare, but they receive a return check. If the check is used the same day it is issued patrons make the round trip for 10 cents, instead of 20 cents. No transfers are issued and the check is good only for that line. The reduction in fare is an experiment. It will not be continued if riding on the line is not stimulated.

New Fare in Force in Boston

The Boston Elevated Railway put its 6-cent fare into operation on Nov. 5 on its short-haul lines. On the bus lines operated by the elevated additional steps have to be taken to instal the 6-cent fare, it being necessary to obtain the consent of the municipalities in which the bus lines operate.

Bus Tax Amendment Fails in California

An amendment to the constitution of California designed to place bus companies in that state on the same basis of taxation as the other public utilities was defeated at the recent elections. The measure lost by a vote of 75,000 out of a total of 750,000. The amendment was sponsored by the California Motor Carriers' Association. Its defeat is attributed principally to the opposition of the farmers and local taxing bodies and to the vote of a section of the public that is said to have regarded the impost as insufficient.

"Amendment No. 1" as it was called, was officially designated on the ballot as "State Taxation of Highway Transportation Companies." It was presented by the association to the voters as a means of equalizing the taxes of bus lines and putting them on the same basis of taxation as the other public utilities that contribute the chief revenues of the State.

It provided for the substitution of a state tax on gross earnings for other taxes to which the bus lines are now subject but did not exempt them from the state gasoline tax. It would also have maintained the present state rate of 4 per cent on gross earnings until the rate was changed by the Legislature.

The Motor Carriers' Association now represents the interests of 677 motor transportation lines in California—substantially the entire highway transportation industry that has been built up in the state within the past two decades and which last year accommodated more than 29,000,000 passengers.

Pittsburgh Pass Puts Sunday Back on Traffic Map

Nov. 2 was the second Sunday of the "Sunday-only" pass of the Pittsburgh Railways. The results attained indicated that all that was needed was to give the public of so large a community a chance to understand what the privilege meant.

On Oct. 26 17,500 passes at 25 cents each had been provided, but so great was the demand that most conductors were sold out by noon. The number actually sold was 15,179. This was equal to 9.1 per cent of the receipts. On Nov. 2 pass sales amounted to 33,168, or 18.8 per cent of the receipts.

The company had already in operation a liberalized Sunday transfer costing 10 cents or 20 cents for just one round trip. The effect of the pass the first Sunday was to cut the sale of these transfers from a former average of 18,000-19,000 to 16,013. On the second Sunday, despite the enormous increase in the sale of 25-cent passes good for any number of rides, 12,258 specials were sold. This itself was double the number sold before the 10-cent transfer was liberalized to give a full 8⅓-cent ride on each side of the center. It may seem curious that so many persons would not pay an extra nickel for unlimited service, but it is likely that even if the number of specials decreases there will still be a market for this particular transport bargain.

The Sunday pass innovation has met with much praise from various elements of the public. Aside from the good-will effect, the revenue has shown a most gratifying increase. The second Sunday, which really gave the pass its first opportunity, produced $42,786. This was $4,230 in excess of the same Sunday last year and $2,500 in excess of the average of the four Sundays preceding Nov. 2.

Bus Bids Made in Indianapolis

After nearly three hours of arguments on the part of those who participated in a recent public hearing the Board of Park Commissioners at Indianapolis has indicated that if the Indianapolis Street Railway does not submit a definite proposal for handling transportation on Capitol Avenue north of Fortieth Street within two weeks, the proposal of the People's Motor Coach Company would probably be approved. Robert I. Todd, president of the railway, said a definite proposal will be submitted. Mayor Shank asked how soon each could begin operation on Capitol Avenue.

"I'll guarantee them in sixty days," Mr. Bowman answered.

"I'll guarantee them in thirty days," Mr. Todd retorted.

"This question of bus transportation is becoming serious," Mayor Shank said at one point. "Everyone knows that without a street car system the city wouldn't be worth a nickel. However, I think that Mr. Todd should promise to give relief immediately to people in the north part of Indianapolis who demand some method of transportation."

$25,000,000 Rapid Transit Program Outlined for Philadelphia

Plans for a Chestnut Street surface car subway and transit service over the Delaware River bridge were outlined on Nov. 10 at a special meeting of the city's Transit Commission by Thomas E. Mitten, chairman of the board of directors of the Philadelphia Rapid Transit Company, who suggested that the city finance its construction.

The plans provide for a subway under Chestnut Street from Fifth to Twenty-third Street, where it would continue as an elevated line westward over the Schuylkill River, and thence on Sansom Street to Thirty-seventh Street. There would also be underground sidewalks from Sixth Street to Nineteenth. Mr. Mitten estimated the cost of the subway at about $20,000,000 and the sidewalks about $5,000,000. He said if the city authorized the construction the transit company would undertake to pay the interest and sinking fund necessary to retire the $20,000,000 during the life of fifty years, bonds to be issued by the municipality.

On Nov. 13 the company offered to spend $500,000 to build tracks across the Delaware River Bridge and a loop in Camden, to maintain those tracks, to provide equipment and to furnish service to and from Camdem at the same rates of fare and with the same transfer privileges that may prevail in Philadelphia, provided it received exclusive operating rights.

Municipal Bus System Knocked in Head

New York City has no right to own and operate buses, Corporation Counsel George P. Nicholson stated in an official report to the Board of Estimate of that city, Nov. 10.

Comptroller Charles L. Craig, whose bills introduced into the Municipal Assembly recently to provide for city ownership and operation of buses were the reason for the corporation counsel's report to the board, declared that Mayor John F. Hylan and his supporters were attempting to intimidate the Municipal Assembly. He said that the corporation counsel's report was an effort to defeat his bus bills by convincing the members of the local assembly that they had no legal right to pass them. On Nov. 14 Mr. Craig again insisted that the city has the right to legislate on the bus matter just as the Legislature had this exclusive right before the passage of the home-rule act last winter. Another hearing is set for Nov. 17.

I. T. S. Line Renews Wage Agreement

Employees and officials of the St. Louis Electric Terminal Railway, a subsidiary of the Illinois Traction System, operating between St. Louis, Mo., and Granite City, Ill., via the McKinley Bridge, reached an agreement regarding wages and working conditions at midnight on Nov. 7. The settlement calls for a continuation of the wage scale that expired on Nov. 1.

The workers had demanded an increase from 58 cents to 61 cents an hour effective from Oct. 1. Company officials held out for a decrease of 5 cents an hour. It was finally agreed that the old wage scale and working agreement should continue in effect until Nov. 1, 1925.

$9,531,204 in Subway Contracts Awarded in New York

The Board of Transportation, which now is charged with responsibility for all new subway construction and routing in New York City, on Nov. 11 awarded three contracts, aggregating $9,531,204, for the construction of the extension of the Fourteenth Street-Eastern District subway from Boerum Street and Bushwick Avenue to Wyckoff Avenue and Halsey Street, 2.14 miles, in Brooklyn. The contracts, in accordance with the law, were submitted to the Board of Estimate for approval.

To expedite construction the extension is to be built in three sections. The first section, 0.7 of a mile, was awarded to the Underpinning & Foundation Company for $2,733,227. The second section, 1.85 mile, was awarded to the Oakdale Contracting Company for $3,595,038. The third section, 0.59 of a mile, was awarded to the Oakdale Contracting Company for $3,202,939.

Under the provisions of these contracts the route will have to be sufficiently completed for the operation of trains within twenty-eight months and finished entirely within thirty-three months from the time that work is commenced by the contractors.

First Railway Bus Line in St. Louis Opened

The St. Louis Motorbus Company, a subsidiary of the United Railways, St. Louis, Mo., opened its first bus line on Sunday, Nov. 9. The line operates on Natural Bridge Avenue from the end of the Natural Bridge division to Line Lawn in St. Louis County, intersecting the Union boulevard line and the Kirkwood-Ferguson division.

For a 10-cent fare passengers are furnished a transfer to the United Railways city street cars, while street car patrons who desire to transfer to the buses receive a transfer for an extra 3-cent fare, as the city car fare is 7 cents.

Four single deck buses constructed by the White Company have been installed on the line. Each bus holds twenty-nine passengers. The driver collects the fares as the passengers enter.

Electrification and Motor Haul Data Sought by I.C.C.

In its annual report form, to be sent out to all railroads about Dec. 1 and returned by March, 1925, the Interstate Commerce Commission will request data on the use of electricity for motive power, and information regarding gasoline-propelled railroad cars. The commission will also seek to find out the results attained with the use of motor trucks by the companies as supplementing regular service. Some of the country's railroads, including the Pennsylvania, utilize motor trucks on short hauls.

The most recent available figures of the commission show that the eastern part of the country has 286 electric locomotives in heavy railroad operation; the south has 17 and the west has 69. Most of the big railroads of the country have portions of their lines electrified now.

Joint Operation in Texas a Success

The Dallas-Denton line of the Texas Interurban Company has not produced the business expected of it by the management. This statement is based on returns for the first month of operation. According to General Manager Richard Meriwether, the combined traffic is barely enough to pay operating expenses, but the returns from freight and express have been good. He is quoted as follows:

> The first month the line has been in operation has demonstrated the practicability of using the same tracks for steam and electrically driven cars, but aside from that the results so far are rather disappointing. We hope the business will increase as the people of the territory become familiar with the service. There are enough people in that territory to produce a satisfactory business, and we are confident it will come to us when everybody along the line begins to use the interurban cars.

The Texas Interurban Railway is co-operating with the Missouri, Kansas & Texas Railroad in operating a joint line between Dallas and Denton. Joint operation was planned when the interurban company, in fulfilling a contract with the city of Dallas, decided that Denton was the best town in the surrounding territory to include in the network of connecting electric lines. A proposition was made to the railroad company to rent its track, obviating the construction of a parallel road.

A joint dispatching system, under the supervision of the steam line company, is maintained. Each electric passenger train and each steam passenger train is considered first-class, the electric express train second class and the steam freight trains third class.

The interurban company pays a stipulated rental monthly for the use of the track, and in addition pays a sum for the maintenance of the right of way, and its pro rata share of the dispatching cost.

Results with Trackless Line at Baltimore Disappointing

The United Railways & Electric Company, Baltimore, Md., is seeking a way to minimize the loss on the trackless trolley between Gwynn Oak Junction and Randallstown. When the trackless trolley was first proposed, Liberty Road residents made a contract with the railway in which they agreed to make up deficits in the operation of the line to the extent of $10,000 the first year, $7,500 the second year and $5,000 a year thereafter, until $37,500 had been paid.

The trolley was placed in operation in July, 1922, and the Liberty Road residents have had to pay the first two years' installments on the deficit guarantee. The contract has three years to run.

A statement by the railways says:

> The United Railways has been steadily losing money on this line.
>
> The guarantee has never equaled the deficit. Our officials have been conferring with officials of the Public Service Commission for some time in an effort to work out a satisfactory solution.
>
> The company has no intention of abandoning the territory. We will continue to give the people there adequate transportation service, but some way must be found to minimize our losses.
>
> Operating economies will have to be brought about. Perhaps that can best be done by substituting gasoline buses.
>
> The company has no intention of asking for an increase of fare on the line, nor an increase of the guarantee fund posted by the citizens there.

Buses Run by Railway at Sapulpa

Bus service has been substituted for railway service in Sapulpa, Okla., and started between Mounds and Okmulgee. Electric railway service in Sapulpa, a town of 11,600, could not be made profitable. Two short lines will be abandoned entirely and about 1½ miles of track probably will be removed. The Mounds-Okmulgee buses will be operated pending completion of the electric railway extension from Mounds to Okmulgee, after which the buses will be used as feeders to the electric line on such routes as offer possibility of developing business. J. A. Frates, vice-president of the Oklahoma Union Railway, states that the company expects to add buses as line feeders as rapidly as the electric line is extended until all tributary territory is given adequate service and annexed by interurban lines to the system being developed by that company. The bus service is being given in the name of the Union Transportation Company.

New Buffalo Bus Line Starts

Double-deck buses were placed in service on Delaware Avenue, Buffalo, N. Y., on Nov. 2 by the International Railway. The fare is 10 cents. This line will be extended to Kenmore Avenue at an early date, and the Delavan Avenue line will be opened as soon as buses can be secured. Free transfers are given with connecting street car lines in a forward direction.

Buses now in use are of the open-top type, seating 67 passengers, as now operated on Fifth Avenue—New York, and Roosevelt Boulevard—Philadelphia. These buses, however, are for temporary use, and will be replaced in the early spring by the Mitten-Management bus, which has a front exit, inside stairway, semi-enclosed top and electric drive. The company says:

> Traffic congestion is becoming more and more alarming in Buffalo. It will be greatly relieved by a proper use of the bus. Sixty-seven seated bus passengers occupy about the same street space as 4 private car passengers, and when the automobilist learns of the speed and comfort possible for a 10-cent fare, he will hesitate before assuming the cost of bringing his private car into the downtown traffic, and inflicting upon the public generally the delays caused by over-congestion in the city streets. A regular motorbus service will appeal to the economical motorist as well as the comprehensive city planner.

More One-Man Cars for Milwaukee

Following a series of hearings covering nearly a year before the Railroad Commission on the petition of the Milwaukee Electric Railway & Light Company to introduce one-man cars on its Clybourn Street line a permit has been granted to establish the service. Testimony introduced before the commission showed that the company has found it absolutely necessary to reduce operating expenses wherever possible in order to give car riders adequate service at a reasonable fare.

The equipment to be used on the Clybourn line will not be like that in use on the three other one-man lines in the city. The company proposes to equip the Clybourn Street line with cars of the rear-door type so as to facilitate the unloading of passengers, especially in the downtown section of the city.

As indicated in the ELECTRIC RAILWAY JOURNAL for Nov. 8, page 821, an application by the company to extend its one-man car service to the Walnut Street line is now pending before the Railroad Commission.

More Bus Permits Issued to Public Service

Permits have been issued by the Board of Public Utility Commissioners of New Jersey to the Public Service Transportation Company for the operation of 17 buses on the Passaic-Garfield-Lodi route. This route is about 4 miles long. It parallels on the same streets the tracks of the Public Service Railway, of which the bus company is a subsidiary. The rate of fare is to be 5 cents from Burgess Place, Passaic, N. J., to the end of the line in Lodi. The railway has discontinued its trolley service on the Main-Lodi line in Passaic, Wall and Main Streets and Passaic Avenue and on its private right of way from Main Street, Lodi, to Lodi Junction, and has substituted buses.

Co-ordination Proposed at Topeka

A. M. Patten, general manager of the Topeka Railway, Topeka, Kan., has admitted that plans have been discussed looking toward the establishment of a service with buses by his company in co-ordination with the railway lines. The tentative plans now being considered are for the buses to enlarge the trade territory of the North Topeka merchants by extending operation beyond the city limits.

Whether the buses are to be operated from the ends of the present lines or whether they should operate from the south side of the river, the street cars being eliminated north of the river, still is a matter to be decided.

It is stated that the railway officials are considering a plan whereby the street cars would be operated to the Union Pacific station and passengers for other than the trains, to be transferred there to buses.

The Topeka system is controlled by the Illinois Power & Light Corporation, which is successfully operating buses in co-ordination with its railways lines in other cities, notably Wichita, Kan., and Decatur, Ill.

Interurban Passengers to Go Into Detroit by Bus

Interurban cars of the Detroit United Railway will probably cease to operate at the Detroit city limits on Dec. 1 under a plan to put a system of buses into operation for transporting interurban passengers from the city limits to the company's main terminal station at Jefferson Avenue and Bates Street. The company's outbound buses will be reserved for interurban car passengers.

Incoming passengers will leave the cars at sub-terminals, to be established by the company, and there board buses. Outbound passengers will be transported in buses from the interurban station in the business center of Detroit to the city limits to board the cars at the sub-terminals.

After the new bus system is put into use the parlor cars of the railway will be the only interurbans to proceed over the city streets to the main terminal station.

At least 50 buses will be placed in service. They have been ordered from the Yellow Coach Company, Chicago, and are to be of the single-deck type.

The D.U.R. already has buses in service on its Trenton division covering the entire interurban route. A sub-terminal and transfer station on Gratiot Avenue is being completed and will be the first one used. It will be followed by two others so that the buses on the Pontiac and Mount Clemens division will not go farther than the city limits.

News Notes

$169,000 Spent in Grand Rapids.—Keeping pace with the development of Grand Rapids, Mich., the Grand Rapids Railway up to Nov. 1 spent $169,000 this year in improving its service. The largest projects were in the downtown section to relieve traffic congestion.

Fare Increase Sought for Interurban.—The Virginia Railway & Power Company, Richmond, Va., has petitioned the Virginia State Corporation Commission for an increase of fares on the Richmond-Petersburg interurban electric line. The company is not receiving a reasonable return, the petition alleges.

Wisconsin Town Bans Bus.—Acting on the conviction that street cars offer all the people the safest and cheapest form of transportation, the village board of Port Edwards, Wis., has passed an ordinance which it believes will protect the Wisconsin Rapids Street Railway, an 8.25 mile line, against unregulated bus competition. The ordinance requires the payment of $5 a day for each bus operating on the streets in the village. Violators of the ordinance will be fined from $1 to $100 for each offense, or may be sent to jail for 90 days.

North Shore Purchase Postponed.—The Board of Estimate of New York on Nov. 7 decided to put off the matter of approving the contracts for the purchase of the rights and interests in the New York & North Shore Traction Company for $50,000 and also the question of authorizing Controller Craig to buy the carhouse and yards on State Street, Flushing, for a sum not exceeding $15,000.

Extension of Franchise Sought.—A request for a 20-year franchise to operate cars in the city of Piqua has been filed with the city by the Western Ohio Railway. The company's franchise expires in two years.

Offices of St. Joseph Company in New Location. — The St. Joseph Railway, Light, Heat & Power Company, St. Joseph, Mo., has opened for business in its new quarters in the Tootle Building, Sixth and Francis Streets. The offices of the general manager, superintendent of railways, engineering, accounting, claim and publicity departments took up quarters in the new building some time ago. The company has occupied its present quarters since the old Tootle Building at Sixth and Francis Streets was destroyed by fire two years ago. In its new location the company will occupy all of the west half of the first floor, fronting on Francis Street, and the entire second floor. The salesrooms will be on the first floor.

School Buses Run by Railway.—Two morning and evening school bus runs for the exclusive use of pupils of the Fremont High School, Los Angeles, Cal., were started by the Los Angeles Railway on Nov. 3.

Deadlock on One-Man Car Operation.—The city of Quebec and the Quebec Power Company, Ltd., are deadlocked on the question of the number of men who will operate the street cars of the city. Unless the company meets the demands of the city the fare will, on and after Nov. 15, revert to 5 cents, the rate charged in 1919. At present the rate is 7 cents.

Electric Extensions Planned.—It is reported that a steam railway line, with electric extensions, is being planned to span the oil fields, east and west, of northern Oklahoma. C. E. Burlingame, Bartlesville, is head of the temporary organization. The company is to be capitalized at $1,000,000.

More Bus Permits Sought.—The Los Angeles Railway Corporation, Los Angeles, Cal., has applied to the Railroad Commission for a certificate to operate bus service along a portion of Florence Avenue from the city of Los Angeles to the city of Huntington Park.

Insurance Policies for Nashville Employees. — The Nashville Railway & Light Company, Nashville, Tenn., through J. P. W. Brown, its general superintendent, has announced that it had issued life insurance policies of from $500 to $1,500 to its 1,089 employees. At the same time, B. C. Edgar, vice-president and general manager of the Tennessee Electric Power Company, of which the Nashville Company is a subsidiary organization, announced that a total of 2,800 employees had been given similar policies totaling $2,000,000. Protection by these policies became effective on Nov. 1. The contract for this insurance was given to the Provident Life & Accident Insurance Company, which has its home office in Chattanooga.

Tells About Railway and Bus Operations.—Service to the public was stressed by the Altoona & Logan Valley Electric Railway and Logan Valley Bus Company in connection with the Better Homes Exposition staged by Altoona, Pa., merchants and corporations. The railway had a booth with company employees in attendance. The booth contained a large map showing the territory over which the company operates, giving the trolley lines and bus routes. Numerous placards contained company statistics and gave the salient features of traffic conditions. Other bulletins announced that the Logan Valley trolley cars and buses hauled 19,000,000 passengers in one year, the cars traveling 3,000,000 car-miles. The company used 21,000 tons of coal, employs 360 men and women, operates 132 cars on 576 miles of track, and it informed the visitors through a placard that wages have increased in the past ten years by 100 per cent, materials have increased 70 per cent and fares but 40 per cent.

Bridge Will Be Constructed.—The vehicular traffic and street car bridge across the New Basin Canal at Carrolton Avenue in New Orleans, La., will be built. The New Orleans Public Service, Inc., sought to have it erected, and offered to advance the cost of construction, estimated at $150,000, to be reimbursed subsequently by the city of New Orleans. Action on the matter was delayed by a ruling of the City Attorney's office, which has been removed. The bridge will have a double street car track, with ample space on either side for vehicles and two lines of traffic.

Financial and Corporate

Surplus Increased

Montreal Tramways Has Surplus of $548,695 Compared with $347,553 in 1923 and $187,947 in 1922

The thirteenth annual report of the Montreal Tramways, Montreal, Que., shows separately the results obtained from the operations under the contract with the city and the share of the gross revenue accruing to the company under the provisions of the contract and its disposition. The report of the president and directors was recently submitted to the shareholders. It is for the year ended June 30, 1924.

Operations under the contract show a gross revenue of $12,463,799, which included $12,131,181 for passenger earnings. The total operating expenses amounted to $8,875,224 and the net earnings were $3,588,574. After the distribution of the net earnings, the total revenue from the contract, together with the operating profit of $48,555, equaled $2,358,448. An amount of $181,431 was carried direct to "Reserve for Financing." To the city of Montreal for the yearly rental the sum of $500,000 was given, and for payment on account of accrued rentals unearned in previous years $548,695, which, added to the company's revenue from the contract and expenses for financing, makes $3,588,574. The city rental up to June 30, 1924, amounts to $3,192,694, of which sum there has been earned $2,809,056, leaving a balance of unearned rental payable as earned of $383,638.

The share of the gross revenue for the year accruing to the company, together with the miscellaneous revenue from other sources, shows a distribution of total revenue of $2,449,175 and total expenses of $1,885,621, leaving a net income of $563,554. Subtracting a dividend total of $400,000, the surplus for the year was $163,554. A sum of $592,979 is added to it for the surplus at June 30, 1923, giving a total of $756,533. There has been charged against this account $87,780 for the value of discarded property, leaving a balance in the general surplus account of $668,753.

	Year Ending June 30, 1923	Year Ending June 30, 1924
Gross receipts	$12,056,355	$12,463,798
Operating expenses and taxes	6,099,993	6,246,889
Operating profit	48,304	48,554
Maintenance and renewals	2,492,792	2,579,779
Total	8,641,090	8,875,224
Balance	3,415,264	3,588,574
Allowances due company:		
Six per cent on capital value	2,177,177	2,177,177
On additions to capital	164,973	175,918
Six per cent on working capital	2,530	5,351
Financing expense	181,431	181,431
Total	2,526,113	2,539,879
Balance Dr.	a889,151	a1,048,695
Payable when earned:		
City of Montreal rental	500,000	500,000
Contingent reserve fund	b41,597	....
Total	541,597	500,000
Deficit	....	....
Surplus	$347,553	$548,695

a Surplus.
b The contingent reserve fund is limited by the contract to $500,000

During the year the company expended on new construction $1,145,505 and has written off capital account for the value of property discarded $377,466, making a net addition to capital value of $768,038. During the year the company purchased 25 new motor cars and 25 new trailers.

The efforts of the company to meet demands upon its system is reflected in the large amount of new construction work carried on throughout the year.

A comparison of operation for the year ended June 30, 1924, with the previous year is given in the accompanying table.

The annual meeting of the company was held on Nov. 5. The directorate is now composed of Julian C. Smith, president; Howard Murray, Gordon W. MacDougall, George H. Montgomery, J. L. Perron, William C. Finley, Col. J. E. Hutcheson, Lorne C. Webster, Beaudry Leman, Senator Casgrain. Mr. Hutcheson, the general manager, was in addition made a vice-president.

Foreign Tramway Issue Sold in New York Market

Instances are being presented almost daily of the growing participation of United States investors in the work of helping to finance issues of foreign origin. In the past these operations have been confined very largely to government and municipal issues and to the securities of some of the better known steam railroads. On Nov. 10, however, announcement was made that investors at home had bought $1,400,000 of Christiania Tramways Corporation two-year 5 per cent gold notes. The subscription price was 100¼ and interest, to yield about 4⅞ per cent. The offering syndicate comprised White, Weld & Company, Blair & Company, Inc., and Brown Brothers & Company, New York.

The Christiania Tramways Corporation was organized on May 1, 1924, as a consolidation of the two privately owned companies. It does all the street railway business in the city, serving a population estimated at 260,000. Fifty-one per cent of the stock of the company is owned by the city, which is the capital and largest city of the Kingdom of Norway. The city unconditionally guarantees the note of the company by indorsement. The note to the bank is in the form of a single instrument. Certificates of participation in the denomination of $1,000 each are to be issued by the National Bank of Commerce, New York, trustee.

10.27 Cents per Passenger Is Cost on Staten Island Lines

Transit Commissioner LeRoy T. Harkness has made public the substance of a special investigation made by order of Controller Charles L. Craig of the city of New York which showed that some of Mayor Hylan's municipally operated trolley lines on Staten Island had sustained losses of $57,118 in eighteen months. It was disclosed further that the actual cost of every so-called "5-cent ride" on the routes examined was 10.27 cents.

The Craig report was prepared by R. B. McIntyre, a statistician of the Department of Finance. It states that from Oct. 14, 1921, to March 14, 1923, the total revenue earned by the lines was only $54,171, while the operating and maintenance expenses were $111,289.65.

Commissioner Harkness said that similar losses were now being incurred on the other municipal lines operating on Staten Island, despite the use of policemen to help in the task of loading at the ferry station, the help of trucks belonging to a city department and the aid of labor from other branches of the city government. He said:

> If a strict accounting were kept of what the city actually spends in maintaining these lines, the Department of Plant and Structures would show an appalling financial loss on all.

In commenting upon the assertion that the actual cost of every ride is 10.27 cents, the report says:

> In other words, every passenger paying 5 cents has been riding at the expense of the taxpayers of the City of New York to the additional extent of 5.27 cents.

Despite the excessive cost of operation, Mr. Harkness pointed out, the Staten Island service has been so inefficient and inadequate that residents are demanding the installation of bus routes and extension of a steam railroad. He said:

> The operation of the Staten Island trolleys by the city has been so extremely atrocious that, if it had been the performance of any private company under the jurisdiction of this Transit Commission, it would not have been allowed to continue, by application of the statutes which govern negligent and ineffective operation.
>
> From the standpoints of safety, of service and financing, the attempt of Mayor Hylan to furnish transportation has been a pathetic failure.

Mr. Harkness's statement followed a number of protests by Staten Island commuters, who asserted that they were facing a winter of unheated cars, inadequate in number and running on uncertain schedules.

In confirmation of these protests, Mr. Harkness made public a report by William O. Smith, Transit Commission inspector, to George F. Daggett, chief of the Transit Bureau, which cited instances of overloading on several Staten Island lines, ranging from 102 to 350 per cent.

New Wisconsin Valuation Policy Attacked

Public utility companies in Wisconsin, through the Wisconsin Utilities Association, are protesting against the Wisconsin Tax Commission's new valuation policy toward them. This policy is on a basis of 100 per cent of the present value regardless of the percentage used by local assessors in valuing other private property. General property, however, is assessed at 80 per cent, while the properties of gas, electric and electric railway companies will be assessed 100 per cent of their true value. The association brands the new policy as unjust and discriminatory unless it is extended to all property owners.

Further Progress Reported in St. Louis Reorganization

Argument before the court in the suit of the St. Louis & Suburban Railway bondholders for a separate receivership and foreclosure on that portion of the United Railways set for trial in the United States District Court in St. Louis has been continued until Nov. 15. As a consequence it is freely predicted in St. Louis that an early agreement with the Suburban bondholders will be reached by the reorganization committee of the United Railways.

It is said that only one point remains to be cleared up, the question of the period of extension of the maturity date of the $4,500,000 Suburban bonds. A virtual agreement has been reached on all other points at issue, it is said. It is possible that when the Suburban foreclosure case is again called before Judge Faris announcement will be made that an agreement has been reached covering all the points in dispute.

San Francisco Municipal Line Using Up Capital

Objection to the practice of the San Francisco Board of Supervisors in using depreciation reserve of the Municipal Railway to finance extensions and betterments, has again been over-ridden, although voiced by the city engineer and leading civic organizations. The Supervisors have adopted a resolution declaring they will appropriate $393,180 out of this depreciation reserve to pay for the city's part in driving another tunnel through the western hills to improve transportation into the so-called Sunset district. The tunnel would be used by the Municipal Railway and be paid for through an assessment district and by the city. An effort to authorize a $400,000 appropriation from the city's general fund has been tabled.

There was $1,184,737 in the depreciation fund in April last. Necessary carhouse and car shop extensions and the building of extensions ordered by supervisors, including trackage which would follow the bore, would convert this balance into a $94,000 deficit, it is estimated. Other necessities and proposals, which seemingly depend upon the same fund, if executed would enlarge that deficit to more than $3,000,000.

Observers of the Municipal Railway believe the city is storing up trouble in failing to maintain an adequate depreciation reserve to insure continued operation of the lines in the future. As one observer put it, on the basis of capital cost of properties and their expected life, the present depreciation reserve balance appears wholly inadequate without further withdrawals.

Dividend on Savings Association

At a recent meeting of the board of directors of the Savings & Loan Association of the United Railways, St. Louis, Mo., a semi-annual dividend at the rate of 6 per cent per annum payable to stockholders of record on Aug. 31, 1924, was declared. The sum to be disbursed is $71,000. This brings the total dividends paid in the past twelve months to $134,700. A grand total of $487,000 has been paid to members of the association since it was formed nine years ago. The association comprises 5,369 members, employees of the United Railways and their families. It has placed 1,558 members in their homes. At a special meeting of the stockholders on Sept. 16 the authorized capitalization of the association was increased from $8,000,000 to $9,000,000, the second million in authorized capital stock voted this year.

Schenectady Railway Earnings Improve

News comes from Schenectady, N. Y., that the local railway has turned a 270,000 deficit into a net of $80,000 for the quarter ended Sept. 30, 1924, as compared to the same period of 1923. The figures follow:

	1923	1924
Operating revenues.....	$119,930	$389,837
Operating expenses.....	390,629	309,801
Net revenue	$270,699*	$80,036
Taxes assignable to railway operation	23,847	27,224
Operating income	$294,546*	$52,812
Non-operat. income ...	295	605
Gross income	$294,250*	$53,417
Total deduction from gross income	42,707	53,226
Net corporate inc.	$336,958*	$191

*Signifies loss.

This is the first news indicating that E. M. Walker, president during the past year, is getting under way. The situation in Schenectady is considered one of the worst remaining in the industry. Mr. Walker has had a tremendously difficult task. He is making real headway, but the railway is still a long way from being on a satisfactory basis. What has been accomplished thus far in the way of improved service and better earnings is all the more remarkable in view of the fact that no new money has been put into the property. It seems obvious that further development of the property depends very largely on a program of modernization, which will necessitate new money.

Valuation Finding at Denver Still Before Court

The outcome of the litigation between the city of Denver and the Denver Tramway is expected to be known before Jan. 1 if present plans do not go amiss. The case is before Judge Robert E. Lewis of the United States Circuit Court of Appeals at St. Louis.

It will be recalled that it was Judge Lewis who named Ernest Stenger receiver for the company and authorized an 8-cent cash fare, the company cutting the amount of fare by selling two tickets for 15 cents.

The principal points to be passed on by Judge Lewis is: What is the proper valuation of the company's properties, and what is a fair return on its investment?

In this connection the city claims that the valuation is about $7,500,000. The company says the value is $30,000,000. Special Master in Chancery Dubbs fixed the valuation at $20,105,707. Judge Dubbs' report cited that 7½ per cent was fair on the $20,105,707 valuation. The city takes exception to the valuation of both Judge Dubbs and the company.

$1,000,000 Erie Issue Quickly Subscribed

Myron S. Hall & Company, New York, offered on Nov. 11 a new issue of $1,000,000 Erie Railways first and refunding mortgage 6 per cent bonds, due Oct. 1, 1954. The company owns about 67 miles of track serving a population of 128,000 in Erie, Pa. Valuation of the property by the Public Service Commission of Pennsylvania amounts to twice the total funded debt, while strong provisions surround issuance of further bonds under this mortgage. The bankers report an oversubscription to this issue. The bonds were priced at 95 and interest to yield 6⅜ per cent. The present Erie Railways comprises part of the property formerly included in the system of the Buffalo & Lake Erie Traction Company, segregated following foreclosure.

Power Company After Niagara Gorge Railroad

Application has been made by the Niagara Falls Power Company, Niagara Falls, N. Y., to the Public Service Commission for permission to acquire and hold all or any part of the capital stock of the Niagara Gorge Railroad, operating a scenic belt line in the lower Niagara gorge between Lewiston and Niagara Falls.

The application also asks permission to pledge as security for $1,000,000 of 5 per cent bonds of the Niagara Gorge Railroad an equal amount of 5 per cent bonds of the Niagara Falls Power Company. As its reason for acquiring the stock of the gorge route the application of the power company sets forth that the railroad owns valuable riparian rights along the shore of the gorge for a distance of more than 5 miles; that the Gorge Railroad is the owner of the stock of the Niagara Gorge Power Company, and that the free and paramount use of the railroad is essential in any construction work for hydro-electric development which may be undertaken along the lower Niagara gorge.

Paul A. Schoellkopf, president of the Niagara Falls Power Company, says that the value of the gorge line for scenic purposes is not to be disregarded and no effort will be spared to give the public the opportunity of seeing the lower group from the right-of-way of the electric route.

The Niagara Gorge Railroad is owner of all of the capital stock of Lewiston & Youngstown Frontier Railway, which is operated by the Niagara Gorge Railroad, in conjunction with its own Lewiston-Youngstown line.

Arbitration Award Delay Helps Financing

According to the Toronto *Globe* the intricacies of finance are illustrated by the issue of $7,900,000 in civic debentures to pay the balance due on the purchase price of the Toronto Railway system. Finance Commissioner Ross figures that, while the appeal to the Privy Council over the original award means that the city will have to pay more for the property than provided by the award, in the long run the city will save money. Had there been no appeal from the award when the majority of the Arbitration Board reported on the price to be paid by the municipality for the railway, the city would have had to issue debentures carrying 6.40 per cent interest. In the meantime money has become cheaper, and money that would have to carry 6.40 per cent early last year can be obtained now for 4½ per cent.

Mr. Ross roughly calculated that the delay of more than a year and a half will save the city about $2,000,000. Supposing the amount of the debentures to be issued in 1923 and now was the same, $7,900,000, the difference between one year's interest at 6.40 per cent and 4½ per cent is more than $156,000. This alone will show that the Finance Commissioner's deduction about a $2,000,000 saving during the full life of the debentures is quite reasonable.

Civic railway system debentures totaling about $1,300,000 issued in 1911-1912 carry 4 per cent. Five issues, amounting to approximately $700,000, issued between 1912 and 1915, carry 4½ per cent, and since then issues of about $32,000,000 have carried 5 or 6 per cent.

Stockholders of the Toronto Railway, Toronto, Ont., the property of which was taken over several years ago by the city subject to arbitration of the purchase price, will meet on Dec. 1 to consider the winding up of the company and if this is decided upon to appoint a liquidator. Transfer books will close on Nov. 28 and if the decision to wind up is taken, all transactions in the shares will cease from the date of the closing of the books. The meeting will take the first step in the distribution of assets.

$20,000,000 Issue Placed

The first financing undertaken on behalf of the Cities Service Power & Light Company, the newly created $100,000,000 subsidiary of the Cities Service Company, New York, into which all of the latter's public utility properties are to be placed, consists of $20,000,000 of 20-year 6 per cent sinking fund secured gold bonds, offered by a syndicate headed by Dillon, Read & Company, Federal Securities Corporation, and A. B. Leach & Company, New York, at 94½ and interest, to yield about 6½ per cent. The bonds will be specifically secured by pledge of the common stocks of the six most important operating companies in the Cities Service Power & Light Company, viz.: Toledo Traction, Light & Power Company, (owning the Toledo Edison Company), Ohio Public Service Company, Public Service Company of Colorado, Kansas City (Mo.) Gas Company, Wyandotte County Gas Company (Kansas City, Kan.), Empire District Electric Company (southwestern Missouri), and St. Joseph Railway, Light, Heat & Power Company, St. Joseph, Mo.

Tax Refund Is Denied to the Philadelphia Rapid Transit

The federal government has refused to refund to the Philadelphia Rapid Transit Company $5,000,000 of income and excess profits taxes, which both the company and the city believes were erroneously paid. City Solicitor Gaffney is disappointed at the ruling and has said he would advise the Mayor to take an appeal to the Commissioner of Internal Revenue. The appeal will be based on the ground that the Government's decision is a discrimination against Philadelphia, inasmuch as in a similar case a decision was given favorable to Kansas City.

The Rapid Transit Company early this year appealed to the committee on appeals and review of the Treasury Department for a refund of $5,000,000 in income and excess profits taxes, paid by the company during and since 1917. The appeal was denied. Later the city decided to intervene in the matter on the ground that a section of the former Federal Revenue Act exempted from taxation any public utility in which a municipality or other political subdivision had an interest, such as the city has in the Philadelphia railway system by reason of the agreement of 1907.

Before the city appealed to the federal authorities it entered into a contract with the P. R. T. Company, whereby it was provided that if the $5,000,000 were recovered it should be used by the company for making improvements. The case was argued last August.

The recommendation made by the solicitor to the commissioner follows:

> With the exception of one point, the arguments of the City Solicitor merely reiterate with emphasis those presented by the Rapid Transit Company before the committee. Reference is made to the recommendation for a detailed statement of the facts and contentions. These have been again carefully considered, and this office remains unconvinced that error was committed in deciding that the agreement entered into between the Rapid Transit Company and the city was not such as under Section 11 (b) of the act of 1916, as amended by the act of Oct. 3, 1917, would entitle the corporation to exemption from federal income and excess profits taxes.
>
> The validity of the ordinance and contract may be questioned, for it hardly seems probable that a city would be empowered to act as a collecting agent for a corporation even though it was to receive the total amount collected, and there appears to be no other consideration for the contract, but in any event a sufficient answer to any argument founded upon them is found in the words of the proviso of Section 11 (b):
>
> ". . . whenever any State . . . or political subdivision of a State . . . has prior to the passage of this title entered in good faith into a contract . . . the object of which is to acquire a public utility, no tax shall be levied.
>
> Certainly the tax status of the Transit Company, under the act cited, cannot be affected by a contract entered into in 1924, even though it be in modification of a contract executed in 1907.
>
> It is, therefore, recommended that the protest of the city of Philadelphia, intervening on behalf of the Philadelphia Rapid Transit Company, be denied.

The case was argued orally in behalf of the city before the solicitor on Aug. 7.

Receiver Appointed for Michigan Railroad

The United States District Court for the eastern district of Michigan, Southern Division, Judge Charles C. Sumon presiding, has appointed John F. Collins, Jackson, receiver of the Michigan Railroad. He has been authorized to continue the operation of the railway lines under the direction of the court.

The receiver was appointed on the application of the Union Railway, Gas & Electric Company of New Jersey, owner of all the stock of the Michigan Railroad, excepting directors' qualifying shares, a general creditor of the company to the amount of $1,465,903, for moneys loaned and the holder and owner of $4,000,000 of the company's general mortgage bonds. The company's property is also subject to a first mortgage of $4,050,000, which it was thought could be extended.

The bill of complaint shows that the offer of the company to extend its $4,050,000 of first mortgage bonds, which matured on May 1, 1924, could not be effected because earnings have decreased to such an extent that the company cannot pay the interest.

The Michigan Railroad consists of the high-speed third-rail line operated between Kalamazoo and Grand Rapids, between Allegan and Battle Creek, and a line connecting Bay City, Saginaw and Flint, covering a trackage of 148 miles.

Holders of more than 85 per cent of the face value of the bonds agreed to an extension of the maturity date, but some of the minority threatened suit to collect. In order equally to protect all the holders the receivership action was started.

Modification Sought for Plan of Abandonment

An unusual situation was created recently by the announcement that the Visalia Electric Railroad, Exeter, Cal., had asked permission to continue a mail and express special car to handle mail and express business which, in the request for abandonment of passenger service, it had been assumed was to be dropped. The Visalia line is 54 miles.

The Al Askin Stage Line has been granted a permit to operate between Visalia, Woodlake, Lemon Cove and Exeter, replacing the service of the Visalia Electric Railroad, but Manager E. L. Askin stated that company will not begin operations until there is something definite done about mail and express business. It is on this traffic that the stage line bases its hope for some remuneration.

Another Issue Offered to Employees.—Subscriptions will be received by the Dominion Power & Transmission Company, which controls more than 100 miles of electric railway and supplies light and power to cities of Hamilton, St. Catharines and Brantford, Ontario, for 2,500 shares of 7 per cent cumulative preferred stock. Shareholders and employees will be first to receive opportunity to subscribe, after which a public offering will be made.

Will Redeem Outstanding Bonds.—The Public Service Corporation of New Jersey has elected to redeem on Dec. 1, at 107½ and interest, all its outstanding 20-year secured 7 per cent gold bonds due Dec. 1, 1941. Holders of the bonds are required to present and surrender them with all unmatured coupons attached for redemption and payment on Dec. 1, 1924.

Statistics on New Orleans.—Commissioner Paul H. Maloney of the Department of Public Utilities of New Orleans, La., has given out some interesting figures on the public utilities of that city, based upon the report of the New Orleans Public Service, Inc., recently submitted to him for the year ended Sept. 30. According to Mr. Maloney, the citizens ride the cars 106,673,420 times in a year and use 35,654,436 transfers. The total money invested in utilities in the city of New Orleans is $74,866,386. During a year New Orleans, not including Algiers, pays $7,517,091 for electric railway fares.

Traffic Decreases in St. Louis.—The report of the United Railways, St. Louis, Mo., for the quarter ended Sept. 30 shows a drop of about 4,000,000 passengers for the period compared with the same months in 1923. The total passengers carried in the quarter this year was 63,282,885, against 57,859,171 in the same period of 1923. For the quarter ended June 30 a decrease of 3,856,112 passengers was experienced, making the loss for the past six months more than 8,000,000 compared with the same months in 1923.

Charter Amended for Additional Stock Issue.—Complying with a permit granted recently by the Public Service Commission, the Georgia Railway & Power Company, Atlanta, Ga., will amend its charter so as to issue $2,500,000 of additional 7 per cent cumulative preferred stock. The stock will be redeemable at any time after Jan. 1, 1938, at $115 a share. The present increase will give the Georgia company $15,000,000 in common stock, $10,000,000 in second preferred stock and $6,400,000 in first preferred, making a total capitalization of $31,400,000.

Arkansas Central Stock to Be Offered.—Offering has just been made of 5,000 shares of Arkansas Central Power Company cumulative preferred stock by W. C. Langley & Company, New York, and the Old Colony Trust Company. The stock will be priced at $98 a share to yield 7.14 per cent. The company is the successor to the Little Rock Railway & Electric Company.

Deficit in Net Income.—The Boston Elevated Railway, Boston, Mass., in a return filed with the Massachusetts Department of Public Utilities reveals a deficit in its net income of $786,099 for the nine months ended Sept. 30. An increase in operating expenses and fixed charges is given as the reason. The report shows an increase in passengers carried for the nine months of 4,255,663 over a similar period in 1923, which, however, was not sufficient to offset increased operating expenses and fixed charges. Passengers carried in the nine months totaled 281,088,673 and for the same period this year 285,344,336. The first nine months of 1924, compared with the same period in 1923, shows a loss of $650,004 in operating income and $20,570 in non-operating income. The gross income for the nine months of 1924 was $5,212,357, against $5,882,923 for 1923.

Duluth-Superior Earnings Off.—Net income of the Duluth-Superior Traction Company, Duluth, Minn., for the third quarter of 1924 amounted to $10,061. This is a decrease of 73.84 per cent compared with the net income of $38,453 for the corresponding period of last year. Gross revenues for the quarter were $429,237, a decrease of 8.59 per cent. Operating expenses were $349,393. This is 1.88 per cent below the record for the corresponding period of last year. Net revenue was $79,844. This is a decrease of 29.63 per cent. Fixed charges and taxes were $69,782, a decrease of 6.97 per cent. For the nine months ended with September net income stood at $17,510, which compares with $124,873 for the first nine months of last year.

Algiers Properties Sold.—The liquidators of the Home Bank of Canada have, with the approval of the court and of the inspectors appointed to represent creditors, sold the interests of the bank in the West New Orleans Light & Traction Company and the South New Orleans Light & Traction Company, Algiers, La., to E. W. Burgis, of New Orleans, president and general manager of the companies, for the sum of $800,000 cash. The outlays of the Home Bank of Canada in connection with the railway and light enterprises amounted, with unpaid interest, to approximately $1,150,000 at the date of suspension of the bank.

Additional Offering of Debenture Bonds.—Bonbright & Company, New York, announce an additional offering of $5,000,000 of the American Power & Light Company's gold debenture bonds. The bonds are dated March 1, 1916, and are due March 1, 2016. The price is 94½ and accrued interest, to yield 6.35 per cent. The American Power & Light Company owns practically all the common stocks of companies supplying directly or indirectly 397 communities. The territory served included many important cities such as Portland, Ore.; Wichita, Council Bluffs, Duluth and other cities.

Traffic Decreases.—According to the report submitted to the Public Service Commission, approximately 40,000 fewer fares were collected during September on the lines of the United Railways & Electric Company, Baltimore, Md., than in August. There were also 1,480,158 fewer passengers in September of this year than in September a year ago. For June, July, August and September of the current year 71,890,389 passengers rode the cars, compared with 78,724,396 in the same four months in 1923.

Deficit for Interborough.—The total revenue of the Interborough Rapid Transit Company, New York, N. Y., for the three months ended Sept. 30, 1924, were $13,279,939, an increase of $445,607 over the similar three months of the year previous. The operating expenses, taxes and rentals paid the city for the old subway amounted to $9,201,167, a decrease of $281,153. The income available for all purposes was $3,672,858, an increase of $1,166,589 over the three months ended Sept. 30, 1923. After providing for actual maintenance there was a deficit of $923,184 for the three months period ended Sept. 30, 1924. This figure represents an increase of $936,854 over the balance for the similar three months period ended Sept. 30 a year ago.

Earnings Increase.—According to preliminary figures of the September gross earnings of the Indianapolis Street Railway, Indianapolis, Ind., an increase of 5.48 per cent is shown over gross earnings of September, 1923, while there is an increase of almost 2 per cent over the August earnings of this year. In round figures, there was an increase of $16,000 in earnings over September, 1923, and a gain of $10,000 over last August's receipts. Although the present rate of earnings is not so great as was expected when the company was granted an increase in fares last May, last month's record was by far the most satisfactory, as viewed from the company's standpoint, since the increase in fares became effective.

Municipal Line at Calgary Hard Hit.—The Canadian *Financial Post* says that continued deficits in the operation of the Calgary Municipal Railway, Calgary, Alberta, due to the marked falling off in passenger traffic, is the biggest problem facing Calgary. Administration and overhead expenditures have been reduced almost to a minimum, and the commissioners are now endeavoring to work out some system that will improve the situation. The introduction of buses in some sections is receiving serious consideration. The operation of street cars in the outlying districts of the city, where the passenger traffic is not sufficient to pay for the service, is largely responsible for the present condition.

Power Company Seeks to Purchase Railroad.—The Niagara, Lockport & Ontario Power Company is seeking authority from the Public Service Commission to purchase all of the outstanding capital stock of the Warren & Jamestown Street Railway, which runs between the borough of Warren, Warren County, Pa., and the city of Jamestown, N. Y. The stock is owned by the Venango Public Service Corporation of Pennsylvania. The prospective purchaser says it could furnish motive power to the railroad either directly or through its subsidiary, the Western New York Electric Company, and could effect economies by using existing transmission lines of the railroad for the distribution of electricity for light, heat and power.

Earnings Decrease.—The gross earnings of the railway department of the Cumberland County Power & Light Company, Portland, Me., for the first nine months of the present year showed a decrease of $92,291 over the same nine months in 1923. The operating expenses were $915,613, while for the first nine months of 1923 they were $982,565. This decrease was brought about largely through the reduction of schedules and limitation of shop crews. With interest, rentals and taxes taken into consideration, the department's deficit for the first nine months of this year was $26,331.

Personal Items

Lieut.-Col. J. E. Hutcheson Made Vice-President at Montreal

Lieut.-Col. J. E. Hutcheson, general manager Montreal Tramway and its predecessor, Montreal Street Railway, since 1912, has in addition to that office been elected vice-president of the company. From 1891 to 1912 Col. Hutcheson served with the Ottawa Electric Railway. At the time he joined that company the road was under construction. He served with it in various capacities, finally becoming superintendent. It was this post that he was filling when overtures were made to him from the Montreal company. Mr. Hutcheson entered railroad work in 1876 with the Grand Trunk Railroad as a telegraph operator. In 1884 he became connected with the Canadian Pacific Railroad at Ottawa as train dispatcher. Later he was made trainmaster of the company and continued in that capacity until 1891. He then went to Ottawa. Mr. Hutcheson was born in Brockville, Ont., on Sept. 15, 1858.

B. W. Roberts has been appointed purchasing agent of the Southern New York Railway, Hartwich, N. Y., succeeding Mrs. A. B. Brockway, resigned.

George Tracey has been promoted by the Southern New York Railway, Hartwich, to be superintendent in charge of transportation.

Sir Ernest Clark, Permanent Secretary of Ministry of Finance, and head of the Civil Service of Northern Ireland, will, at the invitation of Lord Ashfield, chairman of the London Underground Railways, join the staff of that group of companies. He is to be attached to the financial side of the undertakings. Sir Ernest has held various important colonial and Irish financial positions with great success.

C. G. Britton has recently been appointed superintendent of the Auburn & Syracuse Electric Railroad, Auburn, N. Y., operating 65 miles of city and interurban railway under the management of Peck, Shannahan & Cherry, Inc. Mr. Britton's first work was in 1903 as a commercial telegrapher. He held various positions in this capacity until 1904. He then entered the railroad field as station operator and later became a train dispatcher on a branch of the Pennsylvania Railroad. In 1906 he became connected with the Annapolis Short Line Railroad, holding positions as train dispatcher, trainmaster and superintendent of transportation until 1921. That year the road was merged with the Washington, Baltimore & Annapolis Electric Railroad, after which he engaged in other business until 1922, when he accepted a position with the Chesapeake Beach Railway as chief dispatcher. He remained with this company until he accepted his present position with the Auburn & Syracuse Electric Railroad.

Samuel A. Wallace, formerly with the London General Omnibus Company, London, England, will be in charge of the new plant of the Public Service Transportation Company at Irvington, N. J., purchased this year for use as a bus maintenance shop where major repairs will be made. The transportation company is the bus operating subsidiary of the Public Service Railway, Newark.

Clark Verner Wood, Jr., is now superintendent of the bus division of the United Electric Railways, Providence, R. I. He has been with the Providence company since March, 1923, in the capacity of assistant to R. R. Anderson, superintendent of transportation. Mr. Wood is the son of Clark V. Wood, president of the Worcester Consolidated Street Railway and the Springfield Street Railway in Massachusetts. Previous to his work with the United Electric Railways, he was for several years in charge of the power-saving departments of the Worcester and the Springfield companies. A brief outline of Mr. Wood's activities appeared in the ELECTRIC RAILWAY JOURNAL, March 24, 1923.

Vincent E. Keenan, superintendent of the bus department, United Electric Railways, Providence, R. I., has left the employ of that company to take charge of the mechanical department of the bus division of the Public Service Railway, Newark, N. J. Mr. Keenan has been connected with the United Electric Railways since April, 1923. For the preceding three years he was on the staff of the Fifth Avenue Coach Company, New York, in the capacity of research engineer, and previous to that time he was in charge of the experimental department of the Locomobile Company of America at Bridgeport, Conn. He was educated at Clason Point Military Academy, Westchester, N. Y., and Cornell University.

Charles W. Ford has resigned as general superintendent of the Kansas City, Clay County & St. Joseph Railway to become district representative of the Yellow Coach Manufacturing Company, with headquarters in Kansas City, Mo. His resignation becomes effective Dec. 1. Mr. Ford has had an experience of 25 years as general superintendent in charge of mechanical and operating details of both transportation and electrical properties. He has been with the Clay County electric line the last 10 years. He is president of the Midwest Electric Railway Association.

R. S. Mahan, claim and general passenger agent of the Kansas City, Clay County & St. Joseph Railway, Kansas City, Mo., has been appointed general superintendent of the company to succeed Charles W. Ford, who has become connected with the Yellow Coach Manufacturing Company. Mr. Mahan has been conected with the railway in an official capacity ever since the company was organized.

Obituary

Dr. Walter Boveri

President of Noted Swiss Manufacturing Concern—Economist and Organizer of Electric Industry

Dr. Walter Boveri, president of the famous firm of Brown, Boveri & Company, died at his home at Baden, Switzerland, on Oct. 28. The immediate cause of his death was a heart lesion which he suffered in September. Doctor Boveri had actually never recovered from an automobile accident which he met with in August, 1922.

Doctor Boveri was a man of charming personality and one who never knew what it was to be confounded by any obstacle. He had many friends in the United States as well as in all the countries of Europe. He was an honorary citizen of the town of Baden and a member of many electrical and scientific societies.

Doctor Boveri acted as president of Brown, Boveri & Company from the inception of the company to his death. He was never a designing engineer. He was best known as an organizer and was a deep student of economics, but he did play a very important part in the development of the mercury-vapor rectifier as applied to electric railways, both tramway and trunk line, now coming into fairly wide use in Germany. He was primarily responsible for the creation of the associated companies with factories at various places in the eight countries and with affiliated sales agencies in virtually every country in the world.

Dr. Walter Boveri

Walter Boveri was born in Bamberg, Bavaria, in 1865, of Italian-Swiss parentage. He attended the industrial school at Nürnberg and after completing his studies there entered the services of the Oerlikon Machine Works, where he was chiefly in charge of installation work. In 1890 he left the Oerlikon works and with the elder Charles Brown, who was chief designer at Oerlikon, started the plant at Baden, which has since developed to be one of the best-known electrical manufacturing concerns in the world. The firm was founded as a purely electrical manufacturing concern with the modest capital of about $120,000. As early as 1892 it added mechanical products to its line.

In 1916 the Federal Technical High School of Zürich bestowed a diploma conferring the degree of doctor of engineering science upon Mr. Boveri "in acknowledgment of his great merits in the development of electricity in general and the Swiss electrical industry in particular."

Henry Procter Waugh, well known in newspaper life in New York for 20 years, died, on Nov. 12, after an operation for cancer of the throat. For many years Mr. Waugh had been publicity director of the Interborough Rapid Transit Company and editor of both the *Interborough Bulletin* and the *New York Railways Magazine*, published in the interest of the employees of those companies. He came to New York 25 years ago from the South, where he had worked on his home town paper in Morristown, Tenn. His newspaper experience also included a period on the *Courier-Journal*. Starting in New York as a reporter on the *World*, he remained with that paper for 12 years, finally becoming assistant city editor. He went with the Interborough in March, 1909. He was 50 years of age.

for Discussion of Manufacturing and Sales Matters

Public Service Will Buy 100 New Buses

The intention of the Public Service Transportation Company, a subsidiary of Public Service Railway, to purchase 100 new buses has just been announced by officials of the company. Conferences have been held between M. R. Boylan, vice-president and general manager of the railway, and representatives of various bus makers. Specifications for the new buses have not yet been made public, but it is understood that the railway wishes to include certain special features in the design. Quick delivery is very much desired.

Tentative permission to proceed with plans to buy the new buses has been given to the operating officials of the railway by Thomas N. McCarter, president. Final approval of the move is expected to be given at the next meeting of the board of directors of the corporation.

The large scale operations of the company in the purchase of existing buses during recent months have placed it in possession of many vehicles of antiquated design. It is the desire to replace these by modern buses at the earliest possible moment. Pending the deliveries of those now being negotiated for, the railway is making efforts to borrow buses from other cities.

New Company to Finance Bus Purchases

The directors of White Motor Company have organized White Motor Securities Corporation to increase facilities for financing time sales of White trucks and buses. The new company will have an authorized capital of $5,000,000. Walter C. White, president of White Motor Company, said heretofore the White Company had financed all of its customers' paper through its own resources without any rediscounting. However, the large increase in purchases by railroads and other transportation as well as a general increase in time sales makes it advisable for White Motor Company to anticipate requirements for additional facilities for financing such sales without impairing working capital. The new company will provide such facilities at the lowest possible cost to customers and will enable the company to take advantage of desirable business.

New York Railways Awards Oil Contract

An important electric railway lubricating contract was closed Nov. 8 when the business of supplying oil for the entire lubricating requirements of the New York Railways was awarded to the Texas Company.

The New York Railways operates 1,593 motor passenger cars over 72.43 miles of route in Greater New York. The contract with the Texas Company does not include oil for use in power stations as the railway purchases its energy from the Interborough Rapid Transit Company. The contract became effective on Nov. 1.

Bids Asked for New Carhouse at Grand Rapids

The Grand Rapids Railway, Grand Rapids, Mich., will rebuild the carhouse destroyed by fire on July 19, 1924, under plans by Williams, Crow & Proctor, Grand Rapids architects. When estimates have been obtained the company will be prepared to proceed with construction.

The new building will consist of two units. One, 16 ft. by 30 ft., will be an office building with two stories and basement. It will have a general office and cashier's office on the first floor, foreman's office and men's quarters on the second and a heating plant in the basement.

The other unit will include the car inspection shop and car washroom, with boiler room and a substation, the larger building being 38 ft. by 224 ft. and the substation 16 ft. by 65 ft. The present substation, 22 ft. by 33 ft., will be used for storage of sand and salt. The car inspection building will cover three tracks. Cars not in need of attention will be stored in the open.

The car inspection building will be one story and of brick construction like the other buildings now in use. It will include space for storage, heating plant, coal for the cars, oils and tool room.

Formation of a Court of Commerce Suggested

Bernard M. Baruch, former head of the War Industries Board, reviewing business conditions and their relationship to government, has suggested the formation of a Court of Commerce, which would decide for business men important questions that might confront them. This court, he said, would differ from the Federal Trade Commission, which he termed an "inquisitorial body," and would appeal to the business man as the Supreme Court does to the lawyer. Mr. Baruch made his suggestion at the Waldorf-Astoria at the fifth annual luncheon reunion of the former members of the War Industries Board.

He said that the country must soon determine what to do with great aggregations of capital. By encouraging them will it be made more difficult for individuals to start a business and cause them to enter the service of these great corporations in order to make a livelihood and career for themselves? He said in part:

> What shall be the attitude of government toward business? During the war we built up great combinations of industry, some of which have remained in the form of associations. These are capable of great good and possibly great harm. A grave question is. Shall the Sherman anti-trust law prevent such great combinations and associations, or shall business be permitted to combine for better production and distribution, thereby cheapening both and resulting in lower prices for the consumer; and if they are permitted to function, what regulatory or supervisory power should be exercised? These combinations, by their mass production, increase the standard of living by placing in the hands of the greatest number of people many of the things which they need.
>
> One of the ideas that we discussed among ourselves was the establishment of a Court of Commerce, before which business men would come with such questions as whether in time of overproduction and low prices they could cut down production and fix a price. If it were possible to establish such a court to say what could and what could not be done, instead of an inquisitorial body like the Federal Trade Commission, would it not appeal as much to the business man as the Supreme Court to the lawyer? Broadly, this court would encourage such practices of co-operation and co-ordination in industry as would be found to be clearly of public benefit, but it should watch against abuses.

Metal, Coal and Material Prices

Metals—New York	Nox. 11, 1924
Copper, electrolytic, cents per lb.	13.625
Copper wire base, cents per lb.	16.25
Lead, cents per lb.	8.65
Zinc, cents per lb.	6.762
Tin, Straits, cents per lb.	54.375
Bituminous Coal f.o.b. Mines	
Smokeless mine run, f.o.b. vessel, Hampton Roads, gross tons	$4.325
Somerset mine run, Boston, net tons	2.175
Pittsburgh mine run, Pittsburgh, net tons.	1.875
Franklin, Ill., screenings, Chicago, net tons	1.375
Central, Ill., screenings, Chicago, net tons	1.275
Kansas screenings, Kansas City, net tons.	2.00
Materials	
Rubber-covered wire, N. Y., No. 14, per 1,000 ft.	$5.25
Weatherproof wire base, N. Y., cents per lb.	17.75
Cement, Chicago net prices, without bags.	2.20
Linseed oil (5-lb. lots), N. Y., per gal.	1.14
White lead, in oil (100-lb. keg), N. Y., cents per lb., carload lots	0.152
Turpentine (bbl. lots), N. Y., per gal.	0.875

Rolling Stock

Brooklyn City Railroad will probably place the order for its new cars, which has previously been referred to in this paper, some time during the week ended Nov. 22. The order will comprise 335 new double-truck four-motor cars very similar in type to the 250 purchased last year. This order will call for an expenditure of more than $5,000,000.

Illinois Central Railroad, Chicago, Ill., it was reported on Nov. 10 was holding up temporarily the matter of the awards for the 250 new multiple-unit cars to be supplied to it for use in its terminal electrification project, but the opinion was expressed that the delay was a matter of only a few days. Specifications for the new cars were sent out early in September. Meanwhile, of course, announcement is delayed with respect to the probable award of contracts for the electrical equipment.

New York, Westchester & Boston Railway, New York, expects that the first of its 10 new all steel cars will be delivered at the Van Nest Shops about Nov. 18. The cars were built by the Pressed Steel Car Company and the first shipment was made on Nov. 5. The new car is 72 ft. 7¼ in. long, weighs 120,000 lb. and has a seating capacity of 80. The cars are equipped for multiple-unit operation at high speed. Dimensions and details of the equipment follow:

Type of car	Vestibuled Passenger
Weight:	
Car body	77,500 lb.
Motor truck	16,620 lb.
Trailer truck	12,580 lb.
Equipment	13,300 lb.
Total	120,000 lb.
Bolster centers, length	47 ft. 7½ in.
Length over all	72 ft. 7¼ in.
Truck wheelbase	8 ft. 0 in.
Width over all	10 ft. 4 in.
Height, rail to trolley base	14 ft., 5 in.
Body	All steel
Interior trim	Agasote
Headlining	Agasote
Roof	Arch
Air brakes	Westinghouse
Armature bearings	Bronze
Axles	Standard Steel Works
Buffers	Pullman
Car signal system	Westinghouse conductor's whistle
Car trimmings	James L. Howard & Co.
Center and side bearings	Perry
Conduits and junction boxes	Westinghouse
Control	Westinghouse
Curtain fixtures	Morton Manufacturing Co.
Curtain material	Fabrikoid
Destination signs	Ellcon
Door-operating mechanism	National Pneumatic
Draft gear	Pitt-Forsyth
Gears and pinions	Nuttall BP pinion and flexible gear
Hand brakes	Blackall
Heater equipment	Gold
Headlights	Golden Glow
Journal bearings	Bronze
Journal boxes	Symington—5½ in. x 10 in.
Motors	Westinghouse 409-B, inside hung
Paint	Veluvine enamel
Sash fixtures	O. M. Edwards
Seats	Heywood-Wakefield
Seating material	Pantasote
Slack adjuster	Westinghouse Type L
Springs	Semi-elliptic
Step treads	Kass safety
Pantograph	Nuttall U. S. No. 131
Pantograph shoe	No. 14 gage steel
Trucks	Pressed Steel Car Company
Ventilators	Garland
Wheels:	
Motor truck	42-in. steel tired
Trailer truck	36-in. rolled steel

Grand Rapids Railway, Grand Rapids, Mich., plans to conduct a comparative test this winter of light-weight noiseless electric street cars, St. Louis and Brill cars. Last July the company lost 65 cars by fire, and since then has been reported to be in the market for 30 cars of the one-man, two-man type.

South Carolina Gas & Electric Company, Spartanburg, S. C., has received the first of the four new buses recently ordered by it for operation in the city supplementary to the street car lines. The vehicle has a seating capacity of 22 persons. It is of Dodge-Graham make. Three more vehicles of the same size and type are expected soon.

Track and Line

Spokane United Railways, Spokane, Wash., has been doing repair work on Sprague Avenue and on the Rockwood line. New ties have been put in, curves have been rebuilt and broken rails cut out. At Hamilton and Baldwin Streets new frogs have been installed and the track structure has been rebuilt.

Milwaukee Electric Railway & Light Company, Milwaukee, Wis., has completed the construction of the eight-block extension of the Center Street line bridging the gap between Twenty-seventh Street and Thirty-fifth Street. The extension required an expenditure of approximately $100,000. It covers 2,700 ft. of trackage, 2,440 ft. of double track and 260 ft. of single track, the latter to be double tracked when grade crossing improvements are under way by the railroad which crosses this line.

Key System Transit Company, Oakland, Cal., has started reconstructing track and laying permanent pavement on West Twelfth Street at a cost of $103,000. The extension of the Lakeshore line on Walla Vista Avenue a distance of 1,787 ft. east will cost $25,000.

Stockton Electric Railroad, Stockton, Cal., will build a half mile double track extension to the College of the Pacific. General Manager Webster has secured an appropriation of $40,000 for the extension and work will start as soon as rights of way are secured and the franchise granted by the City Council.

Coral Gables Utilities Company, Miami, Fla., has been granted a 25-year franchise to build and operate a railway. Work on the new line, which will be approximately 3½ miles long, is to be started immediately. The estimated cost is $150,000. The downtown and city portion of the line will operate over municipal tracks and over tracks owned by the Coral Gables Utilities Company for the remainder of the distance. It is said that an arrangement has been made with the Florida Power & Light Company, lessee of the municipal traction line for using the tracks and furnishing power.

Dallas Railway, Dallas, Tex., celebrated recently the opening of the Southwest Oak Cliff route and the completion of the Hampton Place car line, an extension of about 2 miles from Tyler Street and Jefferson Avenue in Dallas, Tex. The extension has been completed at a cost of $136,000, a portion of which was borne by the Dallas Railway and the remainder by the Moss-Tate Investment Company.

Trade Notes

Heine Boiler Company, Inc., St. Louis, Mo., announces that R. C. Broach, formerly in the general sales department at St. Louis, has been appointed its southeastern district manager, with offices in the Glenn Building, Atlanta, Ga. S. B. Alexander will continue as special representative in North and South Carolina.

Gibb Instrument Company, Bay City, Mich., manufacturers of electric welding and electric heating equipment, announces the appointment of H. V. Beronius to represent it in Iowa, Kansas, Nebraska, Oklahoma and northwestern Missouri. His headquarters will be 33 Linwood Terrace, Kansas City, Mo.

Fuller-Lehigh Company, New York, N. Y., has entered into an agreement with Babcock & Wilcox, Ltd., of London, to operate under the Fuller-Lehigh Company patents, whereby everything in connection with its pulverized coal business will be handled in the various countries throughout the world by Babcock & Wilcox, Ltd., of London, with the exception of the United States, its dependencies, Canada and Mexico. Babcock & Wilcox, Ltd., has taken over a large number of the members of the Fuller organization who have specialized for years in work of this kind.

Globe Electric Supply Company, Denver, Col., has been appointed district representative for the Kuhlman Electric Company of Bay City, Mich. The territory involved includes the states of Wyoming, Colorado and New Mexico. The Kuhlman company expects to have a stock of transformers placed shortly with this new representative.

Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., will complete about Dec. 1 the $2,000,000 annex to its plant at Lester, Pa. The new plant, now partly in operation, is known as the turbine blading shop. Work upon the structure was begun last spring. Two buildings of steel, hollow tile and concrete and covering more than a city block are included in the new unit.

New Advertising Literature

Rail Welding & Bonding Company, Cleveland, Ohio, has issued Bulletin No. 112, covering Una Rod 300. The bulletin states "Una Rod 300 welds as easily as a low carbon steel and deposits a pad of clean high carbon metal as hard as the rail."

Triumph Electric Company, Cincinnati, Ohio, has issued a bulletin on the TR self-start motor.

Walter A. Zelnicker Supply Company, St. Louis, Mo., has issued Bulletin No. 329, listing information on locomotive equipment, rail material and power plant and contractors' machinery.

General Electric Company, Schenectady, N. Y., has issued a 27-page bulletin, designated as No. 47731, on automatic station control equipment. It describes briefly the uses and advantages of this type of equipment and is well illustrated.

Chicago Mayor Persists in M. O. Discussion

FROM the results of the recent national election it is evident that the people of the nation do not want public ownership of railroads. That decision seems to have been most emphatically expressed. In Chicago, however, the Mayor is still endeavoring to work out a plan for municipalization of the surface and elevated properties. Direct negotiations for the purchase of these lines having apparently failed, Mr. Blair, president of the surface lines, has proposed the consolidation of surface and elevated lines into a comprehensive one-city, one-fare, transportation system under some form of service-at-cost franchise. Mr. Insull, chairman of the elevated lines, has offered to finance $23,000,000 of rapid transit extensions if the city will say "go." The Mayor continues to favor municipal ownership as the first consideration in working out a plan for improvement of transportation facilities.

It is reported that he is carefully waiting for an opportunity of splitting off some one part of the local transportation system to be used as a club to force more favorable terms from the security holders of the remainder, under the threat of extending a competitive city-owned system. Such a plan would correspond generally with the method used in Detroit to force the sale of the D. U. R. city lines to that city. While considering Detroit methods, it might be well for Chicago's Mayor to analyze carefully the results accomplished there by municipal ownership. Even granting that its municipal system has been successfully kept largely out of politics to date, what advantage has municipal ownership brought to the car riders? It is hard to find one. In fact, such success as has accompanied municipal operation is directly attributable to Detroit's wisdom in turning its system over to operating men who obtained their training and experience in private enterprise. The threat of future political interference is constantly present and is even more aggravated by the result of the recent election in that city.

It is generally considered that Chicago's Mayor is sincere in his views on municipal ownership. In that respect at least the present administration, from the standpoint of the car rider, is a vast improvement over the one that preceded it. He has, however, shown evidence of being so absorbed in the hobby of municipal ownership as to put acquirement of the lines by the city first, and speedy improvement of the transportation facilities second.

The City Council committee on local transportation is endeavoring to work out a plan for submission to the voters in a few months. If that is done, it is to be hoped that the people of the city will again express their opinion of public ownership as decidedly as was done in the national election. Thus the way will be cleared for the speedy adoption of a policy that will permit extension and improvement, just as business in general is responding after the burial of the government ownership bugaboo in national affairs.

Standardization of Contact Line Should Further Electrification

ONE of the most important things in facilitating progress in the electrification of American trunk-line railroads is the adoption of a common system of current supply. Rightly or wrongly, the attitude of the railroads has consistently been that interchangeability of motive power is essential if electrification is to be extended beyond installations where it has been adopted locally for particular reasons. With standardization of supply, say at 11,000 or 22,000 volts, the steam roads can purchase equipment with the knowledge that it can be used on more than a single division of a single railway.

Details of the locomotives to be operated on the various roads naturally will differ with the service requirements, depending on the physical features and the character of the traffic. So do steam locomotives differ. But the feature mentioned most often by steam railroad men is that any standard-gage steam locomotive can be operated anywhere in emergency, and while it may not be particularly well adapted to the load, it can function so as to handle a certain amount of business. For instance, during the shopmen's strike two years ago many roads used freight engines for hauling passenger trains and vice versa. Certainly it was better to get the trains over the road late than not to move them at all.

Leading railroad men and consulting engineers have felt for some time that the highest contact line voltage is none too high, if trainloads are to continue to increase in the future as they have in the past. The New York, New Haven & Hartford Railroad was the pioneer in high-tension distribution, having adopted a single-phase contact line at 11,000 volts nearly 20 years ago. On its system have been operated electric locomotives of nearly every type ever proposed for alternating current. While it is usually admitted that direct-current motors have advantages from an operating and maintenance standpoint, these advantages are not so great as to overbalance the ability to distribute large quantities of electrical energy economically by means of high tension. The latest types of a.c. locomotives employ d.c. motors with the aid of conversion equipment on the locomotive itself.

With greater and greater concentration of train weights and increase in propulsion power, the load factors have become correspondingly poorer. On a large system this can be compensated for to a great extent by increasing the distance served by a single substation as much as possible, which in turn demands high voltage to cut down the distribution loss. As an example, consider the supply of 20,000 hp. to one train, the amount mentioned as the input for the Virginian electrification. At 22,000 volts a.c. this would require some 900 amp. and at 11,000 volts 1,800 amp. With 3,000 volts d.c., even making allowance for the advantage of power factor, some 5,400 amp. would be needed, or three times as much. At 600 volts d.c. the delivery of this power would require 27,000 amp. Low voltage d.c. is clearly out of the question. Even at 3,000 volts such amounts of current have been collected only as an experiment. On the contrary, collection of the smaller currents for the high-tension systems is not difficult. The advantage in less distribution copper and the ability to space substations farther apart is obvious, as the copper loss varies inversely as the square of the voltage.

The decision of Henry Ford to use 22,000 volts on his road need occasion no concern. In case the demand for very heavy motive power continues this move is entirely logical. The main problem is insulation on the locomotive. Supposing that 11,000 volts is adapted as a standard, interchangeability need not be affected at all, as the same engines can be used on both systems by designing the transformer primaries for connection in series and in parallel, which can be effected almost instantly by a change-over switch under the control of the engineer.

With standardization on a contact line of 11,000 or 22,000 volts alternating current, there seems no reason why the last of the technical difficulties that for so long have stood in the way of a comprehensive electrification of the trunk lines of this country should not be brushed away. The roads can then proceed with confidence, and the problem can be worked out on economic grounds, so that the lines that should be equipped electrically, either to increase capacity or to give an operating economy, can be converted without delay.

The Majority of Shoppers Travel on Trolley Cars

A RECENT check made at 13 leading stores in New York City during a busy shopping hour showed that out of 35,252 customers only 813 came by automobile or taxicab. The others came by street car or subway, by bus or on foot.

In these days of the intensive use of the streets, the tendency will become more and more definite to apply the Darwinian theory of the survival of the fittest to determine what street users to favor, as there is not going to be room for every one. The first street users to go are those who want to use busy highways for storage purposes by parking their cars while they go shopping or are on some other business. Such users have the least excuse for street space, and anti-parking laws are being passed to take care of them.

In some cities the next line of attack will be against the car lines in certain busy streets. Indeed, such an attack has been begun. Mayor Hylan has already said that Forty-second Street and 125th Street, among others in New York, should be cleared of car tracks, and there have been suggestions in Los Angeles and other cities that more automobile traffic could be moved through certain busy retail streets, if the car lines were removed.

It is not surprising that such a plan appeals at first thought to the automobile owner. To him every other user of the street is an obstruction in his path. To those who have a real interest in ascertaining the facts, like the retail merchants, the situation is quite different, and it is not surprising that in both New York and Los Angeles, the storekeepers on the streets affected protested against any proposal to abolish car lines. In New York the protest would have been much louder if the suggestion had been taken seriously, but as it emanated from Mayor Hylan it was looked upon only as a part of his plan to pester "the interests."

In any contest in which a railway may be engaged over its right to serve the public, such evidence as the above should make the discriminating local merchants its strongest supporters. They are the first to feel the effect of any diminution in service of the local transportation system, and should realize that the great majority of their customers must reach their stores by trolley.

What Causes Traffic Congestion and How to Relieve It

PROBABLY no phase of the work done during the past year by the Transportation & Traffic Association is more important than that dealing with street congestion. This cannot well be denied when vehicular congestion is causing a reduction in speed from an average of 10 or 12 m.p.h. in the suburbs to somewhere between 1 and 4 m.p.h. in congested streets during the rush hours, as was brought out during a meeting at the recent convention.

Three major causes of congestion mentioned there are first, the concentration of large business population within a small area, a situation resulting from the development of the steel frame building; second, the increasing number of private vehicles on the streets, and third, automobile parking.

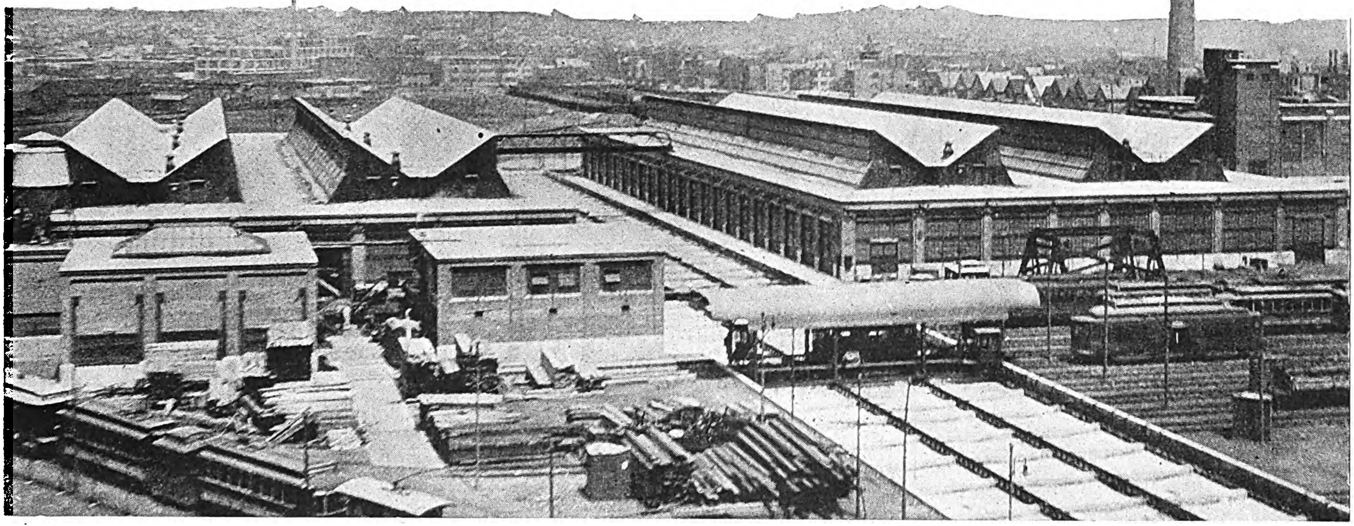
Suggested remedies fall into two groups. The first consists of methods to increase the area available for traffic, i.e., street widening, etc., and the second of ways to increase the usefulness of the existing traffic area. The first group the committee finds unsatisfactory because of the likelihood that the increased area will immediately attract increased traffic in sufficient amount to nullify any advantage.

In the second group of proposed remedies the elimination of auto parking, especially during the rush hours, is the most important. To accomplish anything along this line it will be necessary to secure the co-operation of the general public. How best to do this is quite another thing.

A committee studying this subject has recommended the appointment of a permanent committee. Good results are likely to come by such a step. Here is a problem that affects vitally not only every railway, but every street car rider, every automobile or truck driver, every merchant, every property owner—in fact, every resident of every city worthy of the name. The problem is all the more difficult because it is so widespread, each person having more or less well defined opinions on the subject. The thing to do is to keep at it, to try out as many plans as seem to have any merit and to study the results carefully. Progress in the relief of traffic congestion has been made in some cities, and in ways that will apply to the rest of the country. By collecting and disseminating information as to how this is being done, undoubtedly a better understanding of the problem will result, and real congestion relief will be obtained.

Everett Shops of Boston "L" Pave Way to Maintenance Economies

First Article



The New Shops of the Boston Elevated Railway Occupy a 22½-Acre Site Adjacent to the Everett Terminal of the Elevated Line

The New Layout, Which Provides for All Equipment Repairs Except for the Cambridge Subway, Was Decided On After Careful Survey of Requirements—Growth of the System Dictated Concentration of Facilities for Rolling Stock Maintenance—Comprehensive Provision for Mechanical and Electrical Services

STRATEGICALLY located to reduce dead mileage to the minimum, designed to meet the increasing demands of rolling stock maintenance on this transit system for years to come and finely equipped with woodworking and paint shop machinery and individually motorized tools, the Everett shops of the Boston Elevated Railway mark a distinct advance in traction repair facilities and point the way toward substantial economies in administration. Preliminary drawings of these shops were published in this paper March 19, 1921, and in the issue of Feb. 10, 1923, a general description was given of the layout of the buildings and the proposed routing of the work. Thus far the company has built only the paint shop, lumber storage, dry kiln, boiler house and wood shop, with related yard facilities as mentioned in the latter article. The steel-working shops or general machine shops have not yet been begun, as appropriations for these have not been available. Consequently there has been no opportunity as yet to secure the full economies anticipated from the ultimate layout, but on the woodworking and painting sides of rolling stock maintenance material gains in convenience have already been attained.

NEED FOR INCREASED FACILITIES RECOGNIZED EARLY

For many years the company has needed proper shop facilities for taking care of rolling stock maintenance, though large investments have been made for new and improved cars, heavier tracks and for power generation and transmission equipment. Many of the shop facilities used up to the occupation of the new shops were relics of the horse car days. The principal shop was located at Bartlett and Washington Streets, Roxbury, in an old horse car barn, which after electrification was converted into a car repair shop by making such improvements as were possible without a general remodeling. The greater part of the surface car repairs, except work on trucks and motors, was done there.

This arrangement worked fairly well for a while, but as the number and the size of the electric cars increased, this shop became more and more inadequate and inefficient. While there was considerable land available at the Bartlett Street site, there were no railroad facilities, so that expansion at this point was deemed inadvisable. Another shop which was in use for many years was a remodeled building on Albany Street, 1¾ miles away, and also without railroad facilities, which was purchased in 1889 as part of a site for the electric railway power station, and which was remodeled as a truck and blacksmith shop. The upper floors of this building were destroyed by fire in 1912, and an adjoining building was leased to provide additional space for the machine shop.

As the amount of rolling stock continued to grow it became necessary to handle at the individual carhouses much of the heavier maintenance as well as some painting. Then, too, a considerable area of the Bartlett Street shops became unusable since the transferway, elevators and track clearances were too small to permit the movement of the larger cars. By cutting notches in the columns some of the cars could be handled, but without sufficient room between tracks for good work. There was no space for lumber storage near the mill room, and frequently lumber had to be handled 200 ft. to be finished.

Beginning with rapid transit service in 1901, it was necessary to provide shops for the elevated cars. The first shop was built at Sullivan Square, all the work being done there except for the inspection and cleaning done at first in a small shop at Guild Street, adjoining the Bartlett Street surface car shop, and later in an inspection yard and shop at Forest Hills. With the construction of the Everett extension the inadequacy of repair facilities for the elevated was aggravated, since the construction of the main line tracks necessitated the removal of a portion of the shop.

The Cambridge subway was constructed independently of the remainder of the rapid transit system, and the cars are so large that they cannot be operated over the remainder of the tracks. Accordingly a modern inspection and repair shop was built at Eliot Square, Cambridge, adequate to provide for this division and for the East Boston tunnel cars. An inspection loop is also planned in connection with the electrification of the Shawmut branch of the New Haven Railroad which will be operated under lease as a part of the Dorchester tunnel extension.

Layout of Heating Mains for Buildings Already Constructed

For a number of years the company has been investigating the selection of a proper site for repair shops. The primary needs were felt to be accessibility to both surface and rapid transit lines and proper steam railroad and water transportation facilities. Such a site was chosen on a 22½-acre plot adjoining the Everett terminal of the rapid transit and surface lines. This site borders on the Mystic River and is within a 15-minute ride of the center of Boston.

Owing to the unsatisfactory conditions at Bartlett Street, particularly lack of room for car painting, it was decided that the first unit at Everett should replace those facilities. This unit, work on which began a year and a half ago, consists of a woodworking shop, paint shop, lumber building and dry kiln, with transferway and track connections to elevated and surface lines. There also are freight sidings and a connection to the steam railroad. In the first unit are also included the permanent heating plant and necessary electrical equipment common to the entire project. This first unit was put into partial operation in December, 1923.

19. Oil house.
20. Boiler house.

The mechanical and electrical service supply of these shops centers in a combined steam boiler plant and substation located on the Broadway, Everett, side of the property. This plant is a brick and steel structure 84 ft. x 79 ft. 6 in. and containing one story and a basement. The ground floor is divided into a boiler room and an electrical operating room, the basement being occupied by ash-handling facilities and by low-tension electrical control equipment. The electrical bay on the operating floor extends the entire length of the building and is 29 ft. wide. A spur track connects the company's system with the north side of the boiler house for the convenient handling of fuel, ashes and equipment.

The exposed location of these shops on an open plain in the lower valley of the Mystic River and the extent of the ultimate installation of shops led to the selection of water-tube boilers fired by mechanical stokers for the steam heating plant. The paint shop and wood mill are of concrete, brick and steel construction, with butterfly roofs. The paint shop is 362 ft. 4 in. long x 172 ft. 4 in. wide, the wood mill being of the same length and 157 ft. 4 in. wide. There is space in the boiler house for four boilers set in two batteries in a single row, but the present installation consists of two 369-hp. cross-drum type Babcock & Wilcox units equipped with Taylor stokers and burning bituminous coal. B. & W. superheaters raise the steam 50 deg. F. above saturation temperature. The boilers are designed for 160 lb. pressure, but about 125 lb. will be used for the present.

Two turbo-driven Sturtevant forced-draft fans are

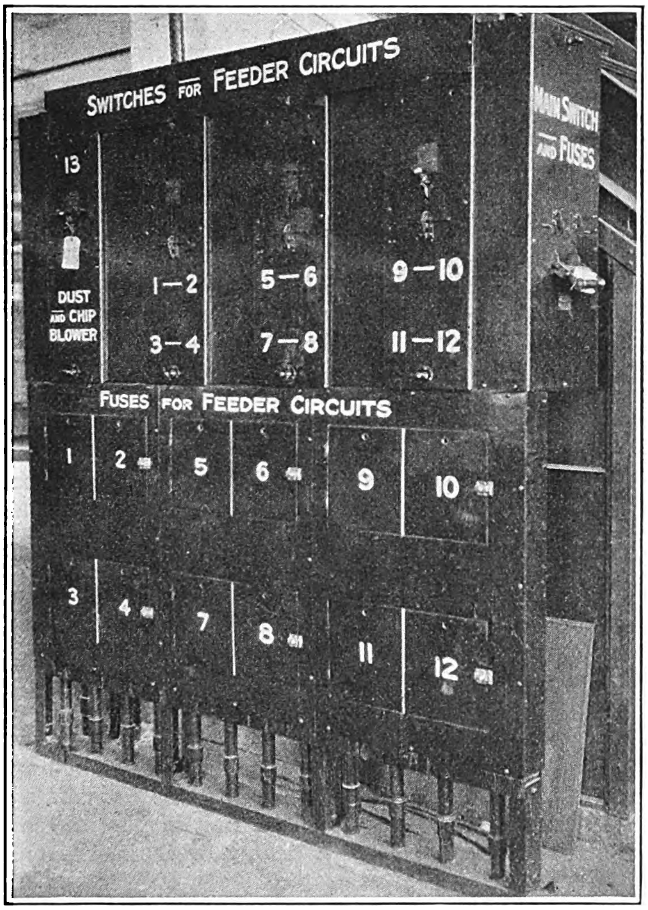
Schematic Wiring Diagram for Power House, Including Provision for Future Additions installed on the operating floor of the boiler room to supply air to the furnaces. The boilers are equipped with concrete ash hoppers fitted with rolling gates. Ashes are discharged by gravity from the hoppers into an ash car and trackage system in the basement which connects with an automatic skip hoist on the outer side of the building. By pressing a button this hoist elevates the ashes above the boiler houses and discharges them into a 10-ton overhead hopper from which gravity delivery is made into cars on the spur track.

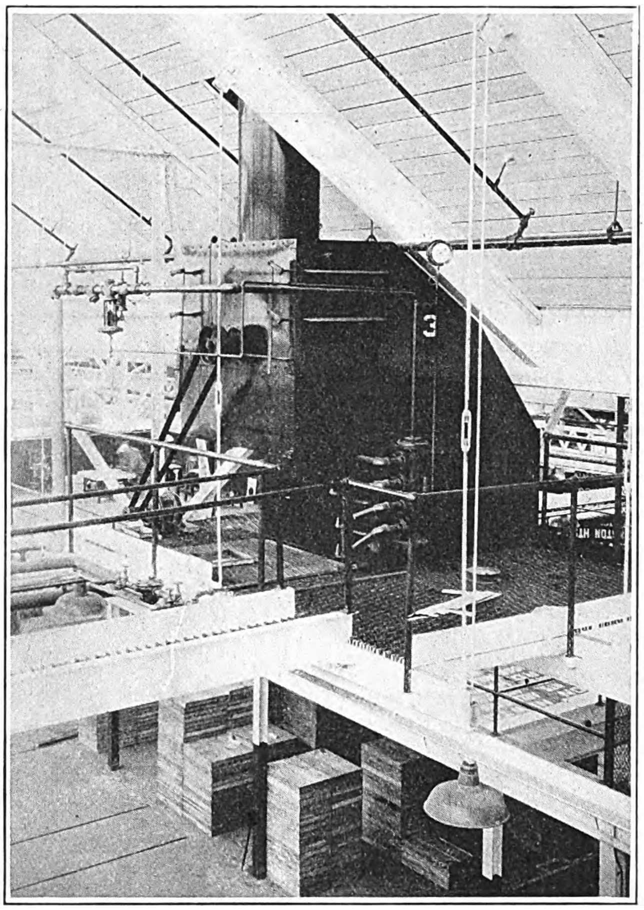
Coal crushed at the company's main generating station is brought to the boiler house in company cars and is dumped into a track hopper under the ash chute, so that when desired the same car can be used to deliver coal and remove ashes. From the track hopper the coal is carried by a belt conveyor to an elevated tower which forms part of a 200-ton storage bunker at one end of the boiler room, whence it is delivered to the stoker hoppers by a motor-driven lorry of the weighing type. The coal and ash handling machinery was installed by the Underwood Machinery Company, Boston.



Switchboard for Feeder Circuits, with Fuses Inclosed in Cabinets Beneath

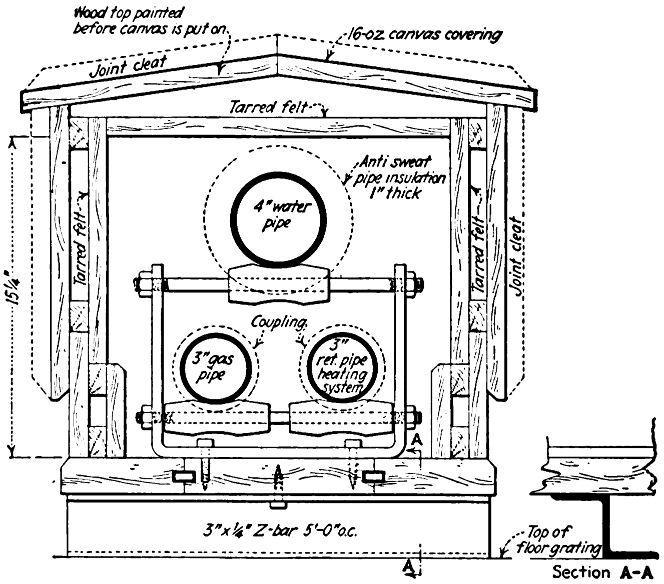
Two Lee-Courtney two-stage turbo-driven feed pumps constitute the major equipment of this type, but to obtain more economical operation at times of light load on the heating system a Union Iron Works reciprocating pump capable of supplying feed water to one boiler has been installed.

Electrical energy is being supplied temporarily to these shops by the Malden Electric Company, but the installation is designed so that in the near future it will come from the main generating plant of the Boston Elevated Railway. Energy will enter the substation at 13,200 volts, 25 cycles. Two No. 0000 three-phase underground feeders will serve the initial installation, with space provided for a third. These cables enter the substation basement and pass through disconnecting switches, current transformers and General Electric FH-103 500-amp. oil switches and further disconnects to a high-tension bus structure in this room. From the high-tension bus, cable connection is made through similar oil switches on the operating floor to starting compensators and switches controlling two General Electric synchronous frequency converters located in the operating room and designed to transform the 25-cycle, 13,200-volt energy into 60-cycle, 550-volt, three-phase energy for local distribution. One converter is rated at 500 kw. and the other at 750 kw., space being provided for a third unit of the larger rating. Two 34-kw. direct-connected exciters, with room for a third of the same size, are included.



The Ventilating Fan in the Wood Mill Is Installed on a Gallery

From the generators of the frequency converters connection is made to a 550-volt, 60-cycle, three-phase bus located in the basement, whence feeders are run to the various shops. The switchboard controlling the various equipment, including frequency converters and feeders, is located in the operating room and is of the remote-control type. An "E-9" Exide storage battery of 55 cells supplies direct current for oil switch operation and emergency lighting through an automatic switch installation. The battery is charged from a small motor-generator set in the substation. Space has been assigned in the operating room for a motor-driven air-compressor, but at present air is secured

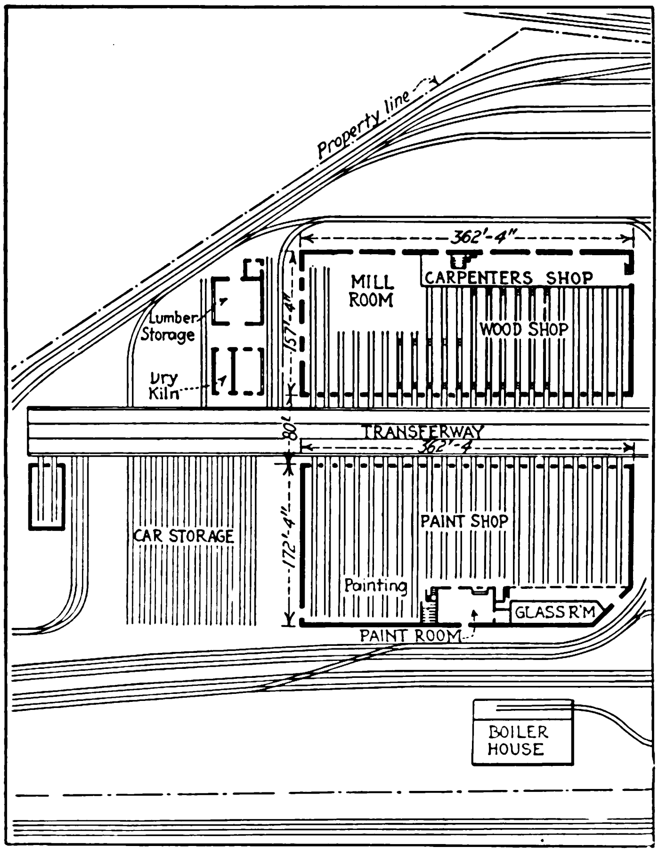


The Piping Is Carried Over the Transferway on a Bridge in an Inclosure

from the company's pipe line system. An Underwriters' fire pump of 1,000-gal.-per-minute capacity is installed, with space for a second unit. The substation is served by a 20-ton Whiting electric crane.

In general the paint shop and wood mill are heated by hot blast fans which force the air across steam coils and discharge it through outlets into the room below at the rate of 1,000 cu.ft. per minute per fan unit. In each of these buildings eight fan and heater coil units are installed. Steam is carried to the paint shop by an underground 10-in. line, with a 4-in. continuation to the wood mill. The latter pipe is carried in an insulated inclosure across a bridge clearing the transferway between the paint shop and the mill. Reducing valves are installed on the supply side of each set of heating coils.

The heaters operate on from 30 to 35 lb. steam pressure. In certain inclosed spaces such as offices and lavatories direct radiation supplements the fan system. The heater units are mounted on the skylight sections to leave the supply of natural light as free as possible. The air in this system can easily be recirculated and fresh air can be introduced freely from outside the shops. The heaters are of the Sturtevant inverted type, 8 ft. 3 in. high x 7 ft. wide, each unit having four discharge outlets at the bottom of the casing and located 18 ft. 6 in. above the floor. The heaters are supported by steel members spanning the space between roof trusses and also by hangers attached to the roof girders. A steel platform around each heater makes inspection and repair work easier. The fans are all motor-driven. A 6-in. return line brings the drips from the heating system to the boiler house for recirculation in the feed water system.



Layout of Wood Mill and Paint Shop, the First Units of the Everett Shop to Be Completed

The lumber storage building, two stories high and about 55 ft. x 52 ft., is served by a 3½-in. steam line. The second floor is divided into a series of warm rooms arranged in tiers along two sides of the building with an open space between. In each one of six rooms two sets of heating coils are installed. Each set of coils consists of 168 linear feet of 1¼-in. pipe, affording 72 sq.ft. of heating surface per set, and each set is served by a 1-in. live steam lead and has a ¾-in. return lead to the drip piping.

The dry kiln is heated by the direct two-pipe steam vacuum system. The heating unit is sufficient to build up and maintain a temperature of 150 deg. F. in the kiln while changing the air five times per minute. The fan installation has been made in connection with supply ducts leading from the fan discharge down the center of two trucks of lumber which are run into the kiln loaded on tracks at right angles to the transferway. The return ducts are along the sides of the kiln. A humidifying system provides for the entry of live steam sprays between the heating unit and the fan intake. There are also two lines of pipe extending under each line of tracks so that the lumber may be steamed before beginning the drying process. Various instruments used in testing the moisture content of the lumber, temperature and humidity are installed, with an electrically controlled charging oven for use in studying moisture present in small samples of lumber.

The standard pipe coloring schedule approved by the American Society of Mechanical Engineers is followed in these shops.

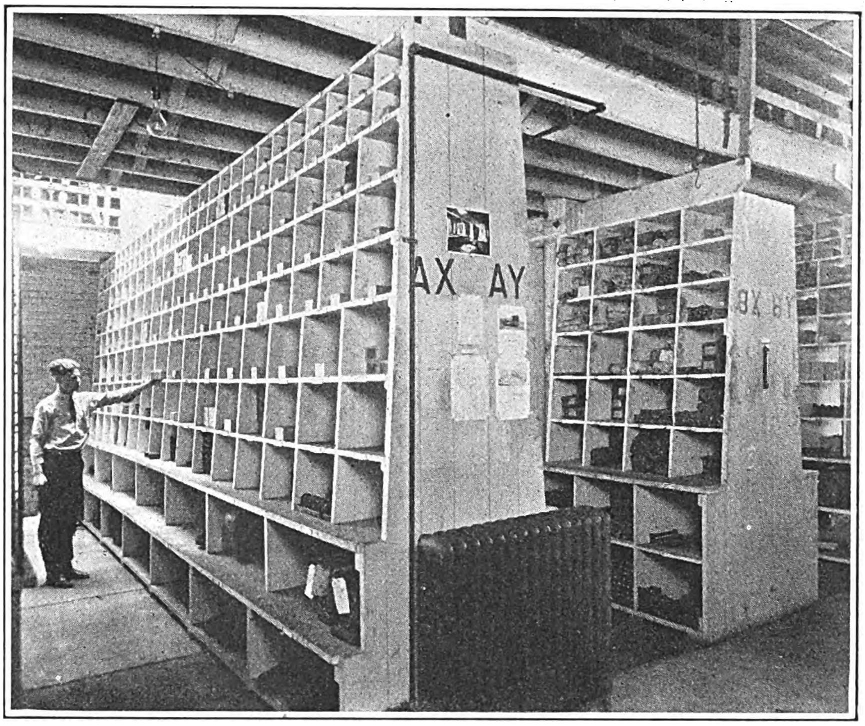
Atlanta Buys Steam from Incinerator

THE Georgia Railway & Power Company has just agreed to buy the excess steam of the garbage and refuse incineration plant in Augusta. It is expected that during the winter months the steam thus bought will be used in the commercial steam-heating system of the company and during the summer months it will be used in the commercial gas plant of the company. The contract is for ten years and provides that the city shall supply 80,000,000 lb. of steam a year, with a set minimum average per day and per hour at 170 lb. pressure.

Storeroom Improvements at Richmond Save Time and Money

Stock Has Been Completely Rearranged and New Cases Provided —Heavy Material Is Kept on Raised Platforms—Lift Trucks Save Much Time—Cost of Installing New System Was $5,400

By John Y. Bayliss
Director of Purchases and Supplies Virginia Railway & Power Company
Richmond, Va.



Material Is Piled in These Cases so It Can Be Counted Without Handling. The Stock in the Two Cases Here Shown Can Be Counted in 40 Minutes. Gas Steam Radiators Are Used for Heating the Storeroom.

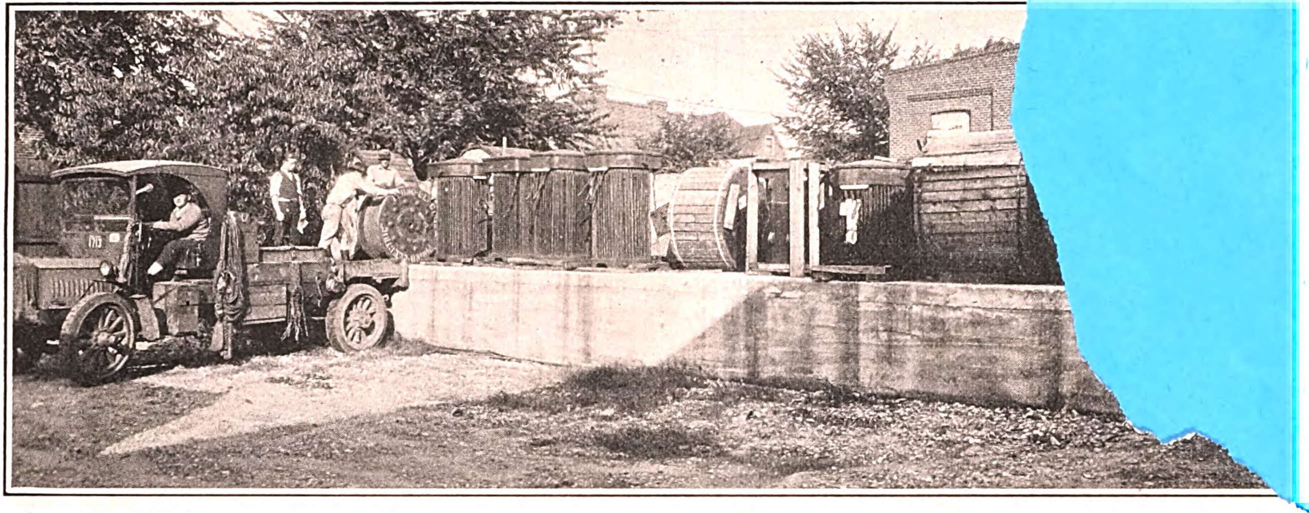
AFTER careful consideration of various methods of providing and conserving materials and supplies for current use, the Virginia Railway & Power Company has adopted the so-called stock-book system, and has installed it in one of its large storerooms. The installation involved not only changes in making and keeping the record of stock, but also a complete rearrangement of the stock itself.

The stock-book form is printed with columns for the usual descriptive information about each article and has also space for recording the amount of each article in stock for each month of the year. Each sheet holds the record for four years. The system depends upon a complete inventory once a month, so that requisitions can be made with definite knowledge of the amount of each article on hand. To make possible such an inventory with reasonable expense, the stock must be visible on the shelves and must be stored in such shape that to a large extent it can be counted without handling. Although annual inventory has always loomed as an ominous cloud on the storekeeper's horizon, the monthly inventory can be made in a comparatively short space of time and without extra help. Paradoxically, what was a great bugaboo once a year, now that it comes once a month scarcely makes a ripple on the smooth surface of the affairs of the storeroom.

The Richmond storeroom contains supplies for both railway and light-and-power service. For convenience in arranging the stock and keeping the records, the materials have been classified according to use and physical characteristics. There are 77 classes of material in this storeroom. The material is listed in the stock book and placed on the shelves and floors in comformity to this classification.

The typical material case is made of dressed lumber and is 22 ft. long and 10 ft. high. It is 4 ft. 4 in. wide at the base and 2 ft. wide at the top. At a height of 3 ft. from the floor there is a shelf 8 in. wide on which the men stand to reach the bins at the top. The case is divided equally by a galvanized wire partition of ¾-in. mesh and No. 14 gage running lengthwise and from top to bottom through the middle. From this the shelves open on both sides. Such a design admits plenty of light and makes it possible to see through the shelves from one side to the other. The case is painted white inside and out with two coats, the last coat being enamel for a hard, glossy finish.

Each bin or pocket has a small galvanized metal card holder, on the front in which is inserted the number and description of the contents. The cases are separated by aisles 3½ ft. wide. Experience has proved the aisles should be not less than 4 ft., or better still 4½ ft., in width if the space is available. As far as practicable, the materials are piled in multiple units to facilitate counting and handling. Small articles are put up in packages containing the amount usually issued on requisition. The articles are packed thus by the makers, if the material in that form can be purchased economically. If that cannot be done, packages are put up by the storeroom clerks when they are not otherwise engaged. This method has advantages over the unit-piling system, because it not only facilitates the inventory, but also aids the issuing of the material.



Concrete Platform for Storing Heavy Reels of Cable and Large Transformers. Two-Ton Reels and Large Transformers Can Be Easil and Quickly Loaded and Unloaded from This Platform

A section of the storeroom has been set aside for receiving and checking material delivered. It is inclosed by a partition, the lower part of which is of wood and the upper part of wire-mesh screen. It can be locked off from the remainder of the storeroom. Here deliveries are received and inspected before the material is placed in stock. Such a section adds to the orderly operation of stock receiving and prevents premature issues of materials that have not been accepted and accounted for. A locker section also is provided for articles in suspense, such as goods rejected, incorrectly shipped, or not identified by proper shipping papers.

Another section has been built for issuing materials on requisition. It consists of a wooden counter surmounted by a wire-mesh partition. The man with a requisition presents it at this counter and the clerk brings him the material required. There is a gate with a latch which can be opened to pass out bulky articles not easily issued over the counter. The tendency for men from other departments to enter or pass through the storeroom, either on business or otherwise, is thus prevented.

Special cases have been built for storing pole-line hardware, gear wheels, glass, sheet metal, tubing, etc. Such articles, being bulky or inconvenient for shelf storage, heretofore were piled on the floor, resulting in wasteful use of floor space and improper protection of the property. Putting the material in cases saves storage space, makes it more accessible, and presents withal such an improvement in the appearance that even the men who handle the stock have more respect for its importance and value.

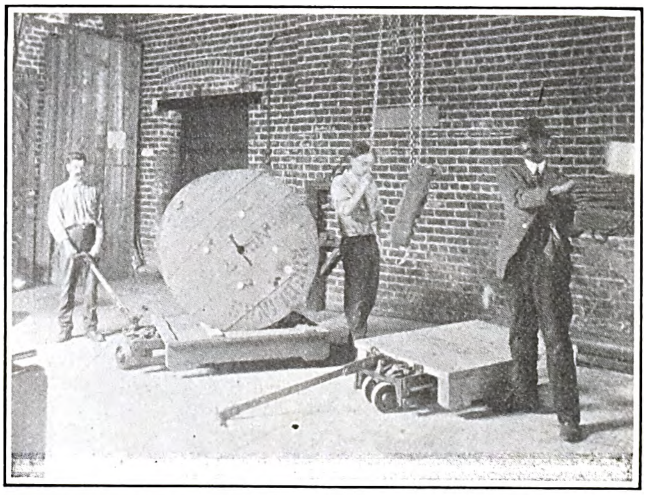
Transil oil is stored separately in an isolated metal house with concrete floor. The drums are thus protected from moisture, and small transformers can be filled under cover. Lead-covered cable and heavy transformers are placed on a concrete platform level with the body of the delivery truck. This convenience has greatly reduced the time, labor and cost of receiving and issuing these heavy stores. Fiber duct for underground conduit, although expensive material, has usually been piled on the ground, resulting in damage and inconvenience. It is now stocked neatly in racks made of cedar posts 12 ft. high, with the tops tied together by wire.

Reels of weatherproof cable and other heavy supplies for inside storage are unloaded on small, portable platforms and moved to position in the storeroom by lift trucks. When the lift truck is removed, the platform rests on the floor with the load on it, where it remains until issued for service. The lift trucks have a capacity of 3,500 lb. and cost $150 each. By their use a carload of heavy reels, each weighing 1½ tons, can now be received and stored without extra help in less than an hour. Formerly, it took half the day for a gang of men to do the same work. Moreover, the stock is in such position that one man with a lift truck can wheel it to the door of the storeroom, where it is quickly lifted to the delivery truck by an overhead hoist. A reel or transformer can thus be issued almost as quickly as a hand package.

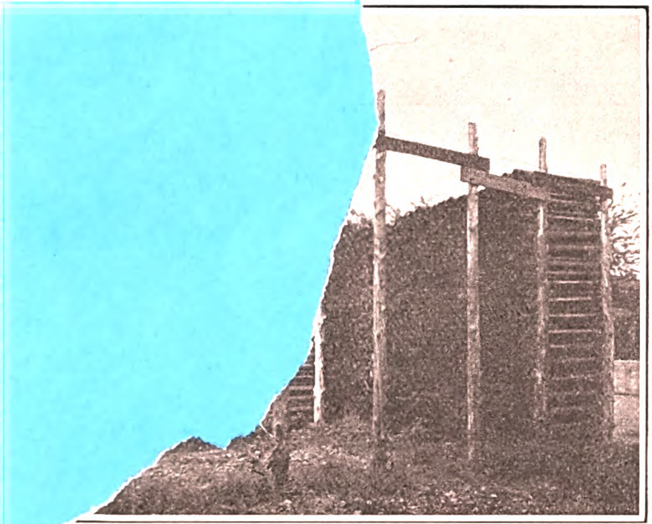
IMPROVEMENTS IN HANDLING METHODS

Heavy cases of electric equipment, kegs of track material, barrels of insulators, and similar packages which can be stacked, are piled one upon another by a stacking machine or portable elevator, which costs $334. By this means floor space is saved and the property is better protected against damage. The floor for such heavy stores is divided into sections, and aisles 4 ft. wide lined off by white paint give access to the stock.

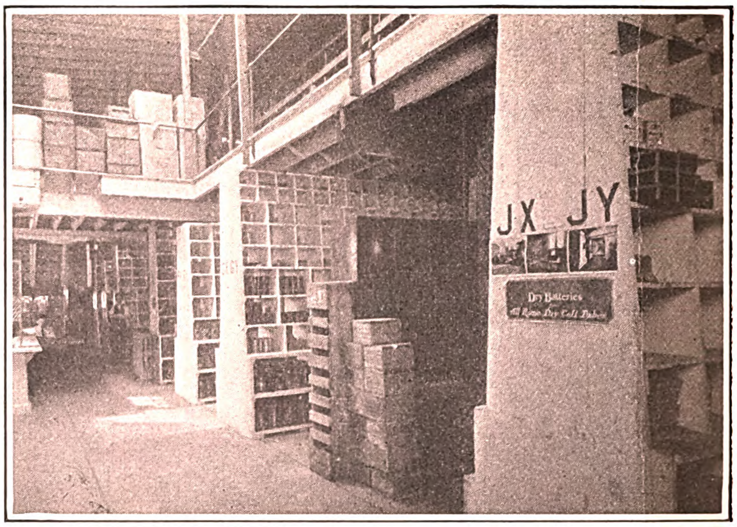
The time and expense required for installing the



Lift Trucks Having a Capacity of 3,500 Lb. Each Are Used to Handle Heavy Material. When in Position the Truck Is Lowered and the Platform Left in Place with the Load on It



Fiber Conduit Is Stacked in Open-Air Racks. These Are Made of 12-Ft. Cedar Posts Having the Tops Tied Together with Guy Wire



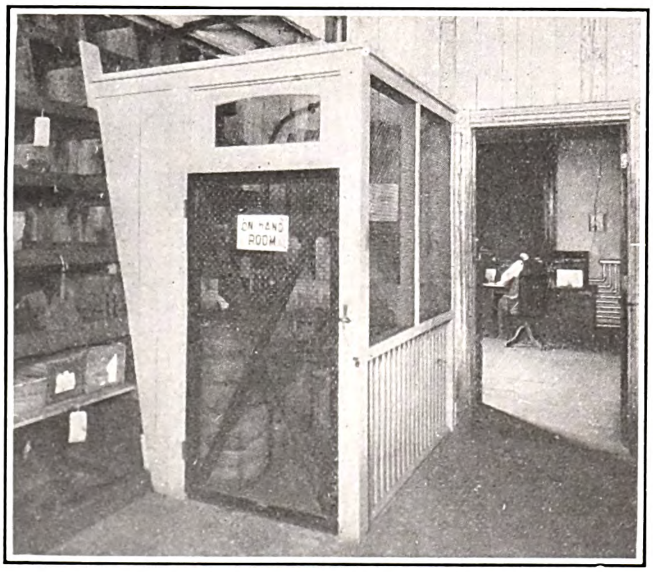
Main Storeroom Showing "Daylight" Cases for Material. The Unit System of Piling Is Used to a Limited Extent. Cases Are Painted White

system were moderate. In the Richmond storeroom a period of 17 months has been taken to lay out the work, tear out the old shelves and material cases, make and set up the new cases, rearrange all the stock, and write up the stock books. With this ample time allowed the change was made gradually. A few cases were built, or a small section was remodeled, at a time, thus avoiding disturbance of the regular routine in the storeroom. After each new case was installed, the material was placed in order on the shelves, following as closely as possible the adopted classification. When the cases had been in use long enough to insure satisfactory arrangement of the stock, the items were written up in the stock book in the order found on the shelves, and the work of installing the new system was done.

CHANGE MADE AT SMALL COST

In this storeroom about 5,000 different articles of stock are carried, of which 4,800 are stored in the building and 200 outside in the open air. The total value of the stock is about $260,000. The cost of installing the stock-book system, including new hoisting and trucking equipment, new material cases, and the salary of an additional clerk for part of the time, is $5,400, distributed as follows:

Taking out old material cases and setting up new cases complete	$3,952
Stock books and forms	152
Portable elevator, lift trucks, etc.	876
Additional clerk for six months at $70 per month	420
	$5,400



Locker Used for Storing Materials in Suspense, Such as Articles Rejected on Delivery or for Which the Proper Identification Has Been Delayed

This system has not been in service long enough to draw final conclusions as to the economy and other advantages realized. It is probable the benefits will not be reflected fully in the operating figures when available. It is nevertheless confidently expected that the new system will enable the stores department to supply the needs of the company more effectively, with a smaller investment in general supplies and with no greater expense in operating the storerooms. Some indirect benefits already appear evident. There is a better arrangement of the stock in the storeroom with smaller floor space occupied. Quicker service is given in receiving and issuing supplies, with better provision for protecting the stock from damage. The discovery and disposition of obsolete and surplus stock are made more frequently and effectively than heretofore. The good effect on the minds of the personnel, because of more perfect order and a better system of storing and handling materials, is apparent.

Overhead Test Material Painted Red

THE Department of Street Railways, Detroit, is following the practice of painting red all overhead material on test. This color attracts the attention of the line crew, which may remove this particular article so that it will be brought into the office for examination and reinstallation. Another advantage noted is that, as all test material is checked periodically until worn out or a condition is reached which makes replacement desirable, the red color makes identification easy and positive. A brief reference to this practice was published on page 88 of the issue of this paper for July 19, 1924.

D. U. R. to Operate Co-ordinated Rail-Bus System

Bus Lines Now Paralleling Interurban System Will Be Co-ordinated with Rail Service to Give Alternate Bus and Electric Car Service on Frequent Headway

PLANS of the Detroit United Railway to co-ordinate with its railway service the bus lines which operate on the highways paralleling practically all of its routes are rapidly nearing completion. The consummation of these plans will mark the end of the destructive competition which followed the completion of paved state highways, and which became very serious during the first half of the current year. Acquirement of the bus lines by the railway will permit bus and rail schedules to be staggered so as to give maximum frequency of service without the useless and wasteful duplication that has existed up to this time.

Along with these plans relative to service outside of Detroit, a novel and interesting terminal project within the city is expected to be in operation within a short period. In this case buses will be used to haul interurban passengers between terminal stations at the outskirts of the city and the present downtown interurban terminal. An earlier brief outline of this terminal plan was given in this paper, issue of Nov. 15.

Bus competition with the lines of the D. U. R. started in 1919, shortly after the completion of the paved road, between Mount Clemens and Detroit. Another bus line was put into operation, paralleling the division from Pontiac to Detroit. Although this competition began to be felt almost immediately it was not serious, due to the higher bus fares and also to the character of equipment operated by the bus men. As bus operation was extended so that these vehicles paralleled other divisions of the railway, passenger revenue continued to fall off. However, this loss was partially offset by increased earnings from intensive development of freight business.

The continued pressure resulted in various operating economies on the railway. Chief among the measures adopted was the increased use of one-man operation on local lines and within some of the communities served. Some of the existing equipment was remodeled for one-man operation and additional new cars of this type were purchased. When the changes, which are still under way, are all completed, there will be between 150 and 175 cars of this type in use on the property. It is estimated that this program alone will make a saving of approximately $500,000 per year.

In the spring of the current year, the situation arising from the bus competition became acute. Improved bus equipment and more frequent service made more serious inroads on the railway receipts. As this more frequent bus service was met by increased service on the rail lines, a fare war ensued, which rapidly brought matters to a climax. In some cases, bus fares were cut as low as 1 cent per passenger-mile, and these cuts were met by the railway. Such low fares induced some additional riding, but the increase was far from enough to compensate.

Improved bus equipment and more frequent service were also put in on some of the long-distance routes paralleling the railway lines between Detroit and Port Huron, Flint, Toledo, and Ann Arbor. A further loss in railway revenue resulted, and during the first 5 months of the current year the
no more than sufficient to pay a
and fixed charges only.

Practically all of the compet
granted certificates of convenie
amounted to franchises. A
Supreme Court has ruled tha
ignore the service of existing ste
lines in determining the public c
sity in connection with the grant
the existing bus route is taken i
passing on an application for a sec
same route. Consequently, purchas
seemed to be the only course left ope
to offer some assurance of eliminat
competition and give a co-ordinated service.

A subsidiary company, known as the People's Coach Company, has been chartered to operate railway buses. New financing to the extent of $2,000,000 has been approved by the commission, and this money will be used to cover additions to railway equipment, purchase of existing bus lines and extension of routes to give through bus service between the important cities of the state.

Where bus routes parallel the railway lines, a staggered headway will be arranged so that alternate bus and car service will be given. On the lines between Mount Clemens, Pontiac and Detroit, both cars and buses will be operated at intervals of 30 minutes, so that there will be 15-minute headway between alternate cars and buses. Thus a very convenient service will be given, but present needless duplication of service will be eliminated. The economies expected from the elimination of wasteful duplication are estimated to amount to $500,000 per year. Thus the combined result of one-man operation and the co-ordination of cars and buses is expected to make operating savings of approximately $1,000,000 per year.

Although bus and rail fares on some of the shorter lines were on the same basis and were very unprofitable, those charged by the buses on some of the longer lines were higher than rail fares. On the line between Flint and Detroit the railway fare is $1.58. Parlor cars are operated on this line and also on some of the other important divisions of the railway, and an additional charge of 50 cents is made. This parlor car service has proved to be both popular and profitable. The bus fare for a trip between Flint and Detroit has been $2. The company considers these fares to be on an equitable basis, but the fares on some of the shorter routes where competition forced the rates down to a basis 1 cent per passenger mile are not sufficient to meet the costs of operation even after the service is co-ordinated. On these routes application has been made to the commission for increased rates.

The terminal situation at Detroit has for some time been the source of considerable loss to the D. U. R. Within the city the interurban cars operate over the tracks of the city-owned street car system, and the speed is necessarily slow, with frequent stops that are annoying to through passengers.

During the year 1923, 9,250,000 passengers were carried into the city on the D. U. R. cars. This is considerably less than the total number of passengers that are brought in to the city limits, as many people leave the cars at the outskirts of town and ride the jitneys to the business district because of the saving in time that can be made. Others take the city street cars at the able to transfer to other points ict for the same fare, and with interurban cars.

a 6-cent fare for the ride from owntown terminal. Operating verage about 27 cents per car-cted just about meets this cost. this operation within the city 2,000,000 car-miles. The charge the use of its tracks amounted to s was in addition to other operating d a net loss on the operation of the the city area.

loss, buses will be used to haul pas-he outskirts to the center of the city. nals are under construction, one on each of in divisions of the D. U. R. lines. At these ter-nals, passengers will be transferred to the buses. In this way, a saving in time for the trip of between 20 and 30 minutes will be made, and it is expected that many people who now use the jitneys to make this saving will transfer to the buses. The revenue from the bus operation is expected to pay the entire cost, and thus a material saving will be made in comparison with the operation of interurban cars to the center of the city. The buses will operate express between the terminals and the business district and will do no local business.

The installation of the terminal bus service will be made gradually. For the present, parlor car trains will continue to operate into the center of the city over the street car tracks, so that passengers will have the option of transferring to the buses or continuing on the cars to the downtown terminal.

Hearings before the commission on some of the phases of the new plan are set for the latter part of November, and it is expected that if the commission approves, the co-ordinated operation will be started during the month of December.

Accident Costs Reduced 1.56 per Cent of Gross Earnings[*]

The Plan Adopted by the Memphis Street Railway a Year Ago Has Already Resulted in a Saving of Approximately $50,000, of Which the Trainmen Have Received Half

THE management of the Memphis Street Railway after trying various accident reduction plans, such as individual bonuses, prizes, etc., became convinced that the best plan would be one by which the savings in the cost of accidents would be divided between the company and its employees. Plans based on individual performance were thought to have a tendency to discourage the making of full reports of all accidents. On the other hand, a plan based entirely on the actual reduction in accident cost was thought to be free from this objection.

To make such a plan successful it was necessary to devise a method of determining accident costs within a short time after the occurrence of the accident. Previous experience indicated that damage claims were ordinarily settled or a lawsuit was brought within 60 days. Moreover, statistics running back over a period of years showed that the ultimate cost of all litigation was 6 per cent of the amount sued for.

With this experience in mind a new plan was put into effect on June 1, 1923. The actual amount expended each month in the settlement of claims, plus 6 per cent of the amount sued for during that month, was considered to be the accident cost for the month. For two years prior to June 1, 1923, accident costs had averaged 4¼ per cent of the gross earnings of the railway. The difference between this figure and the accident cost, figured as described above, would be the savings under the new plan and would be divided on a 50-50 basis between the company and the men.

It was decided to make the award periodically every three months, the men's share to be prorated on a basis of hours worked, no man participating who was not in the service of the company on the last day of the three months' period. If at the expiration of any period the cost exceeded the 4¼ per cent of gross, this excess was to be absorbed during the next period before any dividend was paid. Under this arrangement no bonus was paid unless there was an actual saving to the company.

The results obtained during the past year have been as follows:

Period Three Months Ending	Total Saving	Trainmen's Share
Sept. 1, 1923	$12,244	$6,122 or 1.75 cents per man-hour
Dec. 1, 1923	8,762	4,381 or 1.27 cents per man-hour
March 1, 1924	10,128	5,064 or 1.45 cents per man-hour
June 1, 1924	15,240	7,620 or 2.10 cents per man-hour

During the year ending June 1, 1924, the total number of accidents was 2,716 or a reduction of 7½ per cent from the number the preceding year, which was 2,937. The total cost of these accidents was 4.03 per cent of gross earnings, as against 5.59 per cent the year before. This reduction in the number of accidents was obtained in spite of the fact that the number of automobiles on the streets of Memphis increased to 25 per cent.

It has been found that this plan not only lessens the number of men requiring disciplinary action, but also makes the administration of discipline much easier and more satisfactory. On the first Tuesday of each month a meeting of the officials of the transportation department, the carmen's union and the claims department is held. All matters pertaining to safety of operation are then discussed. On the second Tuesday two meetings are held, one for the day trainmen and one for the night trainmen. At this time a discussion is held of the operation during the preceding month, good work of certain individuals is commended, and failures pointed out in a manner calculated to improve the operation. About three-quarters of the total number of employees attend these meetings.

The chief advantages of this plan have been found to be that it encourages the full reporting of all accidents or happenings, no matter how trivial. It also encourages politeness and courtesy on the part of the employees and stimulates their efforts to increase the gross revenue of the railway. Moreover, it promotes friendly feeling between the trainmen and the company and makes the administration of discipline easier as the majority of the men do not wish to have careless, indifferent or incompetent men retained in the service.

---

Bus Making Connection with Car Under the Co-ordinated Service Plan of the West Chester Street Railway

Transportation Service Co-ordinated in Southeastern Pennsylvania

The Acquisition of 11 Bus Lines and 8 Miles of Rail Route Has Enabled the West Chester Street Railway Greatly to Extend Its Operations and Population Contact — The Company Has Been Relieved of Paving Obligations—Railway Is the Backbone of the Bus Development

DURING the past 18 months the West Chester Street Railway, West Chester, Pa., has added to its system 8 miles of electric railway lines formerly belonging to other companies, and has acquired nearly 200 miles of non-competitive interurban motor bus routes. The unified system serves approximately 1,000 square miles of populous and fast-growing territory in southeastern Pennsylvania and northern Delaware. A map of the system appears on another page.

By the acquisition of these bus and rail lines the company has added substantially to its earning power at comparatively small expense, by bringing large sections of populous territory, heretofore isolated, into direct contact with its railway system. Although the unified system as shown on the map has been established only a few months, the company is obtaining regular traffic on its railway lines from territory which in the past, without bus connections, yielded only occasional revenue. Judging from these satisfactory results, it is thought that with proper co-ordination of service and the use of comfortable and attractive equipment and adequate advertising to inform the public of facilities afforded, the volume of traffic carried on both railway and bus systems will be further increased.

In addition to the income from scheduled bus service, considerable revenue is derived from the sale of gas and oil, private automobile storage and from the hire of buses by private parties for sightseeing trips and other purposes. The company considers the latter class of business susceptible of large and profitable development on account of the flexibility of the bus and the character of territory, which is rich in points of historical and educational interest and gridironed with concrete and hard-surfaced roads.

Some of the Picturesque Territory Through Which the West Chester Street Railway Operates Its Interurban Service

The West Chester Street Railway was incorporated in 1890. It owns and operates two interurban lines aggregating about 37 miles of single track. One extends north and west from the Borough of West Chester, the county seat of Chester County, to Downingtown and Coatesville, a he other extends south and west Kennett Square, Avondale and of more than 21 miles. Connec- ester with the Philadelphia & ompany, giving direct and fre- lphia.

n of the railway serves an im- on of Chester County, centering wningtown. Between these points he Lincoln Highway and parallels e Pennsylvania Railroad. Because sing shortage and the character of trict seems destined to have consid- l development. The southern division, West Chester through the Brandywine district and Lenape Park, a popular summer to Kennett Square and West Grove, serves not y the local interborough traffic in southern Chester County centering in Kennett Square, but also the through traffic to the county seat and to Philadelphia.

Railway and Bus Routes, Locally Known as the "Chester Valley Lines," Serve an Area of 1,000 Square Miles

Prior to 1923 the railway's southern division terminated at Kennett Square. In that period the Kennett & Wilmington Electric Railway, an independent company, operated two divisions, one extending west from Kennett Square, a distance of 7½ miles through a well-developed section to the neighboring towns of Toughkenamon, Avondale and West Grove, while the second extended south a distance of 14 miles through rural territory to Brandywine Springs on the outskirts of Wilmington. Losses on this rural division more than offset the gains on the interborough line between Kennett and West Grove, with the result that service was abandoned in the spring of 1923.

About this time Kelly, Cooke & Company, engineers, Philadelphia, for many years associated with transportation work in southeastern Pennsylvania, acquired control of the West Chester Street Railway. The new management promptly took steps to secure the profitable section of the railway formerly in operation from Kennett to West Grove, and by this means to obtain not only the local traffic between these points, but also the additional through six-fare business to the county seat from points in the southern part of the county. The property was taken over in October, 1923, and reconstruction work was immediately undertaken.

Traffic on the West Chester-Kennett division was produced primarily by the terminal populations at West Chester and Kennett Square, and secondarily, by the connecting railway lines to West Grove and Brandywine Springs. This feeder service for years had been handicapped by irregular operation, due to derailments and other causes. Unsatisfactory as this connecting service had always been, it was utilized as a matter of necessity and brought considerable "county seat traffic" to the Kennett division of the West Chester Street Railway.

The line from Kennett to West Grove has now been reconstructed, through service having been inaugurated in July, 1924. The annoying necessity of transfer at Kennett has been eliminated and a great improvement in the regularity of service and the character of the equipment has been effected. The company has equipped nearly all of its cars with luxuriously upholstered seats built to order by the Hale & Kilburn Company. Seating accommodations include swivel armchairs, which have proved a popular innovation. The marked increase in pleasure riding which has occurred is attributed by the management to the pleasant riding qualities of the new seats. An interior view of the improved car is shown in an accompanying illustration. Present indications are that the increased passenger revenue on the extended Kennett division will be approximately three times the increase in operating expenses and fixed charges.

Another important phase of this situation is that under ordinances enacted by the city of Coatesville and the Boroughs of Downingtown, West Chester and Kennett Square the company has been permanently relieved of former paving obligations in these communities. Typical sections of paved track, which has practically all been rebuilt with heavier rail sections in concrete or permanent base, are shown in accompanying pictures. Except in these towns the tracks are nearly all on private right-of-way and are unpaved.

Recently the company has also acquired about 1 mile of paved track extending from the terminus of its line in Coatesville, south on First Avenue to the plant of the Bethlehem Steel Company. This extension will permit the operation of a more frequent service along the main street in Coatesville, and will enable the company to gain considerable local revenues heretofore lost on account of the 30-minute headway of the interurban service and of its inability to handle the industrial traffic to its final destination.

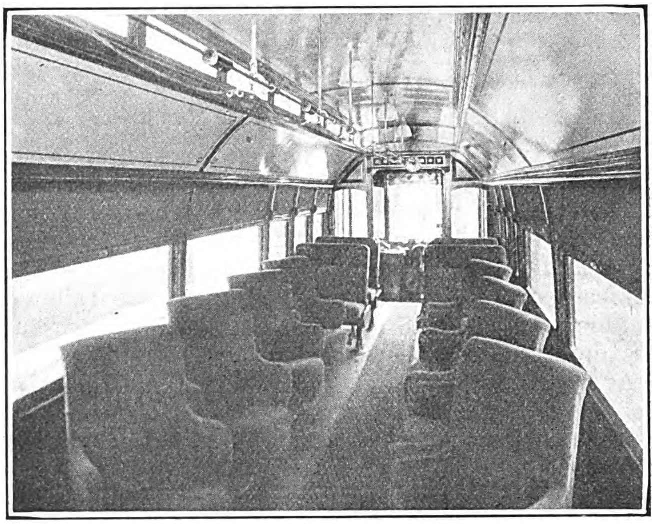
The First Avenue track was formerly the property of the Coatesville Trolley Company, organized to construct an electric railway from Modena (about 3 miles south of Coatesville) north through Coatesville to Honey Brook. About $80,000 was spent in constructing the First Avenue track before funds were exhausted and the project abandoned. The track, which has never been in operation, is constructed of 90-lb. girder rail set in concrete, with a diamond turn-out centrally located, and was obtained by the West Chester Street Railway on most favorable terms.

WHEN AND HOW BUS LINES WERE ACQUIRED

On account of the location of the railway system in relation to the communities which it serves, and to connecting highways leading to near-by population centers, the inauguration of a supplemental bus service was seen to be necessary to increase and stabilize railway revenues through an enlarged and diversified population contact. While the management considered that the construction of new electric railway lines connecting certain sections of the territory would in the end be more profitable than buses, it was found that this would have required extensive construction along parts of the primary concrete highways for which franchises would be difficult, if not impossible, to obtain. For this reason decision was made to utilize the bus as the most immediately available substitute.

As an initial step in the execution of its plan for a co-ordinated railway and bus service the West Chester Street Railway in June, 1923, bought control of the Peoples Transportation Corporation. This was a small company organized in 1920 to operate buses on the Baltimore highway between Media, the county seat of Delaware County, and Kennett Square, and also between Concordville and the city of Chester. In purchasing the Peoples Corporation, the railway accomplished several objectives at one stroke. A going company was thus acquired through which to operate the railway's buses, and control obtained of routes entering the populous Chester district from the northwest via the Concordville concrete highway. The railway was also placed in a good position for acquiring bus routes into Wilmington.

In October, 1923, the routes from Kennett south to the Delaware and Maryland lines, together with others in the city of Wilmington, were granted to the Peoples Transportation Corporation, thereby placing under one management all bus transportation between the boroughs of southern Chester County and Chester and Wilmington.



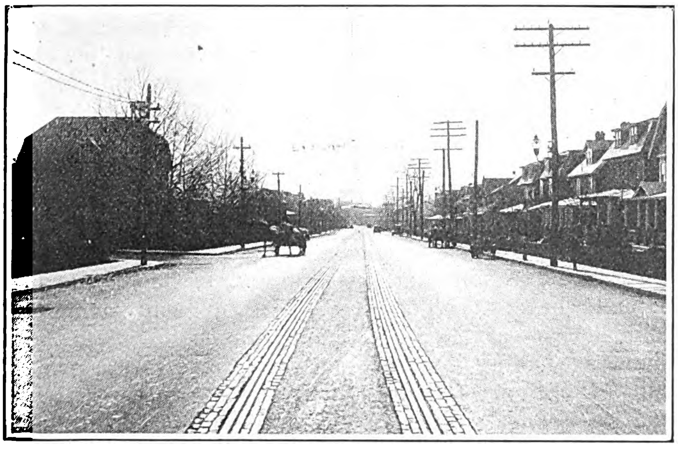
Parlor Cars Equipped with Revolving Armchairs Are Inducing Pleasure Travel

In northern Chester County the same company also acquired by purchase a route extending from Downingtown east on the Lincoln Highway to Exton, thence northeasterly through several small villages to Phœnixville, an important industrial center. Pending the acquisition of other routes in this territory, this resulted in a franchise covering the entrance to Downingtown (a railway terminal point) and also to the principal borough in the northeastern section of the county.

ACQUISITION OF OTHER FRANCHISES HAS EXTENDED POPULATION CONTACT

Franchises have also been obtained covering the Lincoln Highway from Downingtown through Frazer, Malvern, Paoli and Devon to Strafford, connecting there with the Philadelphia & Western Railway, operating a 20-minute high-speed electric service to Philadelphia. The route from Strafford to Valley Forge National Park and Phœnixville has also been secured to develop pleasure travel to that historic point. This route, passing through a region of great natural beauty, offers a very attractive and convenient means of reaching Valley Forge from Philadelphia.

Other franchises granted to the company are those between Norristown and Phœnixville and between



Coatesville, Terminal Point of the Railway System

A Section of the Railway in Downingtown

Phœnixville and the near-by boroughs of Spring City and Royersford, which gives to this important district the advantages of a permanent and unified bus transportation system. Following the acquisition of these franchises the corporation obtained the right to extend its Phœnixville line and also its Chester line into West Chester (the railway terminal), thus completing the unified system. The effect of this has been to bring large sections of population, heretofore isolated, into contact with the railway, thus aiding materially the development of long-distance riding on the railway. It has taken about 18 months to establish the various bus lines and the railway extensions.

As of November, 1924, the Peoples Transportation Corporation owned and operated 21 motor buses of seating capacity ranging from 12 to 30 passengers. It is planned by the West Chester Street Railway still further to improve its equipment and extend its facilities to permit of more economical centralization of maintenance work.

Extensive Use of Advertising

While each route has been placed in operation as acquired, it has only been within the past 2 months that the company has been in a position to advertise the service as a whole, due to the necessity of first modifying the original schedules of each route and coordinating them with the requirements of a unified system of operation. The management estimates that it will take about a year of "cut and try" to fit these to the public need and fully to develop the traffic potentially tributary to the lines.

One form of advertising which has produced results is shown in an accompanying illustration. As another means of informing the public of its service facilities, the company publishes a standard form of time-table for each railway and bus line with a map of the system, and giving telephone numbers throughout the territory through which further information can be obtained. These booklets are placed in multiple pocket schedule boxes located at advertised points and in all railway cars and buses. Large numbers of schedules are also being constantly sent through the mails upon request, it being considered that every inquiry or schedule taken represents a probable patron. The company has also issued an attractive illustrated folder describing many points of historic and educational interest in the territory served by its lines, which is particularly rich in its Colonial history.

Public Relations

One of the interesting results of the company's constructive program has been the complete reversal effected in public sentiment. Whereas formerly this had been decidedly antagonistic, there now appears to be a friendly feeling and a good word on every hand for what the company is accomplishing in the way of property and service betterments. An editorial in the Coatesville *Record*, entitled "Pleasing the Public," shows how the public responds to genuine efforts to make traveling more pleasant and comfortable. This editorial said in part:

> Credit must be given officials of the West Chester Street Railway for the manner in which it is serving the public.
>
> The present management of the trolley company apparently realizes that it prospers most when it gives the best possible service, and there is plenty of evidence that it is spending both energy and money in its plan to render such service. Improvement in tracks and roadbed, remodeling and renovating of trolley cars, additions to service through more cars and better schedules—these have gone a long way toward bringing to the company a hearty public support which it must be admitted was entirely lacking only a few years ago. This condition is shown also on the motor bus lines operated by the same company.

Large Tributary Population

The total population of the territory in contact with the bus system is 336,423, and with the co-ordinated railway and bus system 359,517. Of this 93,194 is in Chester County; 68,352 in Delaware County; 70,834 in Montgomery County, and 127,137 in New Castle County, Del. This population is only that of the territory in direct contact with the railway and bus lines and does not include any part of the large population between that territory and the western boundary of the city of Philadelphia. The latter district is directly connected by seven high-speed electric lines with Philadelphia, containing more than 2,000,000 people. All these lines enter the Union Terminal Station at Sixty-ninth Street, which is also the terminus of the Market Street subway and elevated lines of the Philadelphia Rapid Transit Company. There are about 190,000 people living in the intermediate territory west of Philadelphia, which is the most rapidly growing district adjacent to the city. A large part of this population lies immediately to the east of the bus terminals and is tributary in varying degrees to the bus lines by reason of connecting railways which traverse this territory en route to Philadelphia. The population per mile of route for the bus system is 1,780, and for the railway alone, 1,320, which indicates the extent of possible future development of the traffic.

THE WEST CHESTER STREET RAILWAY COMPANY AND ITS SUBSIDIARY,
THE PEOPLE'S TRANSPORTATION CORPORATION

Advertising the Special Trip Service

Demands for service to accommodate parties for special trips for distances varying between 10 and 200 miles are frequent and increasing. It has been impossible heretofore, owing to lack of equipment, to furnish this service except in occasional instances, but plans are going forward actively to provide for it. With the intercommunity activities in this territory and its richness in points of historical and educational interest, it is believed that revenues from this class of service are subject to considerable development.

Association News & Discussions

Iowa Association Discusses Maintenance

Track Construction, Automatic Substations, Bus Operation, Equipment Maintenance, Electric Welding and Lubrication Furnish Subjects for Fall Program and Lively Discussion

APPROXIMATELY 100 members of the Iowa Electric Railway Association assembled at Des Moines on Nov. 13 and 14 for a busy two-day session devoted to a discussion of many operating and maintenance problems. Comparison of practice and exchange of experiences helped to make the meeting particularly valuable to the operating men present from the standpoint of furnishing fresh inspiration and many practical ideas for modernizing.

In addition to strictly railway subjects, the bus also was taken up in one paper, and the discussion showed plainly that many of the railway men present are actively interested in this vehicle for the transportation of passengers, and are rapidly accepting the idea that the electric railway companies of Iowa are the logical agencies to control and operate transportation lines on the highways of the state.

The meeting was opened by chairman John Sutherland, master mechanic Tri-City Railway. Track construction, automatic substation operation and maintenance and bus operation occupied the first morning session. The afternoon was spent inspecting the various departments of the Des Moines City Railway and the Des Moines & Central Iowa Railway. The second business session took up the subjects of equipment maintenance, welding practice and lubrication. The entire association was entertained at luncheon as the guests of the management of the Des Moines City Railway, and an evening banquet completed a full entertainment program.

A paper by M. W. Freund, superintendent of way and structures Tri-City Railway, Davenport, on the construction and maintenance of street railway track, is abstracted elsewhere in this issue. In the discussion of this paper, R. H. Findley, superintendent of track and roadway Omaha & Council Bluffs Street Railway, said that in Omaha the railway company is trying to unload its paving burdens. He cited some examples of maintenance problems in Omaha, and said that the tendency toward lighter rolling stock equipment was giving the track department relief in two ways: First, in making it possible to construct at less expense new track that seems to stand up satisfactorily under lighter equipment; second, in cutting down the wear and tear on track now in the street. He also said that the use of modern tools like pneumatic tamping equipment, by improvement in tamping, make it possible to cut down somewhat the thickness of ballast required. He favored a sand cushion only in preference to sand and cement under brick pavement, but pointed out that the results obtained depended largely on the local drainage conditions.

Some results obtained from the use of a new quick-hardening cement called Lumnite were described by W. L. Wilson, chief engineer maintenance of way Des Moines City Railway. Mr. Wilson said that this material was extremely handy for patchwork and for concreting short stretches where quick hardening made it possible to allow traffic on the new material after a very short interval. Later in the program, the chairman, at the suggestion of Mr. Wilson, called on Mr. Campbell of the Atlas Lumnite Cement Company to describe some of the properties of this new material which it is putting on the American market.

Track joints were held to be the critical part of the track construction by C. M. Feist, master mechanic Sioux City Service Company. He said that the receiving rail gets a severe hammer blow unless the joint is perfectly level and smooth, and stressed the importance of grinding joints until they are in this condition after welding. Mr. Jameson, of Jameson-Ross Company, said that most track men considered it good practice to grind all joints when laying new rail. Mr. Freund said that the practice in Davenport is sometimes to make the joints slightly above the rest of the rail and then to grind them level.

In a discussion of the use of fillers in brick pavement near the rail, F. V. Skelley, assistant manager Tri-City Railway, cautioned against the use of materials that would flake off and cause derailments. Mr. Findley thought that pitch had been used in the case cited, as he held that it would flake off in cold weather, but that a good grade of asphalt filler would not cause trouble from this source.

"Experience in the operation and maintenance of automatic substations" was the subject of a paper by D. H. Nail, superintendent of power Des Moines City Railway, which is abstracted elsewhere. In the discussion it was pointed out that relief from labor difficulties, as well as elimination of the expense of attendants, was one of the most outstanding advantages of automatic operation.

W. G. Lamb, master mechanic Waterloo, Cedar Falls & Northern Railway, read a paper giving the experience of his company in the operation and maintenance of buses. In 1922 the Johnson Motor Bus Company, operating on the paved road between Waterloo and Cedar Falls, was taken over by the railway and modern 25-passenger buses were put in service on a 30-minute headway between 6:30 a.m. and midnight. A new garage was erected adjacent to the car shop with facilities for the proper inspection and maintenance of the bus equipment. The bus fleet averages between 800 and 1,000 miles per day. The master mechanic has charge of the maintenance of buses as well as railway equipment, and the operation of the new service was placed in charge of a supervisor of bus operation, reporting to the superintendent of the property. The careful records kept give a complete history of the performance of each bus. Facilities for filling the buses when they go out in the morning were installed. Special tanks of 40 gal. capacity enable the buses to operate the full day without refilling.

Attention is given to the appearance of the buses and the drivers are trained in courtesy. Co-operation between the operating and mechanical departments enables small operating troubles to be remedied before they become serious and tie up equipment. Maintenance cost between Jan. 1, 1924, and September 30, 1924, amounts to approximately 7.1 cents per bus-mile, made up as follows:

Superintendence of maintenance..	$0.00161
Repairs to bus bodies	.00381
Repairs to chassis	.00854
Repairs to transmission	.00073
Repairs to engines	.01023
Repairs to ignition and lighting.	.00285
Painting and varnishing.........	.00168
Tire renewals	.01283
Bus depreciation	.02828
Maintenance of garage	.00049
Total	$0.07105

Total operating expenses of the bus fleet per bus-mile were placed at 15 cents.

Tire performance is watched closely and an average of 23,000 miles, with a maximum of 48,000 miles per tire, is obtained. Bus overhaul periods are fixed by the condition of each bus after a careful inspection rather than on a predetermined mileage, and wide fluctuation in the mileage between overhauls is obtained on different individual pieces of equipment of the same manufacture. Buses that have been overhauled and have made a total of close to 200,000 miles are still found to be in first-class operating condition, Mr. Lamb said. He emphasized the importance of careful attention to the little items of maintenance as the best precaution against serious damage to the equipment and consequent heavy maintenance expense. Proper lubrication was held to be an important factor in avoiding high maintenance and serious interruptions to service.

Mr. Skelley reported that the operation of buses by the Tri-City Railway to date was costing 15.2 cents per bus-mile. The buses are used as feeders only and the service is very light. Income averages about 12 cents per mile, making a net loss on the bus operations of about 3.2 cents per mile. Pull-ins due to failures are about one per 3,000 miles of operation and are all due to minor defects such as fan belts, punctures, etc.

A. E. Johnson, supervisor of bus operation Waterloo, Cedar Falls & Northern Railway, said that the bus is a legitimate means of transportation, primarily because it is popular with the public. He felt, however, that the use of reduced fares in the battle for business is all wrong, and sets a dangerous precedent which is very liable to make it extremely difficult to adjust fares to a profitable point when the use of the new vehicles becomes stabilized. First-class equipment, careful supervision, courteous drivers and the maintenance of safe operating conditions and reliable service were held to be the proper weapons for a railway bus operator to use in a fight for business with competing lines. As an example of the safety of properly supervised bus operation, he cited the experience of his company, which has hauled more than a million passengers without an accident to a passenger except where one was hurt in a slight scuffle when the bus was standing still at the curb. Careful selection of drivers and comfortable and attractive equipment were held to be of paramount importance in fullfilling the modern conception of good transportation service. In special party service he said that his company made a flat charge of 50 cents per running mile.

Some sidelights on the bus operating insurance situation in Iowa were given by M. A. Welsh, superintendent and traffic manager Waterloo, Cedar Falls & Northern Railway. Mr. Welsh explained the provisions of the motor carrier law of the state which required every operator of motor buses to carry insurance in a company approved by the commission. Under the mandatory provisions of this law, the cost of insurance for liability only would amount to about $707 per year per bus, according to Mr. Welsh. He said that his company finally succeeded in getting relief from this heavy burden by convincing the commission that the prior lien provisions of the Iowa laws which give an injured passenger a prior lien on all the property of the company was protected by the large fixed investment of the railway within the state. To satisfy mandatory provisions of the motor vehicle law relative to the filing of a bond by a motor bus operator, a nominal bond was finally accepted by the commission, thus materially reducing the cost.

A paper by W. M. B. Brady of the General Electric Company dealt with the many applications for electric arc welding in salvaging electric railway materials. Mr. Brady listed a large number of items which could be profitably salvaged by welding, and gave comparative figures to show the savings which had been made in several instances from reclaiming worn parts. He described some of the applications for automatic welding apparatus manufactured by his company, with particular emphasis on the economies which could be made by welding rolled steel wheel flanges by this method. He said that preheating and annealing of welded wheels was not successful, and in addition was very expensive. This is unnecessary in welding flanges with automatic equipment, according to Mr. Brady. He attributed the lack of trouble from cracking, when the automatic welder is used for building up flanges, to the uniformity of the work as compared with hand welding, which has not proved successful in some instances. He opposed attempting to weld worn treads, as he said this produces severe and injurious strains in the material due to the extremely high temperature resulting from laying on such a large amount of material.

Mr. Lamb said that hand welding of 36-in. wheels on his property had given no trouble. J. G. Munson, master mechanic Cedar Rapids & Iowa City Railway, reported that his company has been building flanges on interurban equipment with hand welding equipment for 7 or 8 years and has experienced no difficulty. The use of welding for building up flat spots in wheels was also reported on favorably by several of those present. Welding of worn axles and armature shafts was not recommended, as it was felt by some that these parts should be scrapped when they have become so worn as to require building up the journals. Mr. Feist described the practice on his property of using a pit grinder to keep the tread diameters of mating wheels the same, and attributed freedom from sharp flanges to this practice. Mr. Munson concurred in the conclusion that the practice of keeping wheels ground to the same diameter gave freedom from sharp flanges and cited an example from his experience of wearing out rolled steel wheels completely on single-truck safety cars without turning, by putting on wheel-truing brake shoes whenever the wheel diameters became slightly different.

Mr. Skelley read a paper prepared by T. E. Wood, master mechanic Omaha & Council Bluffs Street Railway, on the maintenance of equipment. In this paper Mr. Wood pointed out the need for reduced maintenance cost to meet the materially decreased revenue of many electric railways, and held that increased efficiency of maintenance men, the adoption of the most improved methods of doing work and general raising of employee morale through good management by the head of the department were the methods by which this result can be accomplished. Mr. Wood said that the car inspector plays one of the most important parts in the maintenance of equipment and emphasized the importance of selecting and training these men with extreme care. A blueprint form used by the Omaha company for sending a comparative statement of equipment failures to the various carhouse foremen helps materially in getting more careful inspection by inspiring a spirit of rivalry among the various foremen. He said that systematic inspection is the first step in getting good inspection and reported that all of his company's cars are equipped with Economy meters, which help materially in assuring inspection at proper intervals.

Another method of helping the various foremen to do good work, according to Mr. Wood, is to furnish them with copies of blueprints showing car wiring diagrams, part numbers of car equipment for ordering purposes and any other information which will help them in making repairs or replacements to parts. Keeping a complete file of foreign prints which is always available to shop foremen and from which information can readily be furnished to carhouse foremen was also considered a help in getting good results in Omaha. Mr. Wood said that dipping and baking of armatures had been a distinct success in reducing armature maintenance. He also described the Omaha company's method for cutting the cost of painting by minimizing on labor and material.

Mr. Feist called attention to the trolley wheel as a source not only of maintenance cost, but also of power loss. Mr. Anderson said that his road had obtained average mileages of between 20,000 and 22,000 miles from wheels of the type designed by Mr. Feist. With this type of wheel, Mr. Anderson also said that it had been able to do away with one night inspector at each of its stations. In answer to a question Mr. Wood said that it was the practice on his property to have the Economy meters read by the transportation department. Mr. Sutherland said that the savings during the first year after the installation of Economy meters in Davenport amounted to $12,000. In answer to a question he also said that the average number of pull-ins for all mechanical causes on the cars of the Tri-City Railway, including fenders and broken glass, was 6,400 miles per pull-in.

John S. Dean, Westinghouse Electric & Manufacturing Company, read a paper prepared by C. Bethel of the railway motor engineering department of his company on the subject of lubrication of railway motors. In this article Mr. Bethel not only outlined some of the high spots in correct lubrication practice, but also gave charts and curves illustrating in detail some of the reasons for these conclusions as shown by careful tests conducted by his company. A complete article by Mr. Bethel on this subject was published in ELECTRIC RAILWAY JOURNAL, issue of April 19.

The paper was received with interest by the Iowa men, and many sidelights on lubrication practice were brought out in the discussion. Mr. Feist said that he believed in the use of plenty of oil, and although this material should not be wasted, he felt that the loss of one armature through insufficient lubrication would more than offset all the savings made through restricted use of oil. The most important item in lubrication procedure, according to Mr. Feist, is to make sure that the man in charge of the work does not miss a bearing through carelessness when going over a car. Mr. Welsh of the Viscosity Oil Company said that if every operator followed closely the suggestions contained in Mr. Bethel's paper there would be very few lubrication failures on electric railway equipment. Mr.

Feist attributed most equipment troubles to the vibration caused by poorly lubricated and worn parts. Mr. Dean described various methods used by railways for making bearings fit tight in the motor housing after they have become worn. One method described was that of driving a drift through the shell to expand the outside diameter, and the other consisted of copper plating the outside of the worn shell until the desired diameter had been obtained. In this latter method the bearing is first babbitted and then copper plated, after which the babbitt is bored out to the correct diameter to fit the shaft. He said that the cost of the process averaged about 30 cents per bearing. Mr. Dean also described a new type of oil seal housing which is being perfected by his company, but is not yet on the market.

At the conclusion of the meeting, a nominating committee consisting of C. M. Feist, John Lewin and W. G. Lamb brought in a recommendation for the membership of next year's convention committee, which was unanimously approved. The members elected to this committee are as follows: W. L. Wilson, engineer maintenance of way Des Moines City Railway, chairman; R. H. Findley, Omaha; R. C. McMahon, Des Moines; W. G. Lamb, Waterloo; W. A. Clough, General Electric Company; F. R. Grant, Westinghouse Electric & Manufacturing Company, and H. R. Sampson, Ohio Brass Company. John Sutherland, master mechanic Tri-City Railway, was re-elected chairman of the meeting for next year.

Maintaining Street Railway Track[*]

BY M. W. FREUND
Superintendent of Way and Structures
Tri-City Railway, Davenport, Iowa

IN ANY track repair job the procedure depends on the condition of the rail, joints, ties and the foundation under the ties. One stretch of track in Davenport approximately 1,800 ft. long on a 4 per cent grade was 18 years old. This was built of 7-in. tram rail, ties 2½ ft. center to center, and was in very bad condition. The rail in this track was worn down to such an extent that there were two, and in some places three, grooves in the tram. These grooves were so deep that the wheel flanges could not slide sidewise from one groove to the other, and as a result cars were being derailed at the rate of one per day. Relief at minimum cost was obtained by renewing one rail of the track with a tram rail which had sufficient depth to permit the flanges of the wheels on one side of the car to slide sidewise on the head of the rail. This track has been operated more than 3 years without a derailment.

We have renewed the rail on several other stretches of track at comparatively small expense. These stretches were built new in 1903 with 7-in. tram rail, ties 2½ ft. centers, ballast under the ties. In 1912, on account of street paving by the city, it was necessary to reconstruct these stretches of track. The old rail and joints were used, but 50 per cent of the ties were replaced. The ballast was removed and 6 in. of concrete placed under and between the ties. By 1924 the rail and joints had become very poor in condition. The brick paving concrete foundation and the ties were still good. In this case, 10 in. of paving on each side of the rail was taken up, and the rail was carefully shimmed with steel and wood shims and was then spiked to the old ties.

Rail joint repair practice varies with the conditions encountered. When the joints are tight, whether welded or bolted, and there is a very slight cup, it is our practice to grind the joint to a perfect surface with a reciprocating grinder. When the joints are tight and the cups are deep, the rails are built up with an arc welder using hard steel, and are then ground with a rotary grinder. If the joint plates become loose but are still in good condition, they are rebolted, and usually are welded to the rails. When the joint is loose and plates are also badly worn, new plates are welded to the rails provided both rail ends are in good condition. In the case of joints on Lorain section 80-316 rail—we have experimented with welding the old continuous joints after the base support has been cut off, making them fish plates. These plates are set in close to the web of the rail at the base. The top of the outside plate is set ⅛ in. out from the head of the rail. The joint is then bolted with six bolts and welded to the base, the outside plate being welded only at the top. As it is very difficult to weld the inside plate at the top, the welding is omitted. When the joints are loose and the rail ends are broken, it is necessary to cut out the broken rails and insert a piece of rail with two new joints. The length of the rail cut in depends on the tie spacing, varying from 4 ft. to 14 ft., the latter being used when ties are on 6-ft. centers. The new joints are always placed over ties.

New joints that are being put in are ⅞-in. machine plates with four-hole drilling. These are welded to the rail at the head and base by either the carbon or metallic arc. There are three welds made on tram rail, and four on tee rail. Rails are cut through the head with a hack saw and the remaining part of the cut is made with an oxyacetylene torch.

When repairs are necessary to manganese centers in special work, they are built up with a special manganese welding rod, which gives satisfactory results providing the welding is done according to instructions. Loose hard centers are not welded until after they are tightened. This is done by removing bolts and raising the center on shims to the proper elevation and then replacing bolts and tightening. After the center has been reset and the cars have operated over it for a few days, it is again tightened and the bolt holes filled with hot asphalt.

New track in Davenport is constructed with 8-in. stone ballast, creosoted oak ties spaced 2 ft. center to center, 7-in. 80-lb. tee rail, 25-in. four-hole machine joints and tie rods spaced 10 ft. The joints are opposite and are welded by the carbon-arc process to the head and base of the rail, mild steel insert being placed between the rail ends before welding. All new track is ground with a reciprocating grinder.

In the reconstruction of old track the best of the old bricks are saved. The rails are then jacked up from the ties and removed, the ties remaining to be removed by the steam shovel. After the grading is completed, the sub-grade is rolled, and 6 in. of stone distributed and rolled. The ties are spaced on 2-ft. centers, the rail distributed and spiked, after which sufficient stone is placed in the track to raise to grade and tamped with Ingersoll-Rand pneumatic tie tampers. After tamping, the cars are permitted to operate over the track in order to hammer it down thoroughly. It is then raised to grade and retamped, the interval between tampings depending upon the frequency of the car service, the average time being four days. After the second tamping the track is lined and is then ready for the concrete paving base, which is placed during car operation. Brick paving is laid on a 1-in. cement mortar cushion mixed 1:4, and is filled with 1:2 grout. Vehicular traffic is not permitted on the paving for at least 4 days.

Where the old track is in solid concrete other methods are employed to do the excavating. Air hammers are equipped with chisel points and are used to loosen the ties from the concrete and cut a channel along the edge of the excavation. Where the concrete is 10 to 12 in. thick it is necessary to use steel tipped wooden prys 4 in. x 6 in. x 12 ft. long to raise the concrete, which is then broken with heavy sledges. This concrete is crushed by a portable crusher and used as ballast in the new track.

During the winter of 1923 and 1924 the Tri-City Railway made a number of track changes in Davenport on account of the rerouting of the cars. The work was done in the most severe weather, the temperature on many days being below zero. In making the excavations, it was necessary on a few jobs to remove 21 in. of frost. After this was completed, the building of the track, including tamping, was done with very little difficulty. Concrete was placed on days when the temperature was higher than 20 deg. F. We did not have much success heating the materials for concrete before putting them in the mixer, as the amount of material needed for concrete for one day was considerably larger than could be heated. We used a mixer that could deliver 6 cu.yd. of concrete per hour, and heated the materials after they were placed in the mixing drum with a Hauck concrete heater. After being placed, the concrete was covered with straw on the top of the rail, and the straw in turn was covered with a cheap grade of tar paper to prevent the wind from blowing it away and also to help retain the heat in the concrete. When the weather was not too cold, the straw and tar paper were removed after 48 hours. The concrete was then swept clean and heated with large paving heaters and paving lard. The sand for the paving cushion was heated on old junk boilers. Steam from a portable boiler was used to heat the water that was used for making the mortar paving cushion and the cement grout. Immediately after grouting, the paving was covered with the straw and tar paper, and was thus protected for at least a week when the weather was moderate, and longer when it was very cold.

---

[*] Abstract of a paper presented before midyear meeting of the Iowa Electric Railway Association, Des Moines, Iowa, Nov. 13, 14, 1924.

Experience with Automatic Substations[*]

By D. H. Nail
Superintendent of Power Des Moines City Railway, Des Moines, Iowa

Automatic substations do not require a great deal of attention other than periodic cleaning and inspection. In the early use of these stations in Des Moines they were inspected twice each month. Later on we found that this time could be extended to once each month without any trouble occurring to the equipment. The buildings in which these equipments were installed are fireproof and well ventilated. When inspections are to be made the station is shut down after the morning peak load is over, the machine is blown out and the switchboard and the station are cleaned up. Compressed air is furnished by a portable air compressor operated by a 600-volt d.c. motor. This compressor is transported in a truck to each station when inspections are made.

After the station has been blown out the maintenance men inspect each part of the apparatus separately, clean the machine, interlocks and relay contacts, and go over all nuts and terminals on the back of the switchboard to see that everything is clean and making good contact. All protective devices are next tried out to be sure that they are working properly. This is done by starting up the machine but not letting it go on the line. The inspector then operates each protective relay or electric interlock by hand in the same manner as they would operate normally.

After all these protective devices have been thus tested out, all line and control switches are closed so that the machine may come on the line normally. The time required for two men to clean and inspect a one-unit station is about 6 hours. This allows plenty of time for the station to be back on the line in time for the evening peak load.

The Des Moines City Railway was among the first to install automatic controlled substations exclusively for city railway power, having begun in the year 1916 and continued with this work until the entire system is now fed from this source. At the same time the Des Moines & Central Iowa Railroad began to use automatic controlled substations for interurban service. Up to the present time the Des Moines City Railway has 10 and the Des Moines & Central Iowa Railroad has 5 substations operated by automatic control. These rotary converters range from 300 to 750 kw. each. The Des Moines City Railway was also among the first to build a portable substation automatically controlled. This station is of 500-kw. capacity and the equipment is installed in a steel car. The power transformer is designed for 4,500 or 22,500 volts as the city transmission lines operate at 4,500 volts, while the transmission lines feeding the substations for the Des Moines & Central Iowa interurban system use 22,500 volts. Two sets of operating and instrument transformers are needed for the different voltages. The time required to change the station from 4,500-volt to 22,500-volt operation is about 4 hours. This arrangement makes this portable substation very handy in case of trouble with either a city or an interurban station.

Data on the efficiency of automatic substations, and a comparison of the relative economy of automatic and hand-controlled stations, are furnished by the following figures for one year:

OUTPUT AND CONVERSION LOSS OF AUTOMATIC SUBSTATIONS, DES MOINES, IOWA.

Location	Substation Capacity Kw.	Annual D.C. Output Kw.-Hr.	Conversion Loss Per Cent
City Lines			
12th and High Streets	500	1,884,700	10.77
E. 2nd and Walnut Streets	500	2,435,150	8.66
Interurban Lines			
Brennan	300	197,080	22.01
Hyperion	300	240,320	23.45
Interurban Lines, Hand-Operated			
Mitchellville	300	235,420	37.45

The last two stations both having the same kilowatt capacity showed a difference in d.c. output of 4,900 kw.-hr., but a difference in conversion loss of 14 per cent for the period of one year. Aside from the saving due to the low conversion loss there was the additional important saving resulting from the elimination of operators in the automatic stations.

Comparison of the costs of operating the same single unit 750-kw. station automatically and by hand for a period of a year as taken from our operating data shows the following results:

	Hand Operation	Automatic Operation
Conversion loss, per cent	22	12
Conversion loss, kilowatt-hour	475,000	259,000
Loss at $0.0125 per kilowatt-hour	$5,712.50	$3,237.50
Maintenance labor, materials and supplies	450.15	450.15*
Wages of three operators working 8 hours per day at 50 cents per hour	4,380.00	
Total operating cost per year	$10,542.65	$3,687.65
Saving from automatic operation		$6 855.00

* Taken at actual cost of hand station.

Conversion losses in per cent for two-unit automatic substations, taken from actual records for a period of 6 months, were as follows:

	Machine No. 1	Machine No. 2
Station at 12th and High Streets, loss, per cent	5.47	7.15
Station at 2nd and Walnut Streets, loss, per cent	8.81	5.06

Under conditions where the leading machine is carrying light load part of the time, and the trailing machine comes on the line during the peak only, when it is not subject to light load conditions, the leading machine naturally shows the highest proportional conversion loss. This condition does not exist when the two machines are more uniformly loaded.

Comparison of inspection and cleaning costs for nine automatic substations of 500-kw. capacity each operated by the Des Moines City Railway shows the following results for one year:

	Total Cost for 9 Stations	Av. Cost per Station
Inspection and cleaning labor	$1,623.96	$180.44
Maintenance labor	2,238.76	248.75
Supplies, including brushes for machines, rags, oil, fuses, aluminum arrester electrolyte, sweeping compound, floor brooms, etc	885.62	98.40
Maintenance materials and parts	927.05	103.01
Totals	$5,675.39	$630.60

The use of automatic substations in Des Moines has not only proved economical from the standpoint of operation and maintenance costs, but, due to the fact that an operating force is not required, has permitted the use of more stations giving more feed-in points on the system. This increased number of feed-in points has reduced the amount of d.c. feeder necessary and has resulted in providing a very uniform trolley potential throughout the system, permitting higher schedule speeds and lower power losses.

For interurban service automatic substations can be located along the line where it would not be convenient to use the hand-operated substation, as some companies find it necessary to locate hand-operated stations near points where they can furnish living quarters for the attendants.

Subways in the Air

Taking as his subject "Traffic and Transit," Mayor Hylan of New York City addressed a joint meeting of the American Society of Civil Engineers and the American Society of Mechanical Engineers on Nov. 19. He told how under his administration the city had spent huge sums of money for the purchase of street cleaning equipment and praised the efficiency of the New York Fire Department. Incidentally, he repeated his well-known ideas on the benefits that would result to the city from the removal of "worn-out" street railway tracks, "antiquated" elevated structures and the inauguration in their stead of a swiftly moving "modern bus system."

He spoke in glowing terms of the benefits which resulted from the removal of the elevated spur on upper Sixth Avenue and prophesied the early removal of the rest of the elevated railway in that street. To care for the present traffic he wants the much-discussed Sixth Avenue subway to be built by the city. The Board of Transportation is now working on plans to accomplish this. No intimation was given, however, as to how it is proposed to construct a new subway at Thirty-fourth Street, where three underground lines at different levels are already in existence, nor where the money is to come from to carry out the city's ambitious projects.

Following the talk by Mayor Hylan,

---

[*] Abstract of a paper presented before midyear meeting of Iowa Electric Railway Association, Des Moines, Nov. 13, 14, 1924.

Fire Chief John Kenlon told how the construction of elevated railways in various parts of the city had destroyed property values. He expressed the opinion that no more such structures should be built. The difficulty of moving fire apparatus through the congested streets was also mentioned by this speaker.

Major Elihu Church, transportation engineer Port of New York Authority, in a snappy talk told of the growing popularity of horse-drawn vehicles for heavy trucking in New York City. He cited actual counts showing more than 70 per cent of the vehicles carrying freight to and from certain terminals being drawn by horses. The proportion is steadily increasing, he said. Time, not distance, being the measure of expense in heavy trucking, the superiority of the cheaper vehicle is notable where congestion exists. With the average speed of traffic movement in the city streets being from 3 to 4 m.p.h. and with one-half to two-thirds of the time of the truck spent standing still, it is more economical to use horses. Major Church explained how a system of trunk line motor highways and bypasses around cities would relieve this severe congestion.

Utilities Commissioners Discuss Bus Regulation

THE annual meeting of the National Association of Railroad & Public Utilities Commissioners was held at Phoenix, Ariz., Nov. 11-15. Most of the time of the meeting was given over to discussion of matters not especially pertinent to electric railways. The new president elected was William D. B. Ainey, chairman of the Public Utilities Commission of the Commonwealth of Pennsylvania, who is well known in electric railway circles, as he has several times addressed the American Electric Railway Association. James B. Walker of New York was elected secretary.

J. N. Shannahan, president of the A.E.R.A., addressed the commissioners, primarily on the subject of proper regulation of the motor bus and motor truck. Mr. Shannahan's address was published in this paper last week. It was enthusiastically received at the convention. One of the members stated that Mr. Shannahan had given some very helpful suggestions on one of the most pressing problems of the day. He also suggested that the commissioners' association should give more attention to this subject, that not enough study and discussion had been given the report of the committee on motor vehicle transportation presented last year, and urged that the commissioners devote more attention to this important subject during the ensuing year.

Among resolutions passed by the convention on the subject of national legislative matters was one of interest to the electric railways. This was "that Congress be respectfully urged to make such amendments to the existing (transportation) law as shall clearly exclude from the jurisdiction of the Interstate Commerce Commission the regulation of rates and service of electric railways carrying on local street railway transportation."

A report of particular interest to electric railway men was that of the committee on motor vehicle transportation, an abstract of which follows:

REPORT OF COMMITTEE ON MOTOR VEHICLE TRANSPORTATION

The fees thus far required in the various states from auto transportation companies may be roughly divided into three classes: (1), fees applied toward the expense of regulation; (2), fees of the nature of compensation for the use of public highways; (3), fees exacted in exchange for franchise rights.

Fees to Cover Regulatory Expense.—The committee believes that the exaction of fees to cover the expense of regulation is sound in principle. The regulation of motor vehicle transportation is more expensive in proportion to its volume than is the regulation of other kinds of transportation, and the benefits from efficient regulation accrue more directly to the persons engaged in such enterprises. The auto transportation companies, as a rule, do not object to the payment of reasonable fees when they feel that they are getting value received in the form of fair and efficient regulation.

Fees or Taxes to Cover Road Construction and Maintenance.—Motor vehicle transportation is in a class by itself in respect to the roadbed or way over which its vehicles operate. Steam and electric railroads are required to purchase rights-of-way, construct roadbeds, lay ties and steel, and maintain such structures at their own expense, and in addition thereto, pay taxes thereon.

Motor vehicles operate over highways constructed by the public, and as long as no compensation for the use of such highways is exacted of auto transportation companies, they are indirectly subsidized at the expense of the public. It would be manifestly unjust, however, to exact fees from auto transportation companies subject to regulation, without at the same time exacting similar fees from all vehicles making commercial use of the highways. Most of the states which have statutes regulating auto transportation apply them only to stages and trucks operating between fixed termini and over regular routes. By amending statutes covering the regulation of auto transportation companies operating between fixed termini and over a regular route so as to create and regulate a new class of auto transportation companies embracing practically all other vehicles using the highways for commercial purposes, they could be brought under some form of regulation and could be required to make reports upon which equitable fees could be based. As a general rule trucks used by private industries in the transportation of their own products, which are not operating for hire in a strict sense, are more heavily loaded and do more damage to the highways than those of any other class. Yet they are in a position most likely to escape fees or taxes exacted as compensation for the use of the highways, except the gasoline tax.

Gasoline Tax.—A large number of states are now exacting a gasoline tax, amounting to either 1 or 2 cents per gallon in most instances. This form of tax operates equitably upon all users of the highways in proportion to the use they make of the same. It is the only tax yet devised which is fair and equitable to all. Objection to the gasoline tax on the ground that it falls equally upon those who use the highways for pleasure and those who use them for profit, is answered by the suggestion that those who use the highways for pleasure should be willing to contribute their just quota toward building and maintaining the highways. Pleasure cars are usually lighter and the mileage less than with commercial vehicles, so the amount paid by their owners is much less. It is estimated that, in the state of Washington, for instance, the amount contributed by stages in license money and gasoline tax will average about 60 per cent per mile of travel more than that contributed by private cars. In any fee system involving vehicles using the highways, the gasoline tax should be a part of the system, and additional taxes might reasonably be imposed from those making commercial use of the highways.

Other Forms of Taxation.—Other forms of taxation designed to compensate for the use of highways and for the protection which the certificate of public convenience and necessity affords includes the gross operating revenue tax and wheelage or mileage tax. The states of Washington, California and South Dakota require, in addition to the fees imposed upon all other motor vehicles, a gross revenue or gross earning tax. In Washington, under the present law, this fee cannot exceed 1 per cent, and is designed for the sole purpose of covering the cost of supervision and regulation. In California, the amount imposed is 4 per cent of the gross receipts, less the amount paid as municipal fees and taxes. In South Dakota, the tax is 2 per cent of the gross, in addition to motor vehicle tax and personal property tax. In the state of Washington, this tax amounts to approximately $50,000 per year. In South Dakota, the tax is represented as yielding about $4,000 the first year, with prospect of considerable increase in later years. In California, the 4 per cent gross revenue tax yielded for the first quarter about $100,000. It is expected to produce at least $125,000 per quarter or $500,000 per year.

Flat Fees.—Alabama, Arkansas, Colorado, Connecticut, Florida, Georgia, Illinois, Indiana, Michigan, Minnesota, New Jersey, New York, North Dakota, Ohio, Oregon, Pennsylvania, Tennessee, Texas, Wisconsin, and the District of Columbia have widely varying flat fees, based in most instances on the passenger seating capacity as applied to passenger cars and on weight or capacity as applied to freight carrying trucks. This form of taxation is so new that the committee was unable to secure information regarding experience with this form of tax or its desirability.

Wheelage Tax.—Other states, including Iowa, Maryland, Oklahoma, Virginia and West Virginia, impose certain taxes based upon ton-mileage. There is a wide variation, both in the method of computing the tax and in the amount of the tax imposed. In Iowa, the tax for motor vehicles having pneumatic tires is ⅛-cent per ton-mile of travel over and along the public highways. For motor vehicles having hard rubber or solid tires, the tax is ¼ cent per ton-mile. The statute also includes the method of figuring the ton-miles of passenger travel, the passenger weight being taken at the full seating capacity figured at 150 lb. per passenger, plus the weight of the vehicle, multiplied by the number of miles operated, which, however, cannot be considered as less than the number of miles required to maintain the schedules filed. When figuring ton-miles of freight travel, the freight carrying capacity of each truck or unit, including trailers, plus the weight of the vehicle, is used in calculating the ton-miles. The Iowa law applies to persons or corporations operating a motor vehicle for delivering merchandise other than farm products, except those operating wholly inside of city limits, as well as passenger and freight carriers operating for compensation over their regular routes or between fixed termini. The amount of revenue from this tax for the year ending July 4, 1924, was estimated at $50,000.

In West Virginia, passenger carriers operating over regular routes, where the vehicle weighs less than 3,000 lb., are required to pay 1/20 cent for each passenger seat-mile; over 3,000 lb. and less than 7,000 lb., 1/15 cent per passenger seat-mile; and over 7,000 lb., ⅒ cent per passenger seat-mile. Property carriers over regular routes pay for a capacity of 3 tons or less ⅒ cent per ton-mile; over 3 tons and less than 5 tons, ⅙ cent per ton-mile. Passenger carriers not running over regular routes or between fixed termini pay a flat rate of $75 yearly. Property carriers under the same condition pay a fee double that of trucks not used for hire. The above law became effective on July 27, 1923, and the revenues collected thereunder up to June 30, 1924, were approximately $306,000. A feature of the law is that vehicles operating over a regular route are required to pay the full year's tax in advance.

No Special Taxation Imposed in Some States

Some states, such as Michigan, Nevada, New Hampshire and Vermont, impose no state tax other than the ordinary fees required of all motor vehicles, but the various counties and other local subdivisions are permitted to impose certain fees in widely varying methods and amounts. The committee believes that such a system is wrong in principle and is illogical and inequitable. All fees should be uniform throughout the state and should be collected by state agencies, with the possible exception of a municipal fee for vehicles operating wholly within city limits.

Arizona, Delaware, Kansas, Kentucky, Mississippi, Missouri, Nebraska, South Carolina, Utah and Wyoming impose no taxes or charges upon auto transportation companies or vehicles other than those applicable to all other motor vehicles, unless such legislation has been very recently enacted.

In the discussion by correspondence between the various members of the committee, it was suggested that the mileage tax or other fees exacted should be based somewhat upon the character of roads over which the operation is conducted. After considerable discussion, it was agreed that it was impracticable to base a tax upon the type of road traversed.

George H. Pride, president of the Heavy Haulage Company of New York City, speaking on the subject of cost accounting in highway transportation operation not long ago, made this statement:

The Public Pays the Cost of Motor Transportation

"The public as a whole pays for the construction and maintenance of the highways in the form of taxes, and, although it is not generally realized, it also defrays the entire cost of the motor truck transportation which passes over the highways in the price for the commodities it buys, for it can be unqualifiedly stated that practically everything purchased has been transported by motor truck one or more times during its process of fabrication."

Mr. Pride also states that eleven times as much money is spent in operating motor trucks over the highways yearly as is spent in building the highways themselves.

In imposing taxes upon motor vehicle operation in any state, careful consideration should be given to existing statutes, so as to avoid pyramiding taxes to the injury of motor transportation and ultimately to the inconvenience of the public. In the state of Washington, for instance, the stage is subject to regulation by paying $56,522 a year license money and about $35,000 per year gasoline tax, or $91,522 per year for the use of the highways. The trucks, subject to regulation, pay about $25,000 per year license money and about $15,000 per year gas tax, or about $40,000 per year for the use of the highways. The same stages pay about $65,000 per year and the trucks $25,000 per year personal property tax. Thus it is seen that the stage is at present operating under regulation by paying to the state under the various statutes about $220,000 annually besides the gross operating revenue tax of 1 per cent, designed to cover the expenses of regulation, which amount to approximately $50,000 per year. The total for the state of Washington, $270,000 per year, is equivalent to about 5.4 per cent of the gross operating revenue of auto transportation companies. No doubt similar situations exist in other states.

In California, the license fee is a flat sum of $3 per year against an average license fee in Washington for stages of $91.74 and an average fee for the type of trucks used by auto transportation companies of about $77.50. In California, all municipal fees and taxes are deducted from the gross revenue tax. It is doubtful if the auto transportation companies of California pay a greater per cent of their gross revenue under the 4 per cent law than is required of such companies in the state of Washington under the various tax and license provisions of that state.

Seven General Principles Proposed for Taxation

At present the time of operation under the various laws has been so short that it is impossible at this time to determine, from the standpoint of operation and experience, the most practicable and feasible method of taxing auto transportation companies. The announcement of a few fundamental principles, the committee believes, should be helpful in the enactment of any fee statute.

1. A reasonable gasoline tax should be imposed, applicable to all vehicles using the highways.

2. All taxes imposed upon motor vehicle common carriers should be imposed and collected by the state, with a possible exception of city taxes upon vehicles operating wholly within the city limits.

2. An equitable franchise tax might properly be imposed upon vehicles operating between fixed termini and over a regular route under certificates of public convenience and necessity, to the exclusion of vehicles not so operating.

4. Taxes or fees on motor vehicle common carriers, the proceeds of which are limited to the construction and maintenance of highways, should be imposed upon all stages, trucks and "for hire" cars, whether operating between fixed termini and over a regular route or otherwise, or whether operated for hire or by private industries in the transportation of their own commodities.

5. In states where the imposition of fees and taxes would cripple or destroy small stage or truck operations rendering useful service in sparsely settled communities, any revenue tax imposed should apply only to revenues over and above a reasonable return to the motor vehicle carrier.

6. Statutes which provide for the regulation of auto transportation companies operating over regular routes and between fixed termini should be amended so as to include motor vehicle common carriers not so operating; but in any case fees for the use of the highways, whether flat or in the form of mileage tax or revenue tax, should apply to all motor vehicle common carriers, whether subject to regulation or not.

7. Any new or supplementary fee or tax statute should take into consideration all fees and taxes paid under existing laws, so that the total for any one purpose or as a whole shall not be unjust, unfair or unduly burdensome.

The report was signed by E. V. Kuykendall, chairman; T. E. McKay, Fay Harding, Gen. J. F. O'Ryan, Ivan Bowen, J. F. Harper, O. W. Rugh, H. V. Osborne and G. R. Shelby.

Southwestern Association Convention at Houston Next May

THE executive committee of the Southwestern Public Service Association, at a recent meeting, set the 1925 convention of this association for Houston, Tex., May 19-22. W. E. Wood, Houston, heads the convention committee.

New York State Dinner on Jan. 22

THE New York State Railway Association will hold its next convention in New York City on Jan. 22 at the Commodore Hotel. There will be a morning and an afternoon session and an informal dinner in the evening.

American Association News

Executive Committee

THE executive committee of the American Association met in New York on Nov. 21, with the following members present: President J. N. Shannahan, R. P. Stevens, W. H. Sawyer, L. H. Palmer, R. I. Todd, F. R. Coates, A. W. Brady, L. S. Storrs, C. E. Morgan, T. C. Cherry, C. H. Clark, W. L. Davis, M. B. Lambert, E. P. Waller, B. A. Hegeman, Jr., C. S. Hawley, A. A. Hale and Secretary Welsh.

R. P. Stevens, chairman of the finance committee, presented the annual audit of accounts, which was accepted. He also presented the budget for 1926, which anticipated receipts of $321,000 and expenditures of $318,000. This was approved. An appropriation of $2,500 in support of the street and highway safety program of Secretary of Commerce Hoover was approved.

Mr. Coates reported briefly for the policy committee. He was authorized to draw up a resolution giving the indorsement of the association to the work of the Better Business Bureau and the National Vigilance Committee, and urging co-operation of member companies with these organizations in their own cities. The committee on policy was also instructed to draw up a statement expressing more definitely the position of the association with respect to the motor bus. Similarly, the question of proper regulation of interstate highway carriers was referred to the committee on national relations.

A communication from Gen. Guy E. Tripp, chairman of the Committee of One Hundred, was read, which requested a termination of this committee's activity on Jan. 1, 1925, in view of the fact that the association is now financially able to carry on this work on the same scale. This action of the Committee of One Hundred was recorded and President Shannahan directed to write a letter on behalf of the executive committee to General Tripp, thanking the Committee of One Hundred for the splendid work it has done in the interest of the association and of the industry.

At the suggestion of President Shannahan and on motion of Mr. Sawyer, the president was authorized to appoint an advisory council of the association, whose membership will be made up of the principals representing ownership of electric railway properties. The function of the advisory council will be to carry on the work formerly done by the Committee of One Hundred and such other matters as it may consider desirable to act upon. President Shannahan expressed the thought, reiterated by Mr. Sawyer, that the American Electric Railway Association has not had the co-operation of the owners of the properties to the extent desired. It was felt highly desirable to create some arrangement which would bring to the association the benefit of their interest and active support.

Mr. Palmer reported for the committee on company and associate membership that one railway had applied for membership, this being the Bamberger Electric Railroad Company, Salt Lake City, Utah. Bonbright & Company, investment bankers, New York, had applied for associate membership. These applications and those for twelve manufacturer members were approved.

Mr. Morgan reported for the company and community section and individual membership committee. The main point of interest was that the membership of the Metropolitan Section in New York has now reached 693. Mr. Morgan spoke briefly of the great interest shown in the meetings of this section and also of the fact that many of the members had shown a new interest in industry problems as a result of attendance at the first two meetings.

Mr. Clark, president of the Engineering Association, asked for and received the approval of the executive committee, to invite certain railway companies to send engineers as members of a committee which will make a special study of the causes and cure for rail corrugation. This committee will make a tour of inspection of the conditions on a number of properties. Each company will be requested to pay the expenses of its own representative and a portion of the expense of the secretary of the committee, who will probably be a professor of some university which takes an active interest in electric railway matters. This secretary will compile the report. Mr. Storrs for the Connecticut Company, Mr. Morgan for the Brooklyn City Railroad, and Mr. Emmons for the Baltimore company, agreed to send a man on this trip and Mr. Clark was authorized to send out his letters inviting other companies to do likewise.

In the absence of J. P. Barnes, Secretary Welsh read the report of the committee on public relations. This will appear in next week's issue of this paper.

Mr. Sawyer reported the recommendation of the committee on location that the Midyear Meeting be held at Washington on Tuesday, Feb. 17. This was approved.

President Shannahan spoke on the fact that the lease on the headquarters office expires shortly and that the association will have to face a considerable increase in rent as the present lease was made 10 years ago. On motion he was authorized to appoint a committee consisting of the chairman of the finance committee, Mr. Stevens, the chairman of the policy committee, Mr. Coates, himself, and such other members as he may direct, to consider this matter and with power to act.

On motion the president was authorized to appoint a committee on customer ownership, the suggestion having been made in a letter from Past-President Britton I. Budd.

Mr. Coates read a report on the American committee on inductive coordination and requested an appropriation of $250 to support the work of this committee. This was approved.

A letter from C. L. Van Auken, vice-president and managing editor *Electric Traction*, was read requesting President Shannahan to make a place on the program at next year's convention for the award of a certificate of merit and a silver cup to the company showing the highest operating speed and asking him to make the award. The president was instructed to thank *Electric Traction* for the spirit and motive behind the suggestion but to disapprove it.

As a matter of information, Secretary Welsh pointed out that the National Industrial Conference Board is now engaged in making a study of the weekly earnings of public utility employees. One of the executives stated that executives in other industries are beginning to ask why street railway wages are going up while all others are going down. This trend is putting the electric railways in an unfavorable light among other industries.

The next meeting will be held in New York on Wednesday, Jan. 7.

Location of Midyear Meeting

"AT WASHINGTON, Tuesday, Feb. 17" were the place and date selected by the committee on location at its meeting in New York, on Nov. 20, for the Midyear Meeting and dinner of the American Electric Railway Association. Members of the committee present were Chairman W. H. Sawyer, President Shannahan, Charles Castle, A. A. Hale, S. J. Cotsworth, J. H. Hanna, E. P. Waller, E. C. Faber, Harry L. Brown and Secretary J. W. Welsh.

The committee also discussed the question of the location of the annual convention next fall and whether or not there should be exhibits. Mr. Brown reviewed to the committee the wishes expressed by some 40 manufacturers in various parts of the country. The expression of these manufacturers was almost unanimous in favor of having exhibits with the convention.

Young's Pier in Atlantic City is becoming increasingly inadequate for the electric railway exhibition and a sub-committee was, therefore, appointed to make a thorough investigation as to a more suitable location and also to determine whether any improvement in facilities at Atlantic City may be possible. This sub-committee will report back to the main committee at the time of the Midyear Meeting in Washington.

Maintenance of Equipment

Overhead Rail for Handling Armatures

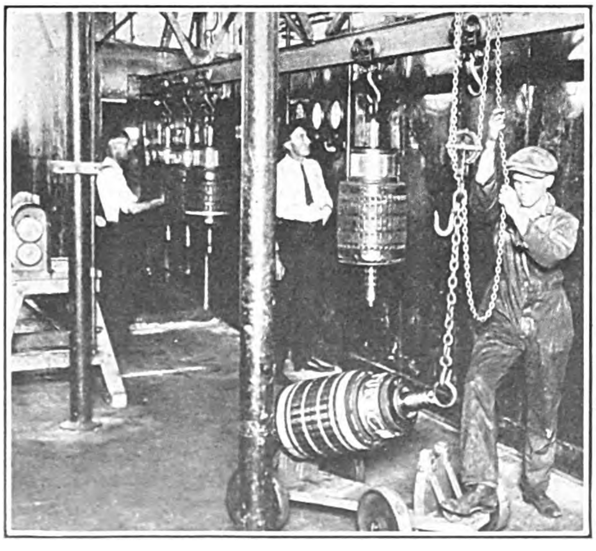
By J. G. Jeffery

Director of Public Relations Los Angeles Railway, Los Angeles, Cal.

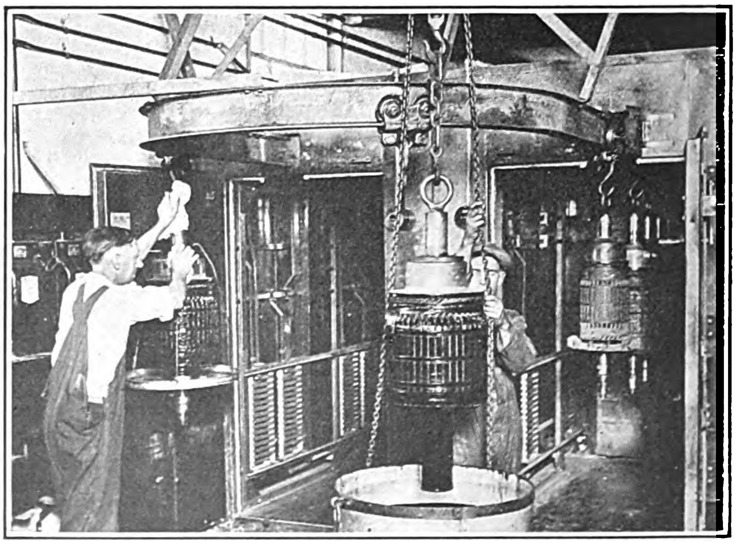
The use of an overhead rail for moving armatures in and out of the new preheating and electric baking ovens at the shop of the Los Angeles Railway is proving a great time and labor saver as well as providing a more convenient method than the use of trucks for rolling these armatures about. The overhead rail extends for a considerable distance in front of the preheating oven. Armatures are hoisted to the overhead rail and are suspended from carriages which travel on the rail, which extends entirely through the oven. They are preheated for 12 hours at a temperature of 205 deg., after which they are pushed out the opposite end of the preheating oven, which has a semi-circular extension of the overhead rail. On this end the armatures are dipped in insulating varnish. A tray is placed underneath to catch the drippings, and the armature with the tray attached is then pushed into the baking oven, where it is kept at a temperature of 195 deg. for 48 hours.

At present the armatures are dipped by lowering them into a stationary tank, but the company is considering building a tank for the insulating varnish with provision so that it can be lifted by an air hoist. With this arrangement it will be unnecessary to remove the armatures from their hooks on the carriages for dipping.

The method used for holding the armatures suspended is of interest. A hole is bored into the end of the armature shaft and tapped out so that an eyebolt can be quickly screwed into the end of the armature shaft which is to be handled. It can then be hoisted by the chain hoist from the floor or from trucks. When raised to the height of the rail it is transferred to the carriage, which has a hook to fit the eyebolt.



Hoisting Armatures to Overhead Rail After Eyebolts Have Been Screwed Into Armature Shaft. They Are Then Pushed Along Rail Into Preheating Oven.

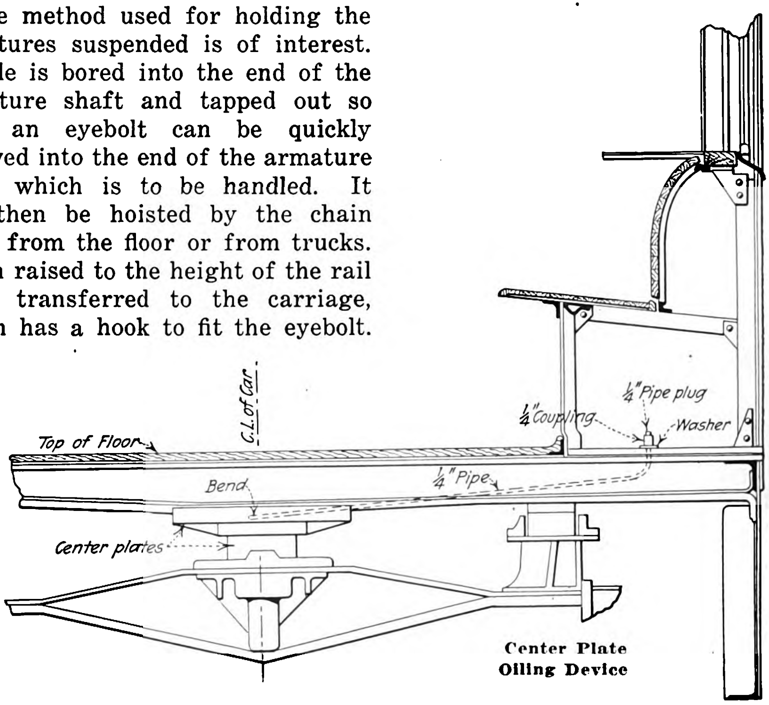


At the Right an Armature Is Being Hoisted from the Dipping Tank. The Armature at the Left Is Being Pushed Into the Baking Oven After A Tray Has Been Placed Underneath to Catch the Drippings

Convenient Method of Oiling Center Plates

It is extremely difficult to oil center plates on most types of car, and as a result the greasing or oiling at this point is frequently neglected. The Boston Elevated Railway experienced difficulty in getting the center plates apart. In order to overcome the trouble, it has installed oiling pipes as shown in the accompanying illustration. These are now being used on all of the Main Line rapid transit type cars.

The device consists of a ¼-in. wrought-iron pipe, bent to proper shape and leading from underneath one of the longitudinal seats to the center plate at that end of the car.

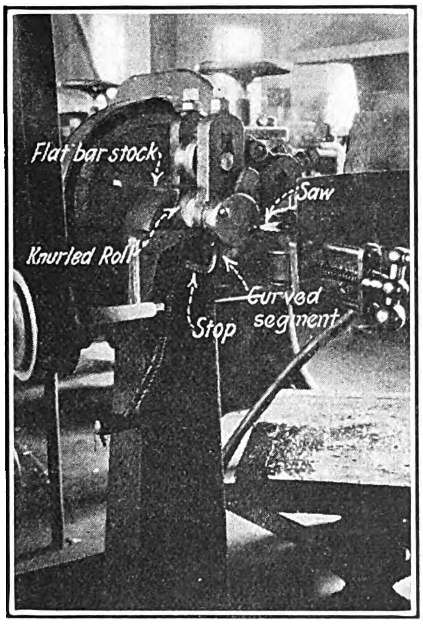


Center Plate Oiling Device

The lower or center plate end of the pipe fits tightly in a hole drilled in the center plate. The end underneath the seat is fitted with a standard ½-in. coupling and with a plug on top. When oil is placed in the pipe it works its way down to the cored chamber in the body of the center plate. From this point it passes through a small hole to the bearing surfaces of both plates. The present method consists of adding oil about once each month and the installation of these devices has entirely eliminated the trouble previously experienced.

Making Controller Segments from Flat Stock

A SPECIAL machine designed and built by the mechanical department of the Twin City Rapid Transit Company enables this company to make controller cylinder segments for repair work, out of flat bar copper stock by an automatic and semicontinuous process.

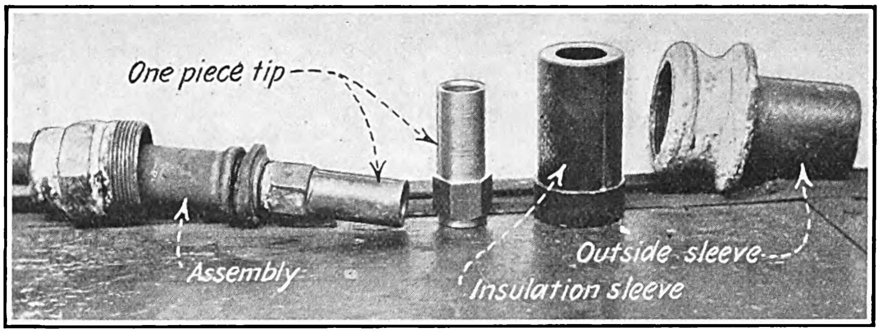


Controller Segments Are Formed from Flat Bar Stock in This Special Machine Developed by the Twin City Rapid Transit Company

The flat bar copper is fed into the machine between a pair of power-driven rolls, one of which is knurled, so that it grips the stock and forces it through. A third roll at the back of the machine guides the bar, so as to form the segment of a circle. This segment can be formed to any desired radius, within certain limits, by adjustment of the position of the roll. In the illustration the curved strip of copper is shown below, after it has passed through the machine.

An automatic trip stops the machine when the end of the bar makes contact with it. By setting the trip in any desired position, the machine is stopped when a predetermined length of segment has been rolled. The horizontal saw, which is shown at the extreme right of the illustration, is then operated by the hand feed, and cuts the rolled segment off to the proper length. Another segment is then rolled and the operation repeated.

Improved Bus-Line Jumper



Assembly of Bus-Line Jumper Cable Includes Solid Connector Tip in Place of the Two-Piece Tip Formerly Used

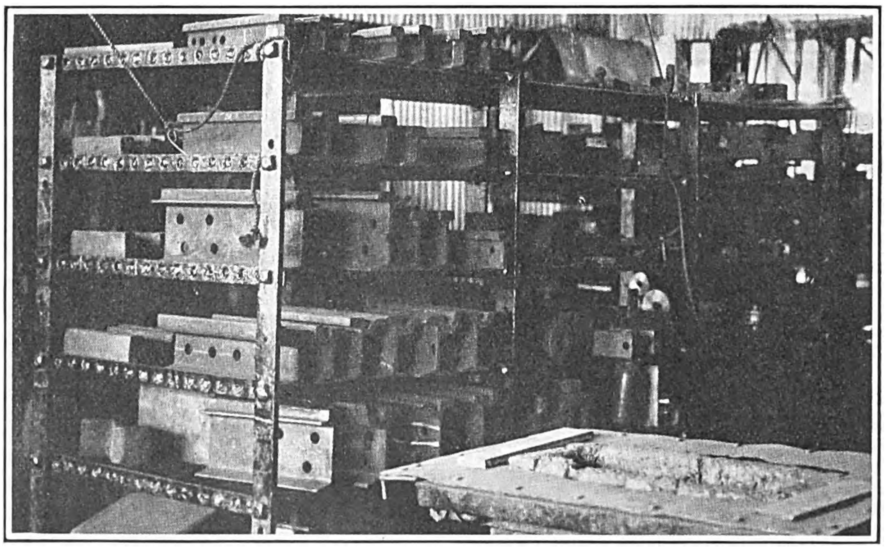
AN IMPROVED bus-line jumper connection has been devised at the Wheaton shops of the Chicago, Aurora & Elgin Railroad. This design eliminates the possibility of the connection burning away due to excessive arcing. The standard type of jumper used had a two-piece threaded contactor receptacle. One end was soldered to the jumper cable and the other end received the spring prong attached to the car. Although the object of this type of connector is to facilitate the changing of this latter part in case it becomes badly burned, it has led to difficulty, because a trainman in breaking the connection is apt to give the jumper a twist tending to unscrew the receptacle from the fastening on the cable end.

To eliminate the possibility of this occurring, a new design of connection was perfected. This consists of a solid brass piece taking the place of the two pieces previously used. It is fastened to the cable jumper and has sufficient brass between the jumper and the connector plug so that any heat of arcing will be dissipated sufficiently to leave the solder unharmed. The new brass plug fits into the standard insulation provided for the two-piece plug, and in every way answers the purpose of the two-piece plug with the exception of ease of renewing the end tip. It is found, however, that this one disadvantage is greatly offset by the desirability and permanency of the connection between the jumper cable and the connector tip.

Collecting Sample Rail Sections for Forge Shop

BY J. L. ROGERS
Forge Shop Foreman Kansas City Railways

THE forge shop of the Kansas City Railways is called on to make up various parts for use in



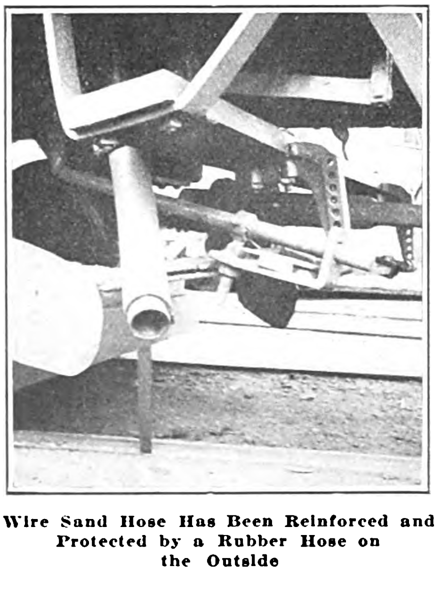
Stored Conveniently in a Special Rack, These Sample Sections of All Rails In Use in Kansas City Enable the Forge Shop to Check Track Parts by Fitting Them to the Actual Sample Piece of Rail trackwork. Among other things, the making of compromise plates runs into a considerable volume of work.

As the practice on the system has been revised from time to time, various forms and sizes of rail sections have been used. This has made it very important that orders for plates be carefully checked in order to make sure that they are properly made to fit the different rail sections.

Short sample lengths of rail are maintained in an appropriate rack where they are always accessible, and are not allowed to leave the forge shop. Each piece is known by its section number, and when forging work such as the making of joint plates is to be started for any particular section of rail, the workman can always check with a piece of rail of the proper section, to make sure no error has been made in the selection of the proper die before a large quantity of material is made up. In addition, any other questions regarding the correctness of forging work for the track department can always be checked by fitting to the actual rail sections in the shop.

Rubber Cover Prolongs Life of Sand Hose

SOME time ago trouble was experienced by the Eastern Massachusetts Street Railway on account of moisture getting into the sand boxes of its cars and interfering with the proper flow to the rail. Wire hose was at that time in use for the outlets from the sand boxes. In service the wire hose had become somewhat damaged and bent, however, further interfering with the flow of sand. It was then decided to slip a piece of rubber hose over the wire hose, thus at the same time effectually closing the openings through which moisture was entering and straightening out the pipe. This arrangement is shown in an accompanying illustration. In the photograph the rubber covering has been pushed back slightly in order better to illustrate the arrangement. In reality the rubber and wire hose are of the same length. This procedure has resulted in making the flow of sand more reliable.

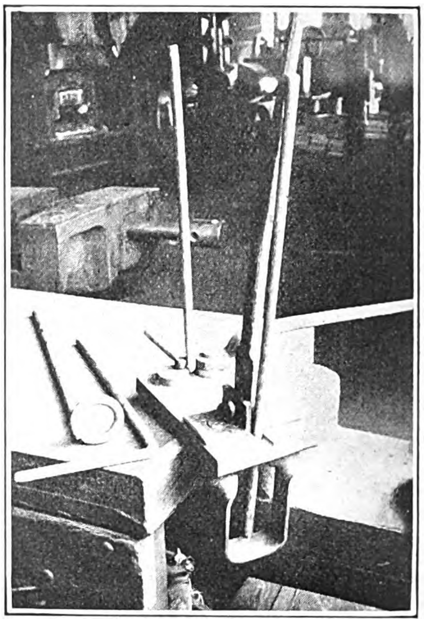


Wire Sand Hose Has Been Reinforced and Protected by a Rubber Hose on the Outside

Die for Forming Sand Hose Brace

MANY operations in the forge shop lend themselves readily to the use of simple dies that effect comparatively large savings in time and labor. A device of this type is represented by the die shown in the accompanying illustration, which was developed by the mechanical department of the Twin City Rapid Transit Company for forming sand hose braces from round bar stock.

Two operations are necessary in order to form the circular loop at right angles to the supporting rod, as shown by the completed brace lying on the bench in the illustration. The first operation consists simply of making a right-angle bend in the piece. This is done by the vertical lever at the front of the die in the illustration. The condition of the piece at the end of this operation is shown by the sample.



This Simple Tool Speeds Up the Work of Forming the Sand Hose Brace Shown at the Left, from ⅝-In. Round Bar Stock

After the bend is made the piece is set between two rollers, as shown at the rear of the illustration. A lever having a hook at one end is set over a pin projecting through one of the rollers, and by rotating this lever in a counter-clockwise direction, the piece of work is forced between the rollers so as to form the loop on the end. This brace is made of ⅝-in. round stock in one heat.

New Equipment Available

Fire-Fighting Machine Perfected

A 40-GAL. portable foam chemical engine has been developed which uses the principles of operation employed by the Foamite system of the Foamite-Childs Corporation, Utica, N. Y. The new engine has substantially the same outward appearance as the type previously used, but the internal construction has been redesigned. With this new meter-type engine, a medium pressure is generated at the start, which gradually decreases during the period of effective discharge. The volume of firefoam generated is almost double the quantity delivered by the old type engine from the same quantities of chemical solution. In addition, the quality of the foam produced is superior to that of the old. Extensive tests have been made by the manufacturer with the new engine, and it has been submitted and approved by the Underwriters' Laboratories as effective on both class A and class B fires.

Pressed Steel Forge Hearth

A ONE-PIECE hearth, 24 in. x 36 in., constructed of heavy gage pressed metal, has been brought out by the Buffalo Forge Company, Buffalo, N. Y., for its standard line of forges. This new pressed metal hearth takes the place of the cast-iron construction previously used. Advantages claimed for the pressed steel hearth are elimination of rust, decreased weight and improved appearance. Breakages of the cast-iron type, which occurred frequently, cannot occur with the new construction.

The News of the Industry

Necessity for P. R. T. Revaluation Up to Expert

The Pennsylvania Public Service Commission, at its meeting in Harrisburg, on Nov. 17, formally requested Milo R. Maltbie, public utility expert, to determine whether a revaluation of the Philadelphia Rapid Transit Company property was necessary. The commission decided that upon his decision would rest the question of reopening the revaluation proceedings. Mr. Maltbie said he would review the testimony in the former valuation case as well as a number of other questions involved, and added that his conclusions would be ready for the commission "sooner than many expected."

Following the meeting the commissioners made it clear that the inquiry by Mr. Maltbie would in no way interfere with the hearings in the P. R. T. higher fare case. They indicated that they would be ready to go on with hearings relative to the advisability of continuing the "temporary" 8-cent fare order which they recently issued when the Superior Court hands down its decision on an appeal taken by the city.

The question of the valuation was reopened by the recent opinion of Attorney-General Woodruff, who held that a real valuation of the P. R. T. property did not exist. In that statement he quoted an opinion of the Supreme Court, which stated that "an indeterminate valuation" was not an effective or legal valuation. This opinion written recently by Attorney-General Woodruff to W. D. B. Ainey, chairman of the Pennsylvania Public Service Commission, stated that the commission might legally make an investigation which would enable it to determine whether the valuation of the Philadelphia Rapid Transit Company property was necessary and proper in connection with the pending 8-cent fare case. The opinion did not specifically direct the commission to begin the work of valuation, but it practically indicated that the work could be undertaken. The document was written in reply to three brief questions of law submitted by Commissioner Ainey on Oct. 27 and suggested by Governor Pinchot.

Court Instructs Kansas City Railways to Submit Bus Plan

Judge Stone of the federal court at Kansas City, Mo., on Nov. 18 adjourned to Dec. 2 the final hearing as to the installation of bus service by the receivers of the Kansas City Railways. The receivers were instructed to hear all interested parties, including the civic bodies, and to prepare a report for submission on Dec. 2 embodying recommendations as to routes, type of equipment and investment required for bus service. The receivers have announced public hearings at the railway headquarters each day until Nov. 25.

Various interests, including attorneys and others representing creditors, attended the hearing on Nov. 18. They agreed to the general proposition that the installation of bus service by the receivers was necessary to protect the property from competition. These interests, however, reserved final consent until the extent of the installation and the amount of receivers' funds that would be used could be definitely ascertained. Meanwhile a decision is expected from Judge Van Valkenburgh of the federal court responsive to a petition by the receivers for an injunction against Moore and others operating a bus line in alleged violation of ordinances of Kansas City, Mo.

On Nov. 17 Judge Stone definitely instructed Prof. Harry Earl Riggs to proceed with the valuation of the property. Attorneys and others interested were heard, but no objection was raised except a general one from the attorney for personal injury claimants. He said he was opposed to any proceeding that might tend to delay a final settlement with his clients.

Proposes Extension of Public Control

Chairman of the Boston Trustees Urges Ten Years More Under the Present Arrangement—Other Suggestions Offered at Meeting Include "Customer Ownership" and Restoration of Five-Cent Fare, with Public Taxed for Deficit

JAMES F. JACKSON, chairman board of public trustees of the Boston Elevated Railway, proposes an extension of the time of public control of that company. He is of the opinion that the property will never be turned back to the stockholders, but that it will go from public control to public ownership.

Many other suggestions were made by various speakers before the members of the special legislative recess committee at a hearing held during the week ended Nov. 15. Some speakers suggested "customer ownership," others that the equipment should be privately owned but the structure should be owned by the public; there were suggestions that the 5-cent fare should be restored and the public taxed for the deficit, and that there should be more economy in the use of tickets.

The legislative committee is required to report on Dec. 15 what additional legislation ought to be enacted next year regarding the Boston Elevated.

A statement of the imperative needs for capital expenditures to improve the service of the railway was recently submitted to the committee by the trustees. It covered the completion of general repair shops at Everett, improved facilities at carhouses in Medford, in Arlington, in Brookline, and at Lotus place and City Point in Boston, additional boiler equipment at South Boston to make available the full capacity of that plant, underground conduits required by law, purchase of additional cars, lengthening of platforms at elevated stations, track betterments and miscellaneous additional tools and appliances, all aggregating $24,500,000. It was said at that time this program of improvement ought to be inaugurated at once and completed within ten years. It was pointed out that they mean practical economies, elimination of waste and safer and better accommodation for the riding public.

In his plea Mr. Jackson said that each item in that statement has since been re-examined for the purpose of making it conservative to the last degree. That examination led him to believe that the aggregate outlay can be reduced from $24,000,000 to $20,000,000, to be expended from time to time for purposes named by the Legislature and specifically supervised by the Department of Public Utilities. Mr. Jackson said:

> As the state policy prohibits the issue of stock at less than par value and prohibits the issue of bonds in excess of outstanding capital stock with premiums paid upon it, the trustees are facing and have faced during the past year an impassable barrier to the proper performance of their official duty.
>
> They therefore presented the situation to the Legislature, assuming that the Commonwealth in undertaking a trial of public control must have had in mind a genuine and satisfying test of the ability of public management to accomplish better results than private management is likely to secure in the conduct of this metropolitan service. They believe that no such test is possible without available capital for the purposes which have been named.
>
> The public control act informs investors that at the end of the ten contract years or at any time thereafter the Legislature may end this lease and return the railway to the lessee. It makes it plain, too, that after the ten years have expired the Legislature only can terminate public control. They may feel very sure that public control will continue indefinitely, but they realize the fact that there is always the chance that this expectation may not be realized; uncertainty prevents investment. To meet the situation the trustees have suggested the advisability of determining at this time whether or not public control under this lease between the State and the company is to continue beyond 1928. In doing this they have refrained from expression of opinion as to what the decision upon this fundamental question should be, believing it a legislative question and one upon which they should not be heard. Certain questions, however, have been asked which I desire to answer.

Mr. Jackson further said he thought the trustees agreed that if the present experiment in public control is to be given a full test there should be legislation to extend the period of ten years named in the act with preservation of the right of the State to take over the property at any time, with appointment of trustees by the Governor for the same term of office, one member to go out of office every two years and to be ineligible for reappointment, and with generally the provisions for administration of affairs that are now found in the public control act.

He also said that the trustees agreed in the belief that this property will never be returned to stockholders; that any change from public control will be to full public ownership.

Bus Proposal Revived for Cleveland Railway

Legislation designed to have the Cleveland Railway establish three bus lines in Cleveland, Ohio, has been introduced into the Cleveland City Council by Councilman Fielder Sanders, former city street railway commissioner.

Under this legislation the Cleveland Railway would operate three lines, one from the extreme east end of the city to the Public Square and two other feeder lines in the suburbs. The type of bus used would be that of the Fifth Avenue double-deck variety. A 10-cent cash fare would be charged with 1-cent transfer charge from the buses to the street cars, and a 4-cent transfer charge from the street cars to the buses.

It is hardly likely that the Cleveland City Council will act on the legislation until the State Supreme Court has decided the question of whether the Ohio Public Utilities Commission or the Cleveland City Council has the right to grant bus franchises and regulate bus operation in Cleveland.

A decision from the State Utilities Commission on the application of the Cleveland Railway to run buses in Cleveland under the jurisdiction of the State Commission is expected soon. If this decision takes away the right of the Cleveland City Council to regulate buses in Cleveland, the case will be appealed to the State Supreme Court.

C. M. Ballou, City Street Railway Commissioner, has recommended bus operation in Cleveland as "feeder" lines to the main arteries of the Cleveland Railway. In his report to the Council Mr. Ballou said that it is hardly necessary to restate the principle that in any community such as Cleveland all local transportation should be operated under one management.

Officials of the Cleveland Railway have expressed their willingness to undertake bus operation or extensions of the company's present system if the City Council will devise some means of financing expansion by the company. Under the present service-at-cost grant the Cleveland Railway is not permitted to sell stock except at par to obtain new capital. The company's stock is quoted in the local market at about $86 a share, a price which would make it prohibitive for the company to finance a program of extensions or expansion.

The company has asked the City Council to allow it an additional 2 cents a car-mile for operation, so as to bring the allowance for operation up to 28 cents a car-mile. If the Council does this it will increase the company's operating allowances approximately $700,000 a year.

Municipal Subway Suggested

Mayor Hylan of New York City Makes More Promises—Transit Commission and Mayor Still at It

The Board of Transportation of New York City, of which John H. Delaney is chairman, hopes within a few weeks to have ready for public consideration plans for Mayor Hylan's project of an independent municipally owned and operated subway system. Announcement to this effect was made on Nov. 18.

An important feature of these plans is that the trunk line of the system in Manhattan leading to Washington Heights is to be under Sixth Avenue and not under Eighth Avenue, as the Transit Commission had decided.

In undertaking to drive this new subway under Sixth Avenue, it was said, the Board of Transportation has found it necessary to effect some arrangement with the Hudson-Manhattan Railroad, whose tubes run under that thoroughfare between Ninth and Thirty-third Streets. The arrangement, it is believed, provides either for the virtual forfeiture of the franchise of the Hudson tubes uptown extension of one mile and a quarter or, as is thought to be more probable, embodies a joint traffic agreement under which some compromise may be effected looking to utilization of the level now used by the Hudson tubes by the new municipal subway also.

State Transit Commissioner Harkness says that a separate municipally owned and operated subway system, such as Mayor Hylan proposes, would mean three systems instead of two as there are today, and instead of one as there should be. He says it would also mean a triple fare instead of a double fare as there is today and a single fare as there should be. Further, Mr. Harkness said:

> Yet Mayor Hylan attempts to pose as a champion of the 5-cent fare. What the city needs to catch up for Mayor Hylan's long delay in subway construction is to build new lines as rapidly as possible and to build them so as to use every existing agency of transportation to the utmost. Expressing it in another way, the Transit Commission's plan of combination and consolidation will get in terms of added service about $1.50 for every dollar spent while Mayor Hylan's plan for a new independent system will get about 50 cents for each dollar spent.

In this connection it is interesting to note that the Transit Commission has recently made public the following chronological table of the more important moves made by it looking toward action by the city to secure adequate transit relief:

Commission promulgates new subway routes	May 15, 1922
Adopts Brooklyn Crosstown Route	Aug. 30, 1922
Adopts first Central Park West Route	Oct. 3, 1922
Adopts Staten Island Tunnel Route	Oct. 3, 1922
Adopts St. Nicholas Avenue extension of first Central Park West Route	Oct. 6, 1922
Board of Estimate rejects Crosstown Route	Nov. 10, 1922
Board of Estimate rejects other three routes	Nov. 9, 1922
Commission adopts six routes comprising proposed Eighth Avenue-Amsterdam Avenue Line	Nov. 28, 1922
Board of Estimate rejects above six mentioned routes	Dec. 22. 1922
Commission resubmits altered Brooklyn Crosstown and Washington Heights Routes	May 15, 1923
Board of Estimate considers routes at public hearing, and joint conference committee of Commission and Board of Estimate authorized	June 2,1923
Joint conferences held	June and July, 1923
Main portions of Washington Heights and Brooklyn Crosstown Lines approved by Board of Estimate at special meeting	Aug. 3, 1923
Long Island City portion of Crosstown Line approved by Board of Estimate	Aug. 17, 1923
Transit Commission has engineers prepare subway plans, and joint conferences continue between Board and Commission	Aug. to Dec. 31, 1923
Chairman McAneny announces Board of Estimate and Commission substantially in full accord on Brooklyn Crosstown and Washington Heights Routes	Jan. 1, 1924
Work on plans, specifications and forms of contracts for new subways, continued by Transit Commission	Jan. to June, 1924
Board of Estimate takes definite stand rejecting all work of Transit Commission on Washington Heights and Brooklyn Crosstown Lines	June 7, 1924
All construction powers transferred to Board of Transportation	July 1, 1924

On Nov. 14 Chairman McAneny of the Transit Commission received from the secretary of the Board of Estimate a copy of the amended draft of the Mayor's "charges" against the Transit Commission, referred to in a resolution of the board adopted Oct. 24. It will be recalled that Mr. McAneny had warned the Mayor that he would be held accountable for libelous statements. In the revised version the amiable charge of homicide, which the Mayor first made against the members of the Transit Commission, and which, until challenged, he seemed quite willing to employ as a part of his political campaigning, has disappeared, along with other libelous things. The statements that remain relate almost wholly to subjects that are matters of record. The Transit Commission will now lay before the Governor, without expurgation, the complete record of what has occurred in its three years' effort to give the people of New York City transit relief.

While all this has been going on G. M. Dahl, chairman of the board of the Brooklyn-Manhattan Transit Company, has issued under his own name a volume of 117 pages entitled "Transit Truths." Mr. Dahl has taken for his text "Truth Is Mightier Than Abuse." Mr. Dahl has spread before the public the complete record of the attitude of his company with respect to transit matters. There is a 9-page index to make reference to any particular subject easy. There are maps and plates and ads. If any doubt still remains with any member of the public in regard to where Mr. Dahl's company stands it is due to the fact that the doubter either has not got a copy of the book or cannot understand a situation such as that with which Mr. Dahl deals even when the matter has been reduced to its simplest terms.

Electric Railway Exonerated for Chicago Grade Crossing Accident

Complete exoneration for the Chicago Surface Lines was contained in a coroner's jury report on the collision of a street car and a switch train recently in which 10 lives were lost. The case was made an issue in Chicago over the grade crossing peril and interlocking devices were studied by the jurors.

The accident occurred just after midnight of the night of Nov. 1, when the street car, heavily laden with passengers, was struck near an unlighted cut by a coal car at the end of a train of 55 cars pushed by two locomotives.

Inquiry revealed that safety gates across North Avenue were down when the street car stopped. A crippled switchman, later found to be of subnormal mentality, was on the job. When the gates went up several autos passed the car and proceeded across the track. These drivers saw nothing approaching on the railroad, and they recalled that the conductor of the street car had walked across the crossing, looked both ways and signaled the motorman to come on. Midway of the crossing and without any warning the train hit the car.

The jurors unreservedly censured officials of the Chicago, Milwaukee & St. Paul Railroad and ordered that three employees, a brakeman, the yardmaster and the assistant superintendent of terminals be held to the grand jury for manslaughter.

Former Governor Edward F. Dunne was one of the jurors and the others were Chief Justice Harry Olson of the Municipal Court, Henry Barrett Chamberlain, superintendent of the Chicago Crime Commission; County Clerk Robert M. Sweitzer, John Terborgh, vice-president of the Foreman National Bank and a capitalist, and Robert Eitel, proprietor of the Bismarck Hotel.

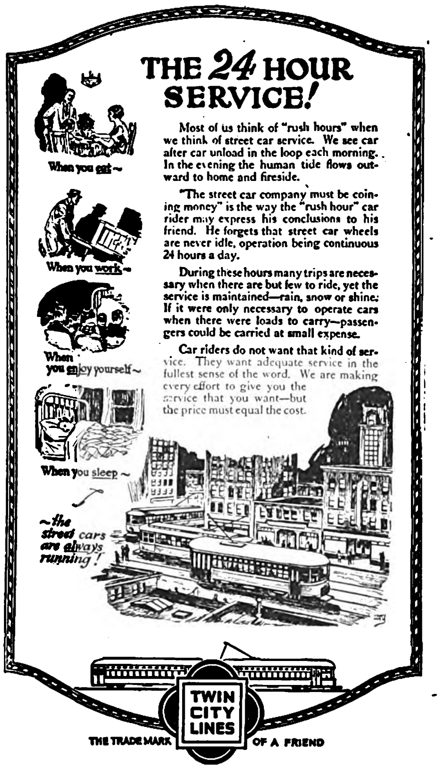
The verdict was rendered on Nov. 11.

Wage Fight in Dayton

Officials and employees of the Dayton Street Railway and the People's Railway of Dayton, Ohio, are in the midst of a wage tangle the present status of which is a deadlock by both sides maintaining their original positions. One of the companies in a bulletin issued recently announced that neither the financial condition nor economic conditions in general warranted an increase in wages; that with regard to the signing of a contract it refused as it always had to operate "a closed shop" but that it was willing at all times to discuss working conditions with its employees. The bulletin was in reply to the submission by the employees of a union agreement calling for "a closed shop" and asking for an increase in wages of 20 cents an hour or 36 per cent. The present scale is 55 cents. The men also sought time and a half for overtime. The advance if granted would mean an increase in the payroll of the Dayton Street Railway of more than $30,000 a year and the People's Railway of $90,000. Reports of strike votes were made, and the company officials stated that the aid of the city would be sought in running the cars. Messrs. Keyes and Powell, officials of the Dayton Street Railway and the People's Railway respectively, announced recently that there was no change in their attitude, that the increased wages could not be granted, but that they would meet with the representatives of the men.

Newspaper Campaign Active in Twin Cities

In addition to the card service on the cars the Twin City Rapid Transit Company is carrying on extensive advertising campaigns in the Twin Cities newspapers. The advertisements give some information on fares collected in various cities of the country and some important statistics on car riding in Minneapolis and St. Paul. Some historical facts on transportation progress in the Twin Cities are recorded. The company states that the passenger revenue has fallen off considerably and that a higher fare will be the result if service and equipment are to be maintained to the standard of the community served. In urging its patrons to ride the cars regularly the company promises a continuation of good management and co-operation.



THE 24 HOUR SERVICE!

Most of us think of "rush hours" when we think of street car service. We see car after car unload in the loop each morning. In the evening the human tide flows outward to home and fireside.

"The street car company must be coining money" is the way the "rush hour" car rider may express his conclusions to his friend. He forgets that street car wheels are never idle, operation being continuous 24 hours a day.

During these hours many trips are necessary when there are but few to ride, yet the service is maintained—rain, snow or shine. If it were only necessary to operate cars when there were loads to carry—passengers could be carried at small expense.

Car riders do not want that kind of service. They want adequate service in the fullest sense of the word. We are making every effort to give you the service that you want—but the price must equal the cost.

Boston & Maine to Run Buses

The Boston & Maine Railroad has definitely decided to go into the motor truck and passenger bus business. For that purpose it has organized the Boston & Maine Transportation Company with a capital stock of $100,000. James H. Hustis, president, has issued an explanatory statement.
